Future Meetings

AASLD/AGA Academic Skills Workshop
January 25 – 26, 2008
Westin Riverwalk
San Antonio, Texas

EASL/AASLD/APASL Hepatitis B and C Virus Resistance to Antiviral Therapies
February 14 – 16, 2008
Paris, France

APASL/AASLD Patient Oriented Research in Liver Disease
March 25, 2008
COEX Convention Center
Seoul, Korea

Digestive Disease Week® (DDW)
May 17 – 22, 2008
San Diego Convention Center
San Diego, California

Hepatology SEP Learning Session
May 21, 2008
During DDW

The Henry M. and Lillian Stratton Basic Research Single Topic Conference
Pathobiology of Biliary Epithelia and Cholangiocarcinoma
June 6 – 8, 2008
Emory Conference Center Hotel
Atlanta, Georgia

Hepatitis Single Topic Conference
HIV and Viral Hepatitis: Lessons Learned
June 19 – 21, 2008
Westin Chicago River North
Chicago, Illinois

Clinical Research Single Topic Conference
Circulatory and Renal Failure in Cirrhosis: Mechanisms and Emerging Therapies
September 5 – 7, 2008
Emory Conference Center Hotel
Atlanta, Georgia

ALEH/AASLD/EASL Postgraduate Course
From Fibrosis to Liver Cancer: Advances in Prevention, Diagnosis, and Treatment
September 15, 2008
Margarita Island, Venezuela

Transplant Hepatology Certification Review Course
September 2008
Westin O’Hare
Chicago, Illinois

59th AASLD Annual Meeting
The Liver Meeting®
October 31 – November 4, 2008
Moscone West Convention Center
San Francisco, California

Endpoints Single Topic Conference
Endpoints in Clinical Trials for Primary Biliary Cirrhosis
December 6, 2008
Emory Conference Center Hotel
Atlanta, Georgia

Call for Nominations

GOVERNANCE

Nominations for the 2009 Governing Board (Councilor, Councilor-at-Large), and the 2009 Nominating Committee will be accepted from regular AASLD members through Thursday, January 31, 2008. Nominations must include a letter of recommendation outlining the nominee’s professional credentials, commitment to the profession, leadership experience, and service to AASLD. Please direct all correspondence to Gregory J. Gores, MD, Chair, 2008 Nominating Committee, AASLD Central Office, 1001 N. Fairfax Street, Suite 400, Alexandria, VA 22314.

Meeting-at-a-Glance

Described for physicians, surgeons, scientists, educators, nurses, physician assistants, and all other hepatology health professionals, The Liver Meeting® is the premier event in the science and practice of hepatology where the cutting edge in the study and treatment of liver and biliary diseases is defined.

The Liver Meeting® continues its tradition of providing a forum for the exchange of groundbreaking research and clinical information in a variety of formats, including workshops, plenary and parallel sessions, poster sessions, scientific exhibits, and State-of-the-Art Lectures.

The majority of events during The Liver Meeting® will take place in the John B. Hynes Convention Center, 900 Boylston Street, Boston, Massachusetts.

Friday, November 2, 2007

8:00 AM - 3:30 PM AASLD/ITRS Transplant Course Hynes, Ballroom A,B,C
10:00 AM - 4:00 PM AASLD/ASGE Endoscopy Course Hynes, 304/306
Noon - 3:00 PM AASLD/PGSHPN Pediatric Symposium Hynes, 302
Noon - 4:00 PM Career Development Workshop Hynes, 210
4:00 - 8:00 PM AASLD Postgraduate Course Hynes, Auditorium

Saturday, November 3, 2007

8:00 AM - 5:15 PM AASLD Postgraduate Course Hynes, Auditorium
2:00 - 8:00 PM Poster Session I Hynes, Hall C
5:30 - 8:00 PM Opening Reception Hynes, Hall D
8:00 PM Industry-supported Satellite Symposium See page 28A for rooms
Midnight Daylight Savings Time ends: turn back your clock one hour

Sunday, November 4, 2007

6:30 - 7:45 AM Networking Breakfast for Women in Hepatology Sheraton, Back Bay B,C
6:45 - 7:45 AM Early Morning Workshops Rooms TBA
8:00 - 9:30 AM Liver Transplant Plenary I Hynes, Auditorium
8:00 AM - Noon Basic Research Workshop Hynes, Ballroom B
8:00 AM - 2:45 PM Hepatology Associates Course Sheraton, Grand Ballroom
8:00 AM - 5:30 PM Poster Session II Hynes, Hall C
9:30 AM - 3:00 PM Exhibits Open Hynes, Hall D
9:30 - 10:00 AM Thomas E. Starzl Transplant Surgery State-of-the-Art Lecture Hynes, Auditorium
10:30 AM - Noon Liver Transplantation II Hynes, Auditorium
Noon - 12:30 PM Hans Popper Basic Science State-of-the-Art Lecture Hynes, Auditorium
1:00 - 2:00 PM 50 Years of Interferons Hynes, Auditorium
1:00 - 4:00 PM NIH Corner Hynes, Ballroom B
2:00 - 3:30 PM Therapeutic Advances in HCC Hynes, Auditorium
3:00 - 4:30 PM General Hepatology Update Hynes, Auditorium
3:00 - 4:30 PM Parallel Sessions
HCV: Pathogenesis Hynes, 312
Hepatobiliary Neoplasia: Clinical and Translational Aspects Hynes, 302
Liver Transplantation Hynes, Ballroom A
Mechanisms of Cell Function and Injury Hynes, 309
Portal Hypertension: Clinical Hynes, 304/306

Monday, November 5, 2007

6:45 - 7:45 AM Early Morning Workshops Rooms TBA
8:00 - 9:30 AM Presidential Plenary I Hynes, Auditorium
8:00 AM - 5:30 PM Poster Session I Hynes, Hall C
9:30 - 10:00 AM Award Presentations Hynes, Auditorium
9:30 AM - 3:00 PM Exhibits Open Hynes, Hall D
10:00 - 10:30 AM Hyman J. Zimmerman Hepatotoxicity State-of-the-Art Lecture Hynes, Auditorium
11:00 AM - 12:30 PM Advances for Practitioners Hynes, Ballroom B
11:00 AM - 12:30 PM Presidential Plenary II Hynes, Auditorium
3:00 - 4:30 PM Parallel Sessions
Acute Liver Failure Hynes, 302
Advances in Pediatric Hepatology Hynes, 311
Basic Mechanisms of Cell Death Hynes, 309
HBV: Preclinical Hynes, Ballroom A
HCV: Virology Hynes, 312
Hepatic Stellate Cell Biology Hynes, 304/306
Steatohepatitis: Clinical Hynes, Ballroom B
Late-breaking Abstracts Hynes, Auditorium

4:45 - 6:15 PM Parallel Sessions
HCV: Epidemiology Hynes, Auditorium
Hepatic Fibrogenesis: In Vivo Models and Clinical Studies Hynes, 304/306
Innate and Adaptive Immunity in Liver Disease Hynes, 311
Signal Transduction and Nuclear Receptors Hynes, 309
Steatosis: Experimental Hynes, Ballroom B
3:00 - 4:30 PM Focused Study Groups (FSG)
Endpoints and Study Design in Clinical Trials in Pediatric Hepatology Hynes, 302
Portopulmonary Hypertension in the Era of Liver Transplantation Hynes, 304/306
7:00 - 9:00 PM AASLD Special Interest Group (SIG) Meeting [Members Only] TBA

Tuesday, November 6, 2007

6:45 - 7:45 AM Early Morning Workshops Rooms TBA
8:00 - 9:30 AM Presidential Plenary III Hynes, Auditorium
8:00 AM - 12:30 PM Poster Session IV Hynes, Hall C
9:30 - 10:00 AM Leon Schiff State-of-the-Art Lecture Hynes, Auditorium
10:00 - 11:00 AM AASLD Business Meeting (Members Only)
11:15 AM - 12:45 PM Parallel Sessions
Advances in the Molecular and Cellular Biology of Bile Formation Hynes, 309
HCV: Clinical Development Strategies II Hynes, Auditorium Noninvasive Assessment of Liver Fibrosis Hynes, Ballroom B
Stem Cell Biology and Differentiation Hynes, 302
All attendees must register to attend the meeting. There are separate registrations and fees for all events held during The Liver Meeting®. You are required to wear your badge to enter the Hynes Convention Center. If you did not receive your badge or pre-register, you are permitted to proceed directly to the registration area to obtain your meeting materials before moving around the center.

If you pre-registered and have your badge and tickets for the meeting, it is not necessary to go to the registration counter. You may go directly to the area marked “Program Distribution” to pick up your meeting bag and materials.

Program Distribution gets very busy just prior to the courses starting. By being early, you will avoid the long lines and not risk missing the start of your course.

All course handouts will be available at Program Distribution.

Course Handout Sales
Course handouts from the Postgraduate Course, Transplant Course, Pediatric Symposium, Research Workshop, Hepatology Associates Course, and the Endoscopy Course are available for sale in the Registration Area beginning Sunday, November 4.

Press Room • Hynes, 107

All course handouts will be available at Program Distribution.

Abstract Downloads
Abstracts selected for presentation at The Liver Meeting® are available for download to a USB drive. The download service is supported by Schering-Plough and is available to all attendees at Schering-Plough's booth # 301 during exhibit hall hours.

Daylight Saving Time Ends
Please be advised that Sunday, November 4, 2007, will start Standard Time. Turn your clocks back one hour Saturday night, November 3.
Shuttle Buses
Shuttle bus service is available from the Park Plaza Hotel and Towers, Radisson Hotel, Hyatt Regency Boston, Hampton Inn, Doubletree, Langham Hotel, Marriott Courtyard Tremont, and Omni Parker House, to the Hynes Convention Center daily beginning at 6:15 AM. Please check for confirmed shuttle times in the hotel and Hynes lobbies.

Cash Luncheons
- Hynes, Main Lobby
  Friday, November 2 – Monday, November 5
- Hynes, Halls C and D
  Saturday, November 3 – Monday, November 5

Boston Information and Restaurant Reservations  •  Hynes, Main Lobby
Attendees may obtain valuable discounts for tours and information about Boston area attractions. You can also make reservations for Boston restaurants here. This desk is open Friday, November 2, through Monday, November 5, from 10:00 AM - 6:00 PM.

Internet Center and Message Center  •  Hynes, Hall A
Keep in touch with home and the office as well as leave messages for other meeting attendees. The Internet Center will be open during regular registration hours. Free wireless service is available throughout the Hynes. Remember, you can also create your meeting itinerary, complete your Liver Meeting® overall evaluation, and print your CME certificate at these workstations.

Business Center  •  Hynes, Main Lobby
FedEx/Kinko’s business center is open from 7:00 AM - 6:00 PM, Friday, November 2 – Monday, November 5, and from 7:00 AM - 1:00 PM on Tuesday, November 6.

Coat Check  •  Hynes, Main Lobby
Cost to check items is $2.00 per piece.

HOURS:
- Friday, November 2 7:00 AM - 8:00 PM
- Saturday, November 3 7:00 AM - 8:00 PM
- Sunday, November 4 6:30 AM - 6:30 PM
- Monday, November 5 6:30 AM - 6:30 PM
- Tuesday, November 6 6:30 AM - 1:00 PM

Local Currency and Banking
The local currency is the U.S. dollar. All major credit cards are accepted at all hotels, shops and restaurants. There are two automatic teller machines (ATM) easily accessible to the Hynes, one at the entrance off Boylston Street (lower level) and one directly outside the entrance to the Prudential Center Mall.

Tips and Gratuities
It is common practice in the U.S. to tip restaurant servers, bellmen, and taxi drivers. The standard tip in restaurants is 18-20 percent. For bellmen and airport baggage handlers, the standard is $1.00 per bag; for taxis 15 percent is acceptable.

First Aid  •  Hynes, Main Lobby
First Aid is located in the Hynes main lobby to the left of Hall A. A registered nurse is available during meeting hours.

Lost and Found  •  Hynes, Main Lobby
Lost items left in meeting rooms may be found in the Hynes Security Office.

Smoking Policy
Smoking is prohibited in the Hynes.

ADA Compliance
The Hynes Convention Center and all participating hotels in The Liver Meeting® are fully accessible to the physically challenged. Anyone who has a need for special assistance should notify the appropriate hotel or the Hynes and indicate the type of assistance needed. AASLD cannot ensure the availability of appropriate assistance without prior notice.
Abstract Embargo
Accepted abstracts are made available to the public on the AASLD Web site and are published in a special supplement of HEPATOLOGY in advance of the meeting. Information contained in those abstracts may not be released until the abstracts appear on the AASLD Web site.

Academic institutions, private organizations, and companies with products whose value may be influenced by information contained in an abstract may issue a press release to coincide with the availability of the abstract on the AASLD Web site. However, AASLD requires information that goes beyond that contained in the abstract (e.g., discussion of the abstract done as part of a scientific presentation or presentation of additional or new information that will be available at the time of the meeting) be under embargo from release to the general public until November 2, 2007, the first day of the meeting. Information released prior to this day is a violation of the AASLD Abstract Embargo Policy and the abstract is subject to withdrawal from The Liver Meeting® program. Authors are responsible for notifying financial and other sponsors about this policy.

Late-breaking Abstracts
AASLD will present late-breaking abstracts
Oral session: 3:00 - 4:30 PM, Hynes, Auditorium
(Monday, November 5)
Poster session: 8:00 AM - 12:30 PM, Hynes, Hall C,
for viewing (Tuesday, November 6); presentation time is
10:00 - 11:30 AM.

Use of AASLD
Scientific Program Content
Information presented during the 58th Annual Meeting is the property of AASLD and the presenter. Information may not be recorded, photographed, copied, photocopied, transferred to electronic format, reproduced, or distributed without the written permission of AASLD and the presenter. Any use of the program content, which includes, but is not limited to oral presentations, audiovisual materials used by speakers, and program handouts, without the written consent of AASLD is prohibited.

Cameras and Cell Phones
Cameras and/or video and audio taping of sessions and posters are strictly prohibited during The Liver Meeting®. Continued use of any type of camera will result in your removal from the meeting venue.

As a courtesy to fellow attendees, please turn off cell phones during education sessions.

Speaker Ready Room • Hynes, 207
All speakers must check in to the Speaker Ready Room a minimum of two hours prior to the start of the speaker’s session. If possible, check in the day before your presentation to ensure a seamless presentation.

HOURS:
Thursday, November 1 ............. 1:00 - 6:00 PM
Friday, November 2 ............... 6:30 AM - 8:00 PM
Saturday, November 3 .......... 6:30 AM - 8:00 PM
Sunday, November 4 ............ 6:30 AM - 6:30 PM
Monday, November 5 ........... 6:30 AM - 6:30 PM
Tuesday, November 6 .......... 6:30 AM - 12:30 PM

View the Best of The Liver Meeting® Online
Enhance your meeting experience or catch a session you may have missed. View the Best of The Liver Meeting® 2007 Online each week starting mid-November. State-of-the-Art Lectures will be available for viewing first, followed by the General Hepatology Update, and the Plenary Sessions. The 2007 Postgraduate Course and Hepatology Associates Course will be available in the spring of 2008. Stop by The Liver Meeting® Online booth located in the main lobby of the Hynes, and sign up for this free service.
Poster Sessions • Hynes, Hall C

The Poster Sessions are important educational events during The Liver Meeting®. The top 10% of posters accepted are designated in the program as a “Presidential Poster of Distinction”. Posters must be dismantled immediately following the viewing time. Posters left on the boards will be removed and discarded.

Presenting authors must be available during presentation times noted below.

Posters should be set-up and viewed during the following times:

**Poster Session I**
Saturday, November 3

- **Set-up** . . . . . . . . . . . . . . . 8:00 AM - 2:00 PM
- **Viewing Time** . . . . . . . . . . . . 2:00 - 8:00 PM
  *Posters must be displayed until 8:00 PM.
- **Presentation Time** . . . . . . . . . 5:30 - 7:00 PM
  *Presenting authors are available to discuss their posters.
- **Dismantle Time** . . . . . . . . . . . 8:00 - 8:30 PM

**Poster Session II**
Sunday, November 4

- **Set-up** . . . . . . . . . . . . . . . 6:30 - 8:00 AM
- **Viewing Time** . . . . . . . . . . . . 8:00 AM - 5:30 PM
  *Posters must be displayed until 5:30 PM.
- **Presentation Time** . . . . . . . . . 1:00 - 2:30 PM
  *Presenting authors are available to discuss their posters.
- **Dismantle Time** . . . . . . . . . . . 5:30 - 6:00 PM

**Poster Session III**
Monday, November 5

  *Presenting authors are available to discuss their posters.
- **Dismantle Time** . . . . . . . . . . . 12:30 - 1:00 PM
Presentation of the Distinguished Service Award to William F. Balistreri, MD

The 2007 Distinguished Service Award will be presented to Dr. Balistreri during Presidential Plenary I at The Liver Meeting® on November 5, 2007. The AASLD Distinguished Service Award is presented annually to an individual in honor of his or her sustained service to AASLD and/or liver disease research. It recognizes the recipient’s lifelong commitment to the field of hepatology, and contribution to AASLD through service on numerous governance and scientific committees over the years.

William F. Balistreri, MD, is director of the Pediatric Liver Care Center and medical director of the Liver Transplantation Program at Cincinnati Children’s Hospital. Dr. Balistreri is professor of pediatrics and medicine at the University of Cincinnati College of Medicine; he has served as director of the Division of Pediatric Gastroenterology, Hepatology, and Nutrition for 25 years. Dr. Balistreri has authored more than 450 publications, including original articles, editorials, reviews, and chapters. He has edited or co-edited several books, including the first multi-authored text on pediatric hepatology and liver disease in children. He has helped to clarify the understanding of many aspects of pediatric hepatology, particularly in the areas of bile acid metabolism, neonatal cholestasis, hepatitis, and liver transplantation. Of significant importance, Dr. Balistreri has served as editor of the Journal of Pediatrics (1995 - present), as well as editor-in-chief of the Journal of Pediatric Gastroenterology and Nutrition (1991-1995).

In addition to being the first pediatrician to serve as president of AASLD, Dr. Balistreri is or has been a member of numerous prestigious, scholarly societies, including the North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition (NASPGHAN) (President 1982–1984), Children’s Digestive Health and Nutrition Foundation (CDHNF) (President 2005 - present), American Board of Pediatrics (Sub-board Chair 1991 - 1993, and Board of Directors 1991 - 1997 and 2000 - 2003), and the American Liver Foundation (Board of Directors 1980 - 1983). He has also served on various committees and study groups in review of grants with the United States Department of Agriculture, the National Institutes of Health, the Department of Health and Human Services, and others.

Dr. Balistreri has received awards from various prestigious societies, including the Distinguished Leadership Award from the Crohn’s & Colitis Foundation of America (1995), the Andrew Sass-Kortsak Memorial Award from the Canadian Liver Foundation and the Canadian Association for the Study of the Liver (1998), the Murray Davidson Award from the American Academy of Pediatrics (AAP) Section on Gastroenterology & Nutrition (1999), the Shwachman Award (1999) from NASPGHAN, the Distinguished Alumnus Award from the University of Buffalo, the Founders Award from the Cincinnati Pediatric Society (1999), the Outstanding Pediatrician of the Year 2001 from the Ohio Chapter of the AAP, and the Daniel Drake Medal from the University of Cincinnati.

Presentation of the Distinguished Achievement Award to Juan Rodés, MD

The 2007 Distinguished Achievement Award will be presented to Dr. Rodés, during Presidential Plenary I at the The Liver Meeting® on November 5, 2007. The AASLD Distinguished Achievement Award is given to an individual in honor of his or her sustained scientific contributions to the field of liver disease and the scientific foundations of hepatology. The award honors a sustained contribution rather than a single discovery or major achievement.

Juan Rodés graduated from the University of Barcelona, School of Medicine in 1967. Hospital Clinic, run by the University of Barcelona Department of Medicine, has been his professional base where he has held a variety of different posts: medical director (1984 - 1986), director of research (1997 - 2003), and, since 2003, the hospital’s director general.

In 1972 he created and led the Liver Unit, which has gained international recognition for its work and research. He has published more than 470 original articles in the top ranking journals dedicated to the speciality, contributed more than 100 book chapters, and has been editor of 29 books.

In 1993 he founded and became the director of the Institute of Biomedical Investigation August Pi y Sunyer (IDIBAPS). He has been awarded various different honours, one of the most important being the National Award for Medical Investigation ‘Gregorio Marañon’ in 2006.

PSC Partners Seeking a Cure Award for the Most Promising PSC Research

The 2007 award recipient is Tom H. Karlsen, MD.

PSC Partners Seeking a Cure is a non-profit foundation whose three-fold mission is to:

- Raise funds with which to research the causes and cures of primary sclerosing cholangitis (PSC),
- Promote PSC and organ donation awareness, and
- Provide education and support to PSC patients and their families.

Towards the goal of encouraging PSC research, the foundation offered an award to be presented at The Liver Meeting®. The annual award was given to the investigator presenting the most promising PSC research at the meeting.

Support of the PSC Partners Seeking a Cure Award for the Most Promising PSC Research by PSC Partners is gratefully acknowledged.

AASLD Student Research Award

This award is given to students who made a major contribution to the research study in the abstract submitted to the Annual Meeting. The 2007 award recipients are Montserrat Moreno and Michael Passeri. Dr. Moreno will present his abstract during the Hepatic Fibrogenesis Parallel Session. Dr. Passeri will present his abstract at the Alcohol: Clinical and Experimental Poster Session.

AASLD Young Investigator Travel Awards

These awards enable young researchers submitting abstracts for the AASLD Research Workshop to receive travel support. The 2007 award recipients are:

- Malte Heeg – Dr. Heeg will make a presentation during the Innate and Adaptive Immunity in Liver Diseases Parallel Session.
- Gadi Lalazar – Dr. Lalazar will make a presentation during the Innate and Adaptive Immunity in Liver Diseases Parallel Session.
- Ichiyo Hose – Dr. Hose will make a presentation during the Viral Hepatitis-Pathobiology Poster Session.
- Hyun Young Woo – Dr. Woo will make a presentation during the Clinical Liver Transplantation and Liver Surgery Poster Session.
- Mark Claassen – Dr. Claassen will make a presentation during the Inflammation and Immunobiology Poster Session.
- Maria Longhi – Dr. Longhi will make a presentation during the Cholestatic and Autoimmune Liver Disease Poster Session.
- Masashi Sasaki – Dr. Sasaki will make a presentation during the Inflammation and Immunobiology Poster Session.

AASLD Pediatric Fellow Research Award

The purpose of this award is to foster excellence in pediatric liver disease research. The award is given to a physician/scientist with a primary appointment affiliation in a department of pediatrics. The 2007 recipient is Ursula Matte. Dr. Matte will make a presentation during the Advances in Pediatric Hepatology Parallel Session.

AASLD Fellow Research Award

This prize is awarded for the best abstract submitted by a fellow. The 2007 recipient is Puneet Puri. Dr. Puri will make a presentation during the Presidential Plenary III Session.

AASLD/ALF Liver Scholar Award

The AASLD/ALF Liver Scholar Award is a three-year, basic science award of $75,000 per year that endeavors to encourage young investigators to pursue a career in liver-related research. The goal of the program is to permit scientists to bridge the gap between completion of research training and attainment of status as an independent research scientist. This additional research experience should enable them to compete for research grants from national sources, particularly the NIH. Recipients of these awards include:

2007 - 2009

- Rongze Yang, MD, PhD • University of Maryland, Baltimore
  PROJECT TITLE: Isoform-specific ALT Assay and its Application in Liver Disease

- Carlo Spirli, PhD • Yale University
  PROJECT TITLE: Epithelial Angiogenic Signaling in Polycystic Diseases of the Liver

2006 – 2008

- Lynette A. Gillis, MD • Vanderbilt University
  PROJECT TITLE: Mitochondrial Short-chain 3-Hydroxyacyl-CoA Dehydrogenase in Hyperinsulinism and Hepatic Steatosis

- Li Wang, PhD • The University of Kansas Medical Center
  PROJECT TITLE: Nuclear Receptor SHP – Mediated Regulation of Hepatic Lipid Homeostasis

2005 – 2007

- Antonia Follenzi, MD, PhD • Albert Einstein College of Medicine
  PROJECT TITLE: Mechanisms of Lentiviral Gene Transfer in Liver Sinusoidal Endothelial Cells

- Arumugam Jayakumar, MD • University of Miami
  PROJECT TITLE: Intracellular Signaling in Ammonia-induced Astrocyte Swelling: Potential Role in Brain Edema in Acute Liver Failure
**AASLD Jan Albrecht Commitment to Clinical Research in Liver Diseases Award**

Janice K. Albrecht, PhD, is vice president, hepatology clinical research for Schering-Plough Research Institute, the pharmaceutical research arm of Schering-Plough Corporation. Dr. Albrecht joined Schering-Plough Research Institute in 1981, was appointed to her present position in 1997, and is responsible for the planning, management, and oversight of Schering-Plough’s research and development program across the hepatology and gastroenterology therapeutic areas, including the treatment of viral hepatitis. Dr. Albrecht earned a BS degree from Iowa State University, an MS degree from Roosevelt University, Chicago, Illinois, and her PhD in pharmaceutics from Temple University, Philadelphia, Pennsylvania. Her work has been published in leading scientific journals.

The purpose of the AASLD Jan Albrecht Commitment to Clinical Research in Liver Diseases Award is to foster career development for individuals performing clinical research and/or translational research in a liver-related area and who have shown commitment to excellence at an early stage of their research study. Recipients of this two-year award include:

**2007 - 2009**

Patrick G. Northup, MD • University of Virginia
PROJECT TITLE: *Clinical, Inflammatory, and Economic Impact of Dextran-70 in Treating SBP*
MENTOR: Carl L. Berg, MD

**2006 - 2008**

George N. Ioannou, BMBCh, MS • University of Washington
PROJECT TITLE: *Liver Transplantation for Hepatocellular Carcinoma in the MELD Allocation Era*
MENTOR: Robert L. Carithers, Jr, MD

**2005 - 2007**

Scott W. Biggins, MD • University of California, San Francisco
PROJECT TITLE: *Selection Bias in Re-transplantation Survival Models: The Impact of Listing Criteria and Hepatitis C*
MENTOR: Norah Terrault, MD, MPH

Support of the AASLD Jan Albrecht Commitment to Clinical Research in Liver Diseases Award by Schering-Plough is gratefully acknowledged.

**AASLD Sheila Sherlock Clinical and Translational Awards in Liver Diseases**

Dame Sheila Sherlock began her study in medicine in 1936 at Edinburgh University. She graduated MB, BCh (summa cum laude) in 1941, and at the top of her class, won the Ettles Scholarship. As a woman, she was unable to receive an internship at the Royal Infirmary and became clinical assistant to the Professor of Surgery where she was introduced to medical research. In 1942, she began her pioneering career in hepatology at Hammersmith Hospital and the Postgraduate Medical School. In 1943, she co-published a paper on the pathology of acute hepatitis. This work was the basis of her thesis for an Edinburgh MD (and gold medal) in 1945. She proceeded to study the biochemistry of the liver and its disorders. In 1947, she was awarded a Rockefeller traveling fellowship and went to the Department of Physiological Chemistry at Yale. A year later, at the age of only thirty, she returned to Hammersmith as Lecturer and Honorary Consultant Physician. Within a few short years, she and her liver unit were famous, attracting research fellows from around the world. In 1959, she was the first woman appointed to the Chair of a British Department of Medicine at the Royal Free Hospital School of Medicine.

Some of the numerous contributions Sheila and her co-workers at the Royal Free made to hepatology include:

- Linked the hepatitis B virus (when it was still the “Australia antigen”) to the development of cirrhosis and hepatocellular carcinoma, and studied the role of sexual transmission and male homosexuality.
- Introduced the antimitochondrial antibody as a test for primary biliary cirrhosis.
- Recognized the benefit of immunosuppression with prednisolone for autoimmune hepatitis.

Numerous papers were also produced including classics on Wilson’s disease, hemochromatosis, Budd-Chiari syndrome, extrahepatic portal vein block, partial nodular transformation of the liver, and primary sclerosing cholangitis.

Dame Sheila Sherlock wrote, edited, and contributed to many works, most notably *Diseases of the Liver and Biliary System*, which, in its eleventh edition, remains a classic and is translated into several languages.

The purpose of the AASLD Sheila Sherlock Clinical and Translational Awards in Liver Diseases is to foster career development for individuals performing clinical research and/or translational research in a liver-related area and who have shown commitment to excellence at an early stage of their research study. Recipients of these two-year awards include:

**2007 - 2009**

Matthew Cave, MD • University of Louisville
PROJECT TITLE: *Environmental Toxins and Non-alcoholic Fatty Liver Disease*
MENTOR: Craig McClain, MD

Support of the AASLD Sheila Sherlock Clinical and Translational Awards in Liver Diseases by Schering-Plough is gratefully acknowledged.
**AASLD Awards (continued)**

**Tamar H. Taddei, MD, PhD • Yale University School of Medicine**

**PROJECT TITLE:** Phenotypic and Pathophysiologic Determinants of the Hepatobiliary Manifestations of Gaucher Disease  
MENTOR: Pramod K. Mistry, MD, PhD  
2006 – 2008

**Ningling Kang-Decker, PhD • Mayo Foundation**

**PROJECT TITLE:** Mechanism of Nitric Oxide Inhibition of Hepatic Stellate Cell Migration in Liver Metastasis of Pancreatic Cancer  
MENTOR: Vijay Shah, MD

**Ravi R. Jhaveri, MD • Duke University Medical Center**

**PROJECT TITLE:** Investigating the Pathogenesis of Steatosis in Hepatitis C Genotype 3 Infection  
MENTOR: Anna Mae Diehl, MD  
2005 - 2007

**Kathleen M. Campbell, MD • Cincinnati Children’s Hospital Medical Center**

**PROJECT TITLE:** Pharmacogenetics of Posttransplant Renal Dysfunction  
MENTOR: William F. Balisteri, MD

**Aaron Robert Turkish, MD • Columbia University**

**PROJECT TITLE:** DGAT1 and the DGAT2 Gene Family in Nonalcoholic Fatty Liver Disease  
MENTOR: Stephen L. Sturley, PhD

Support of the AASLD Sheila Sherlock Clinical and Translational Awards in Liver Diseases by Roche is gratefully acknowledged.

**AASLD Career Development Award in Liver Transplantation**

The purpose of this award is to foster career development for a junior faculty member performing clinical and/or translational research in the field of liver transplantation and who has shown commitment to excellence in the field at an early stage of his or her career. The 2007 recipient will be announced at the meeting.  
Support of the AASLD Career Development Award in Liver Transplantation by Astellas USA Foundation is gratefully acknowledged.

**AASLD Advanced/Transplant Hepatology Fellowship Program**

This one-year award of $60,000 provides salary and benefit support for gastroenterology fellows pursuing an additional full year of training focused on patient care in advanced/transplant hepatology. The intent of the program is to prepare the trainee to be eligible for certification in transplant hepatology by the American Board of Internal Medicine (ABIM). The 2007 recipients are:

- **Karin L. Anderson • Massachusetts General Hospital**  
  MENTOR: Raymond T. Chung, MD
- **Ottar M. Bergman • University of Iowa Hospitals and Clinics**  
  MENTORS: Kyle E. Brown, MD and Michael D. Voight, MD
- **Virginia C. Clark • University of Florida**  
  MENTORS: David R. Nelson, MD and Mark L. Brantly, MD
- **Linda A. DiTeodoro • Mayo Clinic Jacksonville**  
  MENTOR: Andrew P. Keaveny, MD
- **Stevan A. Gonzalez • Stanford University School of Medicine**  
  MENTOR: Emmet B. Keeffe, MD
- **Karen L. Krok • Johns Hopkins University**  
  MENTOR: Paul J. Thuluvath, MD
- **Christine K. Lee • Children’s Hospital Boston**  
  MENTOR: Maureen M. Jonas, MD
- **Glen A. Lutchman • University of California, San Francisco**  
  MENTOR: Norah A. Terrault, MD, MPH
- **Amy C. McClune • Mount Sinai School of Medicine**  
  MENTOR: Paul Martin, MD
- **Kerry N. Whitt • Mount Sinai Hospital**  
  MENTOR: Thomas D. Schiano, MD

Support of the 2007 Advanced/Transplant Hepatology Fellowship Program by Bristol-Myers Squibb, Roche, and Schering-Plough is gratefully acknowledged.

**AASLD NP/PA Clinical Hepatology Fellowship Program**

Designed to increase the number of mid-level practitioners in clinical hepatology, the purpose of this program is to provide salary and benefit support for certified and licensed physician assistants (PA) or nurse practitioners (NP) pursuing a full year of training focused on clinical care in hepatology. The 2007 recipients are:

- **Foong-chee (Joann) Cheah • The Liver Institute at Methodist Dallas**  
  MENTOR: Reem H Ghalib, MD
- **Joseph P. Colagreco • Beth Israel Deaconess Medical Center**  
  MENTOR: Nezam H. Afshal, MD
- **Cheryl C. Collins • MetroHealth Medical Center**  
  MENTOR: Kevin D. Mullen, MD
- **Marlene A. Gross • Hospital of the University of Pennsylvania**  
  MENTOR: K. Rajender Reddy, MD
- **Jessica G. Irwin • University of California, San Francisco**  
  MENTOR: Norah Terrault, MD, MPH
- **Krissy M. Kegley • Piedmont Hospital**  
  MENTOR: Roshan Shrestha, MD
- **Debra A. Narcisse • Mount Sinai School of Medicine**  
  MENTOR: Paul Martin, MD
- **Marion M. Weich • Mayo Clinic Arizona**  
  MENTOR: Thomas J. Byrne, MD
- **Deanna H. White • University of Colorado Health Sciences Center**  
  MENTOR: Gregory T. Everson, MD

Support of the 2007 AASLD NP/PA Clinical Hepatology Fellowship Program by Roche and Schering-Plough is gratefully acknowledged.
AASLD Governing Board

OFFICERS AND EXECUTIVE COMMITTEE

Public policy issues having a direct impact on the discipline are actively monitored and communicated by AASLD’s Public Policy Committee, which makes recommendations to influence issues as they are raised in the nation’s capital. The AASLD 2007 Public Policy Agenda developed by the Public Policy Committee and approved by the Governing Board follows.

Global
AASLD will continue to implement a policy and public relations program focused on liver health. Specifically, AASLD will (a) further develop and implement a strategy for making ALT levels analogous to cholesterol levels with the public, (b) finalize a white paper that summarizes the state of the science, and (c) begin to work with the NCQA on the creation of a HEDIS standard related to ALT levels.

Research Issues
AASLD strongly supports funding for scientific research and training throughout the federal government. Specifically:

- AASLD supports the highest attainable funding levels to rapidly advance progress throughout the NIH as envisioned by the Trans-NIH Action Plan for Liver Disease Research (TAPLDR), adopted by NIDDK in 2004.
- AASLD supports legislation to reauthorize NIH and non-legislative revisions in structures and processes at NIH only to the extent they enhance the implementation of the TAPLDR. AASLD opposes changes in the structure of NIH that, in its judgment, have the potential to siphon off research funds from liver-related research.
- AASLD supports the highest attainable funding levels for liver research through the Department of Veterans Affairs and other agencies.
- AASLD supports keeping all functions of the Armed Forces Institute of Pathology (AFIP) (its consultive services, education and training, and research) consolidated and available to researchers both within and without government.

Patient Care Issues
AASLD supports federal policies that will improve and enhance medical treatment for patients with liver disease, and promote liver wellness. Specifically:

- AASLD supports the provision of liver health care to all Americans, regardless of ability to pay.
- AASLD supports the highest attainable level of federal funding for states’ efforts to prevent the spread of infectious liver diseases (particularly viral hepatitis), and to diagnose and treat those who are already infected.

- AASLD supports developing legislation to create a chronic liver disease program at the Centers for Disease Control and Prevention (CDC).
- AASLD strongly encourages the FDA to address aggressively adverse events caused by inadvertent overdoses of acetaminophen, particularly related to compound drugs.
- AASLD supports an aggressive effort to diagnose and treat liver disease for veterans under the jurisdiction of the Veterans Health Administration.

Transplantation-related Issues
AASLD supports aggressive federal action to increase the number of cadaveric and living donor organs, including livers, available to be transplanted into patients who are eligible pursuant to current transplantation standards.

- AASLD supports increasing funding to promote organ donation programs directly by the federal government, as well as through the states, to the highest attainable levels.
- AASLD supports continuing research at the NIH designed to reduce the need for organs to be transplanted and designed to improve outcomes from transplantation.

Key Tactics
To fulfill its agenda, AASLD will increase its visibility as the premiere scientific organization dedicated to the prevention and cure of liver disease and promotion of liver wellness. AASLD will:

- Meet regularly with key leaders in NIH, CDC, FDA, and other agencies, as well as in Congress. A list of these leaders will be updated annually.
- Inform decision makers via letters, emails, and meetings concerning its accomplishments in liver education and important research breakthroughs made by AASLD members.
- Provide contact information sheets to ensure that the expert testimony of its members will be at the disposal of the press, state and national officials.
- Support the Governing Board in its efforts to obtain greater public recognition of liver disease and of AASLD’s effort to fight it. Use this as a basis for press releases, press conferences, high visibility meetings, awards, etc., as appropriate.
- Continue to refine policy statements on issues facing liver disease research and patient care. When approved, these statements will be posted on AASLD’s Web site and distributed to all potential ad hoc partners.
- Work in partnership with government, industry, and other nonprofit patient and professional associations to achieve these aims.
AASLD gratefully acknowledges and thanks its corporate supporters whose generosity and educational grants make many features of The Liver Meeting® possible. As of July 1, 2007, the following commitments have been received in support of The Liver Meeting®:

**Bristol-Myers Squibb Company**
- Online Abstract Viewer and Itinerary Planner
- Meeting Planner Notebook

**GILEAD**
- Boston City Guide & Map
- Flag Highlighter Pen

**Roche**
- Registration Bags

**Schering-Plough**
- The Liver Meeting® Abstracts USB Download
- Final Program
The Exhibit Hall, an informative and important component of The Liver Meeting®, provides you with a valuable opportunity to meet with representatives from various organizations that are committed to the field of hepatology. A complete listing of Exhibitors and their product descriptions begins below.

Arbios Systems, Inc.  
Booth # 101  
8797 Beverly Blvd.  
Suite 304  
Los Angeles, CA 90048  
Phone: 310-657-4898  
Fax: 310-657-4879  
Website: www.arbios.com  

Arbios Systems, Inc. is a medical device and cell-therapy company focused on the development of products for the treatment of liver failure. Our lead product currently in clinical trials is the SEPET™ Liver Assist Device, a novel extracorporeal blood purification therapy using a specially designed hollow fiber cartridge.

Asklepion Pharmaceuticals, LLC  
Booth # 125  
5200 Maryland Way  
Suite 204  
Brentwood, TN 37027  
Phone: 615-377-4617  
Fax: 615-467-3083  
Website: www.asklepionpharm.com  

The corporate vision is that of a company focused on researching, developing, and marketing biopharmaceutical products for the unmet or underserved needs of patients afflicted with liver-based diseases. Asklepion is developing products which range from small, orphan products to blockbuster products.

Astellas Pharma US, Inc.  
Booth # 535  
3 Parkway North  
Deerfield, IL 60015  
Phone: 800-888-7704  
Fax: 847-317-5953  
Website: www.astellas.com  

Astellas Pharma, Inc. manufactures and markets proprietary pharmaceutical products in specialty therapeutic areas where there is an unmet medical need. Astellas Pharma’s global mission to explore the frontiers of human health underscores the company’s commitment to the field of immunology, where aggressive research and development initiatives have helped to put Astellas at the forefront of transplantation.

Bayer Healthcare Corporation & Onyx Pharmaceuticals, Inc.  
Booth # 107, 109  
400 Morgan Lane  
West Haven, CT 06516  
Phone: 203-812-2000  
Website: www.bayer.com  
www.onyx-pharm.com  

Bayer Oncology is committed to combining our passion for science, discovery and innovation to help improve the lives of cancer patients. We invite you to learn more about Bayer Oncology and NEXAVAR (sorafenib) tablets, for the treatment of patients with advanced renal cell carcinoma.

Axcan Pharma  
Booth # 104, 205, 207  
597 Laurier Blvd.  
Mont-Saint-Hilaire, QC J3H 6C4  
Canada  
Phone: 450-467-5138  
Fax: 450-467-3067  
Website: www.axcan.com  

Axcan is a leading multinational specialty pharmaceutical company focused on gastroenterology. The company develops and markets a broad line of prescription products to treat a range of gastrointestinal diseases and disorders such as inflammatory bowel disease, irritable bowel syndrome, cholestatic liver diseases, and complications related to pancreatic insufficiency.

Bristol-Myers Squibb  
Booth # 128, 325  
PO Box 4500  
Princeton, NJ 08543-4500  
Phone: 609-897-2000  
Fax: 609-897-6722  
Website: www.bms.com  

Bristol-Myers Squibb welcomes you to Boston! We invite you to visit our exhibit and welcome the opportunity to meet our representatives to discuss the products and services we have to offer.

Centers for Disease Control & Prevention  
Booth # 7  
1600 Clifton Road, NE  
MS: G37, DVH CDC  
Atlanta, GA 30329  
Phone: 404-718-8525  
Fax: 404-718-8595  
Website: www.cdc.gov/hepatitis  

CDC’s Division of Viral Hepatitis offers expertise on preventing and controlling viral hepatitis. Recommendations, guidelines, surveillance forms, disease burden data, and other publications on the epidemiology and prevention of viral hepatitis are available at www.cdc.gov/hepatitis. Training curricula, courses, posters, brochures, slide sets, and fact sheets are also available.

Chronic Liver Disease Foundation  
Booth # 637  
1199 Raritan Road  
Clark, NJ 07066  
Phone: 973-644-9777  
Fax: 973-939-8516  
Website: www.chronicliverdisease.org  

The Chronic Liver Disease Foundation is a nonprofit 501(c)(3) educational organization dedicated to increasing awareness of the effect of chronic liver disease (CLD) in the United States. The foundation’s goal is to provide health professionals with the most current education and information on CLD.
Clinical Care Options

1894 Preston White Drive
Suite 110
Reston, VA 20191
Phone: 970-513-9174  Fax: 866-691-8321
Website: www.clinicaloptions.com

Clinical Care Options (CCO) is the leader in the development of innovative interactive medical education programs for hepatitis healthcare professionals. CCO creates and publishes original continuing medical education and information resources that translate the latest developments in science and medicine into treatment options. Available online at: http://clinicaloptions.com/hepatitis.

The Cochrane Hepato-Biliary Group

Rigshospitalet
Dept. 3344
Copenhagen, DK-2100
Denmark
Phone: 45-3545-7169  Fax: 45-3545-7101
Website: http://ctu.rh.dk/chbg

The CHBG is a non-profit, international clinical research group with 1200+ members. Cochrane systematic reviews of interventions for hepatic and biliary diseases are our main product. 163 peer-reviewed protocols for systematic reviews and 80 systematic reviews are published in Issue 3, 2007. A CHBG Register with 11,000 references on randomised or controlled clinical trials is maintained in CENTRAL database in The Cochrane Library. Cochrane reviews are independent of industry interests and funding.

Corgenix, Inc.

11575 Main Street
Suite 400
Broomfield, CO 80020
Phone: 303-457-4345  Fax: 303-457-4519
Website: www.corgenixonline.com

Corgenix, Inc. develops, manufactures, and markets clinical diagnostic products for autoimmune and vascular (thrombosis) disorders, as well as the Hyaluronic Acid Test Kit for the early detection of liver fibrosis and cirrhosis. Corgenix is based in metropolitan Denver, Colorado with its international office near Cambridge, England.

CuraScript Inc.

6272 Lee Vista Blvd.
Orlando, FL 32811
Phone: 888-773-7376  Fax: 888-773-7386
Website: www.curascript.com

CuraScript is a leading specialty pharmacy provider of healthcare products and services to individuals with chronic health conditions such as asthma, growth hormone deficiencies, hepatitis C, hemophilia, HIV/AIDS, oncology, multiple sclerosis, and rheumatoid arthritis. CuraScript’s patient management services include clinical case management, counseling, education, outcomes measurement, social services, and reimbursement services.

Cylex, Inc.

8980-I Old Annapolis Road
Columbia, MD 21045
Phone: 410-964-0236  Fax: 410-964-0367
Website: www.cylex.net

Cylex® manufactures the only FDA-cleared assay measuring the vitality of patients’ immune systems from a single drop of blood. ImmuKnow® enables physicians to better manage and individualize treatments for life-threatening diseases, such as HIV, HCV, cancer, and autoimmune disorders, as well as solid organ and bone marrow transplantation.

Digestive Care, Inc.

1120 Win Drive
Bethlehem, PA 18017
Phone: 610-882-5950  Fax: 610-882-0349
Website: www.digestivecare.com

Digestive Care, Inc. (DCI) is dedicated to developing unique pharmaceutical products to alleviate complications and symptoms of gastrointestinal disorders. DCI’s research into the controlled delivery of gastric acid resistant digestive enzymes and buffered bile acids through micro encapsulation led to the development of the highly successful drug product, PANCRECARB® (pancrelipase).

Duke Clinical Research Institute

2424 Erwin Road
Suite 402
Durham, NC 27705
Phone: 919-668-8700  Fax: 919-668-7114
Website: www.dcri.org

The Duke Clinical Research Institute (DCRI) offers a unique combination of clinical expertise, academic leadership, operational capabilities, and business acumen that translates into targeted and sound research results. With thought-leaders who stay at the cutting edge of scientific discovery and industry trends, our efforts consistently help sponsors to be not only first to market, but also first to peak sales. The DCRI... more than a CRO.
EchoSens
153 Avenue D’Italie
Paris, 75013
France
Phone: 33-1-44-82-78-50 Fax: 33-1-44-82-78-60
Website: www.echosens.com

Created in 2001, EchoSens is a French company specializing in innovative medical devices based on its own discovery, the transient elastography. Its first device, the FibroScan® and its dedicated probe, has quickly become a reference and is supported by worldwide medical practitioners, hepatologists and professionals in other pathologies. Totally non-invasive and painless, our device enables users to quantify liver fibrosis.

Elsevier
PO Box 390
Humarock, MA 02047
Phone: 781-837-0797 Fax: 781-837-1437

SAUNDERS, MOSBY, CHURCHILL LIVINGSTONE AND BUTTERWORTH, a combined premier worldwide medical and health science publishing company, under the umbrella of ELSEVIER, presents our latest titles in healthcare. Come visit our booth and browse through our complete selection of publications.

European Association for the Study of the Liver (EASL)
PO Box 1726 – 17, rue du Cendrier CH-1211, Geneva Switzerland
Phone: 41-22-906-9151 Fax: 41-22-732-2607
Website: www.easl.ch

The essential mission of the EASL is to promote liver research and to improve the treatment of liver disease throughout the world. As an active advisor to the European/National Health authorities, EASL aims to raise public awareness in liver disease and attempts to fulfill its mission by forging friendships and linkages amongst hepatologists around the world. This is mainly done through its annual meeting and educational programs.

Evivar Medical
501/100 Victoria Parade
E. Melbourne, VIC 3002 Australia
Phone: 613-9662-4900 Fax: 613-9662-4933

Evivar Medical is a joint venture company established to develop and commercialise SeqHepB, a web-based program incorporating Hepatitis B virus mutations associated with antiviral drug resistance. Evivar and its consortium partners have built an extensive patent portfolio that includes recent discoveries associated with multiple pathways of evolution of HBV drug-resistance as well as cross-resistance and multi-drug resistance.

Gambro AB
Scheelevagen 34
PO Box 10101
Lundia, SE-22010
Sweden
Phone: 46-70-8589212 Website: www.gambro.com

Over the last 40 years, Gambro has been a world leading company in renal therapy, with sales, service, and support in more than 100 countries. Through extensive investment in research and development, and in cooperation with leading clinicians and scientists worldwide, we are able to provide high quality, innovative, therapy-enhancing products and services. With the MARS Therapy, Gambro proudly introduces the first unified approach to hepatic & renal support therapy for severe liver failure. Please visit our booth and we will explain further to you about our offerings.

Gastroenterology & Hepatology
611 Broadway
Suite 310
New York, NY 10012
Phone: 212-995-5522 Fax: 212-995-5572
Website: www.clinicaladvances.com

Gastroenterology & Hepatology is a monthly, independent peer reviewed journal circulated to all U.S. gastroenterologists, pediatric gastroenterologists, colon/rectal surgeons, hepatologists, and 2,800 primary care physicians (total circulation = 16,200+). Our mission is to contribute to the advancement of these fields by providing indispensable editorial content. Gastroenterology & Hepatology fulfills the need of practicing physicians for a journal containing the most up-to-date clinical information in gastrointestinal disorders, including diseases of the liver and biliary tract.

Gilead Sciences, Inc.
333 Lakeside Drive
Foster City, CA 94404
Phone: 650-574-3000 Fax: 650-578-9264
Website: www.gilead.com

Gilead Sciences is a biopharmaceutical company that discovers, develops, and commercializes therapeutics to advance the care of patients suffering from life-threatening disease worldwide. For more information, please visit www.gilead.com.
GlaxoSmithKline is one of the world’s leading research-based pharmaceutical companies with a powerful combination of skills to discover and deliver innovative medicines. In support of the appropriate use of our products, GlaxoSmithKline offers a number of programs to support our mutual goals to achieve effective health management strategies and improve patient care. Please visit our exhibit to learn more about our products and programs.

HepaHope, Inc. is dedicated to the development and commercialization of technologies that aid in the treatment of diseased livers. HepaHope presents the HepaPheresis Instrument™, a Bio-Artificial Liver (BAL) system that leverages HepaHope’s platform organ slice technology to replicate normal liver functionality, acting as a treatment bridge to liver transplant.

The Hepatitis Foundation International (HFI) conducts Foundation for Decision Making Training sessions promoting healthy lifestyle behaviors and prevention of viral hepatitis. HFI also conducts education programs for health professionals, teachers, nurses, community leaders, substance abuse counselors, and the public.

Cheng Si Yuan (China – International) Hepatitis Research Foundation is an independent charitable organization founded by the Vice-Chairman of the National People’s Congress, PR China, The Hon Cheng Si-yuan and The Hon Wu Jieping as well as the late Mr James Lau in 1998. Aimed at improving the health standard of Chinese people, the Foundation will recruit the most reputable and top hepatologists from Mainland China, Hong Kong, Taiwan and overseas together to exchange views and knowledge on hepatology research, and to improve the standard of prevention, diagnosis and treatment of liver diseases.

Humana Press is a worldwide publisher of books and journals in molecular biology, neuroscience, cancer research, and medicine. Humana publishes approximately 150 book titles per year as well as a number of successful non-series titles and has a backlist of approximately 1,700 titles and a portfolio of 25 journals. Humana’s clinical series include Contemporary Cardiology™ and Current Clinical Practice™, Contemporary Endocrinology™, Contemporary Diabetes™, Current Clinical Urology™s, Current Clinical Oncology™, Forensic Science and Medicine™, and Nutrition and Health™.

Idenix Pharmaceuticals and Novartis Pharma AG have created an alliance that seeks to bring the world new therapeutic options for the treatment of hepatitis. This alliance is committed to shaping the future of hepatitis therapy by investigating and introducing innovative medicines that may offer physicians additional tools for disease management and, ultimately, improved outcomes for patients.

Idenix Pharmaceuticals Booth # 313
One Kendall Square
Bldg. 1400
Cambridge, MA 02139
Phone: 617-995-9230 Fax: 617-577-1715
Website: www.idenix.com

Idenix Pharmaceuticals and Novartis Pharma AG have created an alliance that seeks to bring the world new therapeutic options for the treatment of hepatitis. This alliance is committed to shaping the future of hepatitis therapy by investigating and introducing innovative medicines that may offer physicians additional tools for disease management and, ultimately, improved outcomes for patients.
Innogenetics, Inc.  
2580 Westside Parkway  
Suite 400  
Alpharetta, GA 30004  
Phone: 678-393-1672  
Fax: 678-393-1673  
Website: www.innogenetics.com

Innogenetics is an international biopharmaceutical company building parallel businesses in specialty diagnostics and therapeutic vaccines. Its Diagnostics Division develops a number of specialty products, especially for infectious diseases (hepatitis C, hepatitis B, HIV, and HPV). Within the field of hepatitis, Innogenetics has developed leading assays for genotyping of hepatitis C virus (a prototype drug resistance assay is under development), as well as genotyping, drug resistance, and pre-core mutants of hepatitis B virus.

INOVA Diagnostics, Inc.  
9900 Old Grove Road  
San Diego, CA 92131  
Phone: 858-586-9900  
Fax: 858-586-9911  
Website: www.inovadx.com

INOVA Diagnostics, Inc. develops, manufacturers and sells a complete menu of autoimmune disease diagnostic kits and components for screening and specific autoantibody determinations. Product groups include kits and components for rheumatoid arthritis, connective tissue disease, coagulation, gastrointestinal, Vasculitis, endocrine, and autoimmune liver disease.

InScope  
4545 Creek Road  
Cincinnati, OH 45242  
Phone: 513-337-7000  
Fax: 513-337-1225  
Website: www.ethiconendo.com

InScope, a division of Ethicon Endo-Surgery, Inc., is committed to the development of Endoscopic devices designed to make a difference in clinical practice. By creating practical, innovative, and procedure-enabling devices, InScope is dedicated to enhancing the future of everyday Endoscopy.

International Association for the Study of the Liver (IASL)  
StMUGV-ref: 31  
P.O.B. 810140  
Munich, 81901  
Germany  
Phone: 49-89-9214-2141  
Fax: 49-89-9214-2384  
Website: www.iaslonline.com

The International Association for the Study of the Liver (IASL) is a non-profit organization composed of AASLD, AFASLD, APASL, EASL and LAASL. Its mission is: 1) to promote international education of hepatologists; 2) to facilitate research, and 3) to organize meetings on hepatobiliary disease in conjunction with the Constituent Associations.

International Liver Transplantation Society  
15000 Commerce Parkway  
Suite C  
Mt. Laurel, NJ 08054  
Phone: 856-642-4215  
Fax: 856-439-0525  
Website: www.ilts.org

The ILTS mission is to promote and disseminate multidisciplinary advances in liver transplantation worldwide. ILTS has over 850 members from 60 countries whose primary focus is to advance the practice of liver transplantation through education. Join us in Paris, France July 9 - 12, 2008 for our International Congress on Liver Transplantation. Abstracts are now being accepted. See www.ilts.org for more information.

iQur Ltd  
Mailpoint 811, Level D, South Block  
Southampton General Hospital, Tremona Road  
Southampton, Hants SO16 6YD  
United Kingdom  
Phone: 44-23-8079-8945  
Fax: 44-23-8079-4145  
Website: www.iqur.com

iQur is a biotechnology company specialising in the diagnosis, monitoring and treatment of liver disease. We provide a rapid turnaround, comprehensive diagnostic testing service (quantification, qualification, and genotyping) for hepatitis, HIV, and other diseases affecting the liver. Our menu also includes a patient-friendly repeatable test to measure the extent of liver fibrosis in a number of chronic liver diseases using serum markers (the ELF™ Test).

Lab 21  
184, Cambridge Science Park  
Cambridge, CB4 OGA  
United Kingdom  
Phone: 44-1489-898-600  
Fax: 44-1489-582-327  
Website: www.lab-21.com

Lab21 is a clinical reference laboratory based in Europe offering a full spectrum of molecular diagnostic services for clinical trials and patient management. The company is especially strong in liver disease with a comprehensive portfolio of gold-standard and proprietary assays including drug resistance, fibrosis assessment, and interferon response analysis.

LSU AgCenter  
805 Saint Louis Street  
Baton Rouge, LA 70802  
Phone: 225-389-3055  
Fax: 225-389-7634  
Website: www.lsuagcenter.com

Preventing deadly Vibrio vulnificus infection (from eating raw oysters or exposing wounds to seawater) in patients with liver diseases/disorders is emphasized. Free publications and other educational resources for both physicians and patients are highlighted. The website SafeOysters.org provides additional information and online resources for physicians and patients.
MDS Nordion
447 March Road
Ottawa, ON K2K 1X8
Canada
Phone: 613-592-2790  Fax: 613-592-6815
Website: www.therasphere.com
MDS Nordion is a world-leading supplier of radiation technologies. Its liver cancer treatment TheraSphere®, (Yttrium-90 glass microspheres) is used in radiation treatment or as a bridge to surgery or transplantation. It is an intra-arterial, minimally embolic therapy providing an approved treatment option of portal vein thrombosis patients, improved quality of life and re-treatment potential.

MedPage Today, LLC
150 Clove Road
Little Falls, NJ 07424
Phone: 973-890-0985  Fax: 973-890-1327
Website: www.medpagetoday.com
MedPage Today is "News + CME." We provide clinicians with real time medical news coverage that also offers CME/CE credit. The result is daily engagement with a highly loyal audience. Our news coverage is reviewed and approved by the University of Pennsylvania School of Medicine, which provides CME accreditation.

Nabi Biopharmaceuticals
5800 Park of Commerce Blvd., NW
Boca Raton, FL 33487
Phone: 561-989-5800  Fax: 561-989-5899
Website: www.nabi.com
Our experience and knowledge in powering the immune system drives our continued development of products that address the needs of the liver transplant community. In addition to a rich pipeline of immunologically derived products, we presently have one marketed product, Nabi-HB® [Hepatitis B Immune Globulin (Human)].

Novartis AG
Lichtstrasse 35
Basel, 4056
Switzerland
Phone: 41-61-324-1111
Website: www.novartis.com
Novartis AG is a world leader in developing and offering medicines to patients and physicians worldwide to cure diseases and thus further improve health and overall well being. Aiming to advance the standard of care for chronic liver disease, Novartis is building a portfolio of agents for hepatitis B and C with complementary mechanisms of action, designed to prevent or postpone end stage liver disease and liver transplantation.

Option Care, Inc.
485 Half Day Road
Suite 300
Buffalo Grove, IL 60089
Phone: 888-282-5166
Website: www.optioncare.com
For over 25 years, Option Care, Inc. has made patients' lives easier with a range of healthcare services outside the hospital setting, working with more than 400 payor organizations representing over 75 million Americans. With the largest home infusion and specialty pharmacy footprint in the industry, OptionCare offers treatment nationwide to patients in their homes, physician offices or other alternate sites, including ambulatory treatment centers. Services are provided by highly skilled, clinical professionals from 110+ pharmacy locations.

Orphan Therapeutics, LLC
3 Werner Way
Suite 210
Lebanon, NJ 08833
Phone: 908-849-4805  Fax: 908-849-4806
Website: www.orphantherapeutics.com
Orphan Therapeutics, LLC, specializes in developing and commercializing treatments for rare but serious diseases. We will submit our first NDA for terlipressin in the 2nd half of 2007. Pre-launch activities will focus on hepatorenal syndrome medical education.

Ovation Pharmaceuticals, Inc.
4 Parkway North
Suite 200
Deerfield, IL 60015
Phone: 847-282-1000  Fax: 847-282-1001
Website: www.ovationpharma.com
Ovation Pharmaceuticals, Inc. is a leading biopharmaceutical company that develops, manufactures, and commercializes innovative medicines for severely ill patients with unmet medical needs. Our mission is to provide an uninterrupted supply of potentially lifesaving products and ensure access to these products for your patients.

PharmaCare Specialty Pharmacy
600 Penn Center Blvd.
Pittsburgh, PA 15235
Phone: 800-238-7828  Fax: 412-717-9090
Website: www.pharmacare.com
PharmaCare Specialty Pharmacy is a retail pharmacy that provides reimbursement and clinical services to individuals living with hepatitis and other complex conditions. Choose PharmaCare Specialty and know that your patient will receive the most comprehensive care available for injectable medications. To learn more, call 1-800-238-7828.
PharmXpand LLC  
Booth # 117  
PharmXpand is a healthcare promotion company that markets innovative products such as noninvasive Biomarkers for liver disease diagnosis (fibrosis/cirrhosis): FibroTest, FibroMax to healthcare providers and patients through an exclusive partnership with Biopredictive, a biotech specialized in Hepatology and world leader in liver disease diagnosis. Visit us at www.pharmxpand.com and www.biopredictive.com.

Projects in Knowledge, Inc.  
Booth # 602  
Projects in Knowledge, Inc. is a CME provider that has served the physician community since 1980 by providing cutting-edge, innovative educational activities, specifically in hepatology. Its mission is to improve the quality of healthcare by delivering highest quality CME, with demonstrated results, to physicians throughout the U.S. and worldwide using creative, effective, easily accessible instructional modalities. Projects In Knowledge has been awarded the highest rating achievable by a CME provider.

Quest Diagnostics  
Booth # 705  
Quest Diagnostics is the leading provider of diagnostic testing, information and services that patients and doctors need to make better healthcare decisions. We offer the broadest access to health testing services. Each day, over half a million people rely on us to provide their doctors with medical information to help them assess whether their patients are healthy or ill.

Rare Disease Therapeutics, Inc.  
Booth # 114  
Rare Disease Therapeutics, Inc. is a biopharmaceutical company committed to developing and marketing drugs for rare disorders. RDT’s focus is on inborn errors of metabolism and has two products available: Orfadin® (nitisone), oral treatment for Hereditary Tyrosinemia Type I; and Cystadone® (betaine anhydrous for oral solution), for the treatment of homocystinuria.

Roche  
Booth # 501, 502  
Roche is a worldwide leading innovator of pharmaceuticals and diagnostics. Our people are engaged in the discovery, development, manufacturing, and marketing of prescription medicines in a wide variety of therapeutic areas, including cancer, HIV/AIDS, hepatitis C, transplantation, influenza, and osteoporosis. We invite you to our booth to learn more about Pegasis and CellCept.

Salix Pharmaceuticals, Inc.  
Booth # 604, 606  
Salix Pharmaceuticals, Inc. follows a competitive strategy of in-licensing late-stage pharmaceutical products to treat GI diseases. The Salix portfolio includes COLAZAL®, XIFAXAN®, OsmoPrep™, MOVIPREP®, AZASAN®, ANUSOL-HC®, PROCTOCORT®, PEPCID® Oral Suspension, and DIURIL® Oral Suspension. Exceptional customer service, a dedicated specialty sales force, and quality products underscore Salix’s commitment to the gastroenterology community.

SC Liver Research Consortium  
Booth # 316  
SC Liver Research Consortium is a clinical trial network made up of 90+ hepatologists at 47 sites throughout the United States. In 2005, SCLRC continued its successful HCV CME series, “Hepatitis & Infectious Disease Training Programs,” for clinicians throughout the United States and added a brand new HBV training program.

Schering-Plough  
Booth # 301  
Schering-Plough is a global science-based health care company with leading prescription, consumer, and animal health products. Through internal research and collaborations with partners, Schering-Plough discovers, develops, manufactures, and markets advanced drug therapies to meet important medical needs. Schering-Plough’s vision is to earn the trust of the physicians, patients and customers served by its more than 32,000 people around the world. The company is based in Kenilworth, N.J., and its Website is www.schering-plough.com.
SciClone Pharmaceuticals Booth # 318, 320
901 Mariners Island Blvd.
Suite #205
San Mateo, CA 94404
Phone: 650-358-3456 Fax: 650-358-3469
Website: www.sciclone.com
SciClone Pharmaceuticals is a global biopharmaceutical company developing medicines treating the world’s most serious diseases, including cancer, hepatitis B and hepatitis C. Our lead drug ZADAXIN™ is approved in 34 countries worldwide and is currently in E.U. and U.S. phase 2 & 3 trials for hepatitis C and malignant melanoma.

Sirtex Medical, Inc. Booth # 635
1401 N. Western Avenue
Lake Forest, IL 60045
Phone: 847-482-9023 Fax: 847-482-9103
Website: www.sirtex.com
Sirtex Medical provides SIR-Spheres microspheres for the treatment of unresectable metastatic liver tumors from primary colorectal cancer. SIR-Spheres microspheres are biocompatible resin microspheres loaded with Yttrium 90 that are infused via the hepatic artery using a femoral catheter.

Specialty Scripts Pharmacy Booth # 419
187 Plymouth Avenue
Bldg. 8, 1st Floor
Fall River, MA 02721
Phone: 800-218-5688 Fax: 800-830-5292
Website: www.specialtyscripts.com
SpecialtyScripts Pharmacy, a Cardinal Health Company, is a Massachusetts-based specialty pharmacy that takes a patient-centric approach to specialty pharmacy. The leadership team at SpecialtyScripts™ Pharmacy assists individuals with the clinical, emotional, and practical challenges of taking customized and highly intensive therapies through compassion, knowledge, and advocacy. Our clinical and service excellence is consistently proven through measurable outcomes.

Synovate Healthcare Booth # 716
The Embankment Putney
London SW15 1LB
UK
Phone: 44-208-246-6200 Fax: 44-208-246-6300
Website: www.synovate.com/healthcare
Synovate Healthcare is an independent market research agency specialising 100% in pharmaceuticals and healthcare. Our specialist conference research team is present at the conference to conduct research among delegates. We look forward to speaking to you and listening to your opinions and experiences.

Three Rivers Pharmaceuticals, LLC Booth # 622
301 Commerce Park Drive
Cranberry Township, PA 16066
Phone: 724-778-6100 Fax: 724-778-6101
Website: www.3riverspharma.com
Three Rivers Pharmaceuticals devotes its efforts and resources to developing, manufacturing, and marketing pharmaceutical therapies which are indicated for diseases/medical conditions requiring specialized treatment. Currently, Three Rivers Pharmaceuticals markets prescription drugs in both the U.S. and internationally in the therapeutic categories of antiviral and antifungal agents. Three Rivers Pharmaceuticals has broadened its presence in the hepatitis C market with the December 2005 launch of Ribasphere® Tablets and RibaPak™.

University of Washington Booth # 5
Dept. of Microbiology
Box 358070
Seattle, WA 98195-8070
Phone: 206-732-6134 Fax: 206-732-6056
Website: http://nida.viromics.washington.edu
The NIDA Center for Functional Genomics and HCV-Associated Liver Disease brings a multidisciplinary approach to the study of hepatitis C virus infection and its impact on liver function. Our goal is to provide a comprehensive molecular blueprint of the cellular response to hepatitis C virus infection and a detailed picture of the cellular events characteristic of hepatitis C virus-associated liver disease.

US Bioservices Booth # 200, 201
16750 Westgrove Drive
Suite 100
Addison, TX 75001
Phone: 888-518-7246 Fax: 469-461-0277
Website: www.usbioservices.com
US Bioservices, a Specialty Pharmacy, removes the burden of managing drug compliance by bridging the gap between therapy, nursing, and reimbursement. We guide your patients through treatment — from insurance verification and therapy education to convenient medication delivery and ongoing clinical support. In essence, we work as an extension of your office to help improve your patients’ lives — and your practice’s operations.

Valeant Pharmaceuticals Booth # 524
One Enterprise
Aliso Viejo, CA 92656
Phone: 949-461-6000 Fax: 949-461-6627
Website: www.valeant.com
Valeant Pharmaceuticals International is a global specialty pharmaceutical company that develops, manufactures, and markets a broad range of pharmaceutical products primarily in the areas of neurology, infectious disease, and dermatology. More information about Valeant can be found at www.valeant.com.
Vertex Pharmaceuticals, Inc. Booth # 413
130 Waverly Street
Cambridge, MA 02139
Phone: 617-444-6100 Fax: 617-444-7180
Website: www.vrtx.com

Vertex Pharmaceuticals is a global biotechnology company committed to the discovery and development of small molecule drugs for serious diseases. Telaprevir (VX-950), Vertex’s investigational hepatitis C protease inhibitor, is being evaluated in three Phase 2 clinical trials that have enrolled over 1,000 patients with chronic genotype 1 hepatitis C virus infection.

ViraCor Laboratories Booth # 112
1210 NE Windsor Drive
Lee’s Summit, MO 64086
Phone: 816-347-0113 Fax: 816-347-0143
Website: www.viracor.com

ViraCor Laboratories, the leader in Molecular Diagnostics, provides cutting edge molecular testing. ViraCor qPCR (quantitative) assays are continuously monitored for mutations. The growing list of 24 hr TAT assays includes BK, Adenovirus, HHV-6, and Toxoplasma. Get the updated information on all validated assays from our expanding menu at the booth.

Wako Diagnostics Booth # 608
1600 Bellwood Road
Richmond, VA 23237
Phone: 804-714-1924 Fax: 804-271-0449
Website: www.wakodiagnostics.com

Wako Diagnostics is a comprehensive manufacturer of clinical diagnostic reagents. Wako Diagnostics offers the newly-approved des-γ-carboxy prothrombin (DCP, also called PIVKA-II), plus AFP-L3% and the test system, LiBASys. DCP and AFP-L3% are complementary liver biomarkers for HCC risk. Both tests are FDA cleared for the assessment of risk of developing HCC in patients with chronic liver diseases. Now our FDA-approved, CMS-reimbursed AFP-L3% test is available at major reference laboratories.

Walgreens Specialty Pharmacy Booth # 704
1411 Lake Cook Road
MSL220
Deerfield, IL 60015-5238
Website: www.walgreensspecialtyrx.com

Personalized. Supportive. Reliable. That’s Walgreens Specialty Pharmacy. We are a single-source provider of specialty therapies: oral, injectable, and infused. Our experienced Care Team of pharmacists and nurses provides outstanding patient-focused services: side-effect management, compliance monitoring, insurance coordination, and express delivery or pickup at over 5,000 Walgreens pharmacies nationwide.

Wiley-Blackwell Publishing Booth # 127, 129
350 Main Street
Malden, MA 02148
Phone: 800-759-6102
Website: www.blackwellhepatology.com

Blackwell Publishing merged with John Wiley & Sons, Inc.’s scientific, technical, and medical business in February 2007 to become Wiley-Blackwell, the world’s #1 publisher in hepatology and gastroenterology. We are the official partner of AASLD, publishing HEPATOLOGY and Liver Transplantation. Pick up your journal today and save 15% on all books!

Yasoo Health Booth # 616
2109 W. Market Street
Suite 164
Johnson City, TN 37604
Phone: 423-926-2798 Fax: 423-926-3586
Website: www.yasoo.com

Yasoo Health is a research based company focusing on vitamin malabsorption. Its products include AquAdekSTM, a supplement designed to advance the standard of nutritional care for cystic fibrosis patients and other medical conditions that cause malabsorption, and Aqua-E®, a clinically tested water-soluble form of complete vitamin E.
Open to all meeting registrants

These programs are not affiliated with AASLD.

AASLD provides an opportunity for registrants at The Liver Meeting® to attend independent symposia financially supported by the pharmaceutical industry. These symposia will take place following The Liver Meeting®’s scheduled educational events on Saturday, November 3 after 8 PM, and after 6:30 PM on Sunday, November 4 and Monday, November 5.

Each of the symposia organizers has made a financial contribution in support of the educational mission of AASLD. This support allows symposia organizers access to The Liver Meeting®’s attendees before the meeting by way of mail promotions, and on specific evenings during the meeting following official AASLD functions. They also make many features of The Liver Meeting® possible and help maintain reasonable registration fees. This support is gratefully acknowledged. This acknowledgement, however, does not constitute an endorsement of any product, nor AASLD oversight or endorsement of the content of the program. These programs are not affiliated with AASLD.

Please visit the satellite symposia desk in the Main Lobby for more information and to register for any of the following events.

Saturday, November 3, 2007

Case Debates with the Experts: Applying the Updated Practice Guidelines to the Management of Hepatitis B

Supported by Bristol-Myers Squibb Company
Organized by Clinical Care Options, LLC
CME provided by Postgraduate Institute for Medicine
Constitution A&B, Sheraton Boston Hotel

On completion of this activity, participants should be able to:

- Describe the key factors used in making decisions regarding first-line and rescue therapy in patients with chronic hepatitis B as described by the AASLD Practice Guidelines.
- Review data regarding strategies for preventing and identifying resistance in hepatitis B patients.
- Discuss differences in management strategies for HBeAg-positive and HBeAg-negative patients.
- Summarize data regarding the use of monotherapy vs. combination therapy in hepatitis B treatment.

For more information, contact Amy Goldman at 585-533-1874 or agoldman@clinicaloptions.com.

Decision Points in the Lifelong Management of Chronic Hepatitis B

Supported by F. Hoffmann-La Roche Ltd
Organized by Elements Communications Ltd
CME provided by Centre for Bio-Medical Communications, Inc
Grand & Liberty, Sheraton Boston Hotel

At the conclusion of this program, attendees should be able to understand:

- The natural history of CHB and the different phases (immune tolerant, immune clearance, inactive, and reactivation) as well as the clinical differences between HBeAg-positive and HBeAg-negative hepatitis B.
- How the natural course of infection can lead to spontaneous resolution via the development of HBsAg seroconversion.
- The relevance of the HBsAg as a clinical marker – being the closest outcome to cure of this chronic disease – and other markers which may be used to assess clinical response.
- Which patients need to be treated, the treatment strategies available, and appropriate determinants of treatment success.
- The rationale and modes of action of interferon-based and antiviral therapies and the patterns of response, both on- and off-therapy.
- Why one particular treatment approach may be more appropriate for a given patient scenario.
- The incidence of, and the clinical problems associated with the emergence of resistance to nucleos(t)ide analog therapy.
- The problems associated with cross-resistance between nucleos(t)ide analogs and present treatment options for patients in whom drug-resistant variants have arisen.
- The potential serious consequences of disease progression and the development of hepatocellular carcinoma associated with unresolved CHB infection.
- The management issues around the prevention of serious clinical complications of CHB, also for patients who are co-infected with HCV or HIV.

For more information, contact Wendy Burgess at 44-1959-568-150 or wendyb Burgess@elementscommunications.com.
The Potential Role of Novel Thrombopoietic Growth Factors in Chronic Liver Diseases – Contemporary Considerations of Thrombocytopenia
Supported by GlaxoSmithKline
Organized by Continuing Edge a division of Global Edge, Inc.
CME provided by Educational Review Systems
Republic A&B, Sheraton Boston Hotel
At the conclusion of this program, participants should be able to:
• Identify the major types and respective potential causes of thrombocytopenia in chronic liver disease.
• Describe the incidence, epidemiology, and etiology of thrombocytopenia in HCV infection and other chronic liver diseases.
• Explain the role and clinical consequences of thrombocytopenia in HCV infection and other chronic liver diseases.
• Evaluate recent data investigating the potential to stimulate platelet production in helping to improve treatment for HCV infection.
• Assess current and evolving management strategies specifically for thrombocytopenia in patients with HCV infection and other chronic liver diseases.

For more information, contact Barbara Lovit at 212-792-6628 or blovitt@globaledge-us.com.

Harnessing Scientific Innovations to Improve HCV Outcomes
Supported by Vertex Pharmaceuticals, Inc.
Organized and CME provided by Projects In Knowledge, Inc.
Back Bay A-D, Sheraton Boston Hotel
After participating in this activity, the clinicians should be able to:
• Integrate knowledge of viral kinetics of HCV, molecular interactions with HCV at the cellular level, and mechanisms of action of protease and polymerase inhibitors to determine the potential role of these therapies in HCV patients.
• Utilize knowledge of HCV replication, potential reservoirs of infection, and disease burden to better diagnose patients with HCV and determine strategies for treatment.
• Contrast potential efficacy and safety considerations of protease and polymerase inhibitors, based on preliminary data, as therapeutic options in the future treatment of patients with HCV infection.
• Formulate potential therapeutic strategies involving protease and polymerase inhibitors in combination therapy and their clinical implications based on preliminary data.

For more information, contact Michele Ingram at 973-890-8988 or m.ingram@projectsinknowledge.com.

Sunday, November 4, 2007
Hepatitis B Prevention Following Liver Transplant: A New Era in Viral Prophylaxis
Supported by Apotex Corporation
Organized and CME provided by i3 CME
Republic A&B, Sheraton Boston Hotel
The learning objectives for participants include the ability to:
• Identify factors that affect the rate of HBV recurrence after liver transplantation.
• Give case vignettes, describe the role of hepatitis B immune globulin immunoprophylaxis in the management of HBV post-liver transplantation.
• Assess knowledge of clinical trial evidence supporting the role of nucleos(t)ide analogues in the management of HBV pre- and post-liver transplantation.
• Select new treatment approaches to preempt or prevent HBV reinfection post-transplantation.

For more information, contact Kelly Hanley at 973-579-2268 or kelly.hanley@i3cme.com.

Experts Forecast HCV Treatment Revolution: Live Coverage from the HCV PIPELINE
Supported by Idenix Pharmaceutical Inc/Novartis Pharmaceuticals Corp/Human Genome Sciences, Inc.
Organized and CME provided by AdvancMed, LLC
Constitution A&B, Sheraton Boston Hotel
Upon completion of this activity, participants will be able to:
• Identify markers of treatment success and parameters that contribute to treatment response.
• Differentiate the targets of specifically targeted antiviral therapies (STAT C) that are currently under investigation.
• Analyze the relevance of emerging data of STAT C therapies and the potential utility for the treatment of HCV infection.
• Explore the role of interferon therapy in conjunction with STAT C therapy.
• Outline strategies for the proactive management of treatment resistance.

For more information, contact Rhonda Parrott at 859-543-4117 or rparrott@advancmed.org.
Chronic HBV Infection: Navigating the Road to Successful Patient Outcomes  
**Supported by Novartis Pharmaceuticals**  
**Organized by MDG Development Group, LLC**  
**CME provided by University of Wisconsin School of Medicine and Public Health**  
**Back Bay A-D, Sheraton Boston Hotel**

At the conclusion of this activity, physicians should be able to:

- Discuss the association between HBV DNA levels and 1) patient candidacy for therapy, 2) emergence of treatment resistance, and 3) disease progression, and the implications of this information on HBV treatment strategies.
- Describe how the use of HBV DNA measurement as an early predictor of response to antiviral therapy may lead to improvements in disease management.
- Evaluate new antiviral therapies for CHB in terms of their clinical profiles and role in individualized patient treatment decisions.
- Discuss key clinical considerations with respect to when to initiate, when to stop, when to change, and when to combine antiviral therapy in patients with CHB.
- Describe recommendations for managing challenging patient populations with CHB, including suboptimal responders, women of childbearing age, and persons with HIV/HBV coinfection.

For more information, contact Ellen Donaldson at 908-605-4380 or edonaldson@mktdevgrp.com.

Targeting the Ras/Raf Signaling Pathway: Implications in the Management of Hepatocellular Carcinoma  
**Supported by Onyx Pharmaceuticals/Bayer HealthCare Pharmaceuticals**  
**Organized and CME provided by Educational Concepts Group**  
**Independence East & West, Sheraton Boston Hotel**

Upon completion of this educational activity, participants should be better able to:

- Describe the basic tumor biology and rationale for the development and use of new therapeutic approaches to hepatocellular carcinoma.
- Discuss the clinical implications of the results of pivotal clinical trials, including early phase trials, that have potential to impact the use of novel multikinase-targeting therapies.
- Analyze potential treatment strategies and ongoing clinical trial designs for incorporating new multikinase-targeting therapies in the treatment of hepatocellular carcinoma, including novel combinations.

For more information, contact Tina Stacy at 770-933-1684 or tstacy@educationalconcepts.net.

Medical Crossfire: Chronic Hepatitis C Treatment Challenges in an Era of Advances  
**Supported by Roche Laboratories**  
**Organized by Liberty Communications Network/Medical Crossfire**  
**CME provided by The American Academy of CME, Inc**  
**Grand & Liberty, Sheraton Boston Hotel**

As a result of this activity, participants will be able to:

- Evaluate the clinical significance of response time and the potential influence on treatment decisions.
- Categorize patients that fail to respond to treatment and review treatment options in patients who have failed to respond to prior treatment.
- Describe the issues surrounding liver biopsies and the use of non-invasive tests for fibrosis.
- Examine the potential role of small molecule agents in the treatment of patients with hepatitis C.

For more information, contact Melissa Hefner at 609-918-2087 or hefner@medicalcrossfire.com.

**Monday, November 5, 2007**

**Hepatitis B Makeover: A Case Based Approach for Optimal Patient Care**  
**Supported by Gilead Sciences**  
**Organized and CME provided by Summit Institute of Knowledge, Inc.**  
**Back Bay A-D, Sheraton Boston Hotel**

At the completion of this educational activity, participants should be able to:

- Understand the disease mutations and determine the most appropriate course of therapy.
- Review diagnostic and virological tests which are necessary for staging disease and making treatment decisions.
- Formulate HBV treatment strategies based upon the safety and efficacy of current and emerging therapies to improve patient outcomes.

For more information, contact Jeff Laufer at 732-933-2671 or jlaufer@summit-institute.org.
Current Perspectives on Preventing Recurrence of Hepatitis B in Liver Transplant Recipients
Supported by Nabi Biopharmaceuticals
Organized by The MedEd Group, Inc.
CME provided by Medical Education Resources
Constitution A&B, Sheraton Boston Hotel
At the conclusion of this program, participants will:
• Gain a greater knowledge of the historical perspective regarding liver transplantation and the use of HBIG to prevent recurrence of HBV in liver transplant recipients.
• Gain a greater knowledge of the most recent findings (including outcomes data) from the published literature with regard to the appropriate regimens to prevent recurrence of HBV in liver transplant recipients. This includes current practices in managing the viral replicator versus non-replicator transplant recipient.
• Gain a greater knowledge on current perspectives regarding indefinite versus limited use of HBIG, as well as high-dose versus low-dose HBIG as immunoprophylaxis in the liver transplant recipient.

For more information, contact Cecy Martinez at 561-626-3950 or cmartinez@themededgroup.com.

Emerging Concepts in Diagnosis and Management of Hepatic Encephalopathy: Past, Present and Future
Supported by Salix Pharmaceuticals, Inc
Organized by MDG Development Group, LLC
CME provided by University of Wisconsin School of Medicine and Public Health
Republic A&B, Sheraton Boston Hotel
At the conclusion of this program, participants should be able to:
• Distinguish the differences between minimal and overt hepatic encephalopathy and the importance of early diagnosis.
• Evaluate the various burdens that need to be overcome to adequately distinguish minimal from overt hepatic encephalopathy.
• Discuss issues with current methods for diagnosis and grading of hepatic encephalopathy, and review data on emerging methods that are currently under clinical evaluation.
• Review the clinical experience with currently available and emerging treatment options for hepatic encephalopathy.

For more information, contact Elena Dattolo at 908-605-4375 or edattolo@mktdevgrp.com.
Continuing Medical Education and Disclosures

The American Association for the Study of Liver Diseases (AASLD) is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to provide continuing medical education for physicians.

AASLD designates these educational activities for AMA PRA Category 1 Credits™. Physicians should only claim credit commensurate with the extent of their participation in the activity.

*This activity has been planned and implemented in accordance with the Essential Areas and Policies of the Accreditation Council for Continuing Medical Education through the joint sponsorship of the American Association for the Study of Liver Diseases (AASLD), and the International Liver Transplantation Society (ILTS). AASLD is accredited by the ACCME to provide continuing medical education for physicians.

**Co-sponsored activity: The American Association for the Study of Liver Diseases (AASLD) is accredited by the Accreditation Council for Continuing Medical Education to provide continuing medical education for physicians.

***Amedco, St. Paul, MN, is an approved provider of nursing education by the Wisconsin Nurses Association Continuing Education Approval Program Committee, an accredited approver by the American Nurses Credentialing Center’s Commission on Accreditation.

For nurses, these courses are co-provided by Amedco and AASLD. Maximum contact hours are as follows: Hepatology Associates Course – 4.5 contact hours; Postgraduate Course – 10.0 contact hours; IITS Transplant Course – 6.0 contact hours; NASPGHAN Pediatric Symposium – 2.75 contact hours.

General Learning Objectives and Goals

- Provide a forum for exchange of groundbreaking basic and clinical research in liver diseases.
- Create an arena for the presentation and interchange of opinions on state-of-the-art care and management of the full spectrum of patients with liver diseases.

Disclaimer Notice

Statements, opinions, and results of studies presented at The Liver Meeting® are solely those of the authors and do not reflect the policy or position of AASLD. AASLD does not provide any warranty as to the accuracy or reliability of information presented either verbally or in writing by presenters. No responsibility is assumed by AASLD for any injury and/or damage to persons or property resulting from any use of such information.

Program Planning

As a sponsor accredited by the Accreditation Council for Continuing Medical Education (ACCME), the American Association for the Study of Liver Diseases (AASLD) must ensure balance, independence, objectivity, and scientific rigor in all its sponsored, co-sponsored, and jointly-sponsored activities. All faculty participating in AASLD CME activities are expected to disclose to the program audience relationships with a commercial interest if both (a) the relationship is financial and occurred within the past 12 months and (b) the individual has the opportunity to effect the content of CME about the products or services of that commercial interest. It is the responsibility of the program planners (educational committee members) to ensure that content is valid and aligned with the interest of the public. All conflicts are resolved prior to execution of educational programs.

CME Instructions

Complete the overall Annual Meeting Evaluation and CME Certificate, and do it all online. You may access the online system at the Internet Center in the Hynes Convention Center, as well as from your personal or office computer via the AASLD Web site, www.aasld.org, after the meeting concludes. You may print your CME Certificate or a Certificate of Attendance before leaving The Liver Meeting® or at your leisure when you return home. Please complete the overall evaluation and print out your Certificate by the end of March 2008. Stop by the CME desk in the Registration Area for assistance.
Disclosures

AASLD is committed to ensuring balance, independence, objectivity, and scientific rigor in its sponsored and jointly sponsored educational activities. Individuals in a position to control the content of an AASLD-sponsored activity (program planners, course directors, speakers, etc.) are expected to disclose to the audience all relevant financial relationships during the past 12 months if both (a) the relationship is financial and occurred within the past 12 months and (b) the individual has the opportunity to affect the content of CME about the products or services of that commercial interest.

When an unlabeled use of a commercial product, or an investigational use not yet approved for any purpose is discussed during an educational activity, the speaker shall disclose to the audience that the product is not labeled for the use under discussion or that the product is still investigational.

AASLD will identify and resolve all conflicts of interest prior to program implementation.

Invited speakers, course directors, moderators and program planners have provided the following disclosures:

**Adams, Paul C., MD**
(Postgraduate Course, Meet-the-Professor Luncheon)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Afdhal, Nezam H., MD**
(Photographic Workshop, Schering-Plough, Valeant Pharmaceuticals, Isis Pharmaceuticals, Idenix, Novartis, Idun Pharmaceuticals, Bristol-Myers Squibb, United Therapeutics, Cooley Pharmaceuticals, Prometheus, InterMune, Glaxo Smith Kline, EchoSens, Vertex, Gilead, Salk, Quest
Consultant/Advisor: Ortho Biotech, Valeant Pharmaceuticals, Isis Pharmaceuticals, Idenix, Gilead, EchoSens, Prometheus, Biogen, XTL Pharmaceuticals, Glaxo Smith Kline, EchoSens, Vertex, InterMune, Novartis, Wyeth/ViroPharma, Salk, Schering-Plough, Idera Pharmaceuticals, Stomedia, Sirtris, BioCryst, Arrow Pharmaceuticals, Atlas Pharmaceuticals
Speaker’s Bureau: Schering-Plough, Gilead, Bristol-Myers Squibb, Idenix/Novartis
Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Anania, Frank A., MD**
(Photographic Workshop, General Hepatology Update, Education Committee)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Angulo, Paul, MD**
(Postgraduate Course, Meet-the-Professor Luncheon)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Aranda-Michel, Jaime, MD**
(Photographic Workshop)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Arteel, Gavin E., PhD**
(Photographic Workshop)
Grant/Research Support: NIH/NIAAA
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Bacon, Bruce R., MD**
(Career Development Workshop)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Balistreri, William F., MD**
(Postgraduate Course, Meet-the-Professor Luncheon)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Bansal, Meena, MD**
(Career Development Workshop, Training and Clinical Policy Committee)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Berenguer, Marina, MD**
(Surgery and Liver Transplant Committee)
Nothing to disclose

**Beresford, Thomas P., MD**
(Transplant Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Bezerra, Jorge A., MD**
(Photographic Workshop)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Bini, Edmund, MD**
(Clinical Research Committee)
Grant/Research Support: Schering-Plough, Roche, InterMune, Valeant, SciClone, GlaxoSmithKline, Bristol-Myers Squibb, Wyeth, Idenix
Consultant/Advisor: InScope

**Boyle, Clifford W., MD**
(Pediatric Symposium)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Boyce, Thomas D., MD**
(Postgraduate Course, Advances for Practitioners)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

**Brenner, David A., MD**
(Photographic Workshop)
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)
Brown, Kimberly Ann, MD  
(Surgery and Liver Transplant Committee)  
Speakers’ Bureau: Schering-Plough, Roche, Gilead  
Consultant/Advisor: BlueCross Quality Centers for Transplantation  

Brown, Robert, MD  
(Training and Clinical Policy Committee)  
Grant/Research Support: Schering-Plough, Roche, Vertex  
Consultant/Advisor: Schering-Plough, Vertex  

Brugge, William R., MD  
(Endoscopy Course)  
Grant/Research Support: Pentax  
Consultant/Advisor: Boston Scientific  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Bruix, Jordi, MD  
(Therapeutic Advances in HCC: Sorafenib)  
Grant/Research Support: Schering-Plough, Biocompatibles, Bayer  
Consultant/Advisor: Bayer, Bristol-Myers Squibb  

Brunt, Elizabeth M., MD  
(Postgraduate Course, Meet-the-Professor Luncheon)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Burroughs, Andrew K., FRCP  
(Transplant Course)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Caldwell, Stephen H., MD  
(Early Morning Workshop, Postgraduate Course)  
Grant/Research Support: Nordic Natural  
Speakers’ Bureau: Axcan  
Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Casey, Carol, PhD  
(Basic Research Committee)  
Nothing to disclose  

Chalasani, Naga P., MD  
(Early Morning Workshop, Clinical Research Committee)  
Speakers’ Bureau: Advanced Life Science, Ortho Neil, Metabasis, Abbott, Lilly  
Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Chang, Charissa, MD  
(Career Development Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Chang, Kyong-Mi, MD  
(Basic Research Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Charlton, Michael R., MD  
(Career Development Workshop, Early Morning Workshop, Surgery and Liver Transplant Committee)  
Consultant/Advisor: Roche, NABI, Bristol-Myers Squibb  

Chen, Yang K., MD  
(Endoscopy Course)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Chiang, John, PhD  
(Early Morning Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Chojker, Mario, MD  
(Early Morning Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Chung, Raymond, MD  
(Clinical Research Committee)  
Grant/Research Support: Schering-Plough, Roche  

Clarke-Platt, Janet, RN  
(Education Committee)  
Nothing to disclose  

Clouston, Andrew D., MBBS, PhD  
(Postgraduate Course)  
Disclosure will be provided prior to presentation  

Cohen, David, MD, PhD  
(Basic Research Committee)  
Consultant: Aecerion, Inc.  

Conjevaram, Hari S., MD  
(Early Morning Workshop, Training and Clinical Policy Committee)  
Nothing to disclose  

Corbett, Ruth J., MSN, ARNP  
(Hepatology Associates Course, Education Committee, Hepatology Associates Committee)  
Speakers’ Bureau: Schering-Plough  
Consultant/Advisor: Vertex  

Crispe, T. Nicholas, PhD  
(Early Morning Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Czaja, Mark J., MD  
(Early Morning Workshop)  
Nothing to disclose  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)  

Darling, Jama, MD  
(Basic Research Committee)  
Nothing to disclose  

Dasarathy, Srinivasan, MD  
(Early Morning Workshop)  
Disclosure will be provided prior to presentation  

Davis, Gary, MD  
(Meet-the-Professor Luncheon)  
Grant/Research Support: Schering-Plough, Roche, HGS, Vertex  
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)
Davis, Richard H., Jr, PA-C
(Hepatology Associates Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Day, Christopher P, MD, PhD
(Transplant Course)
Nothing to disclose
Content of presentation does include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

DeLeve, Laurie, MD, PhD
(Governing Board, Postgraduate Course, Meet-the-Professor Luncheon)
Consultant: Johnson and Johnson, Ono Pharma USA, Wyeth-Ayerst
Content of presentation does not include discussion of off-label/investi- gative use of medicine(s), medical devices or procedure(s)

Di Bisceglie, Adrian M., MD
(Early Morning Workshop, Postgraduate Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Diehl, Anna Mae, MD
(Postgraduate Course, Basic Research Committee, Early Morning Workshop)
Grant/Research Support: GlaxoSmithKline, Axcan Pharma
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Dienstag, Jules L., MD
(Early Morning Workshop)
Grant/Research Support: Vertex - Consultant/Advisor: GlaxoSmithKline, Vertex, Bristol-Myers Squibb, Gilead Sciences, Idenix, Achillion, Metabasis, Scicloone, Nucleonics, Valeant, Pharmasset, Genzyme, CombiatorRx
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Dieterich, Douglas, MD
(Meet-the-Professor Luncheon)
Grant/Research Support: Schering-Plough, Roche, Gilead, Bristol-Myers Squibb
Consultant/Advisor: Schering-Plough, Roche, Gilead, Bristol-Myers Squibb
Speakers’ Bureau: Schering-Plough, Roche, Gilead, Bristol-Myers Squibb
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

DiMartini, Andrea, MD
(Transplant Course)
Grant/Research Support: NIAAA, NIDDK
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Doo, Edward, MD
(NIH Corner, Clinical Research Committee)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Durand, Francois, MD
(Transplant Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Durfee, Janet, MSN, ARNP
(Hepatology Associates Course, Hepatology Associates Committee)
Nothing to disclose

El-Serag, Hashem, MD
(Clinical Research Committee)
Grant/Research Support: Schering-Plough
Consultant/Advisor: Roche

Evers, Gregory, MD
(Postgraduate Course, Transplant Course)
Grant/Research Support: Schering-Plough, Roche, Valeant, Vertex, Source, Gilead Johnson, Gilead
Consultant/Advisor: Schering-Plough, Roche, Valeant, Source, Gilead Johnson, Gilead
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Everson, Gregory, MD
(Postgraduate Course, Endoscopy Course, Surgery and Liver Transplant Committee)
Grant/Research Support: Schering-Plough, Roche, Valeant, Vertex, Source, Gilead Johnson, Gilead
Consultant/Advisor: Schering-Plough, Roche, Valeant, Source, Gilead Johnson, Gilead
Content of presentation does include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Faigel, Douglas O., MD
(Endoscopy Course)
Consultant/Advisor: Olympus America, Inc.
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Fallon, Michael B., MD
(Postgraduate Course, Meet-the-Professor Luncheon)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Federle, Michael P., MD
(Postgraduate Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Feldstein, Ariel E., MD
(Early Morning Workshop, Postgraduate Course)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Feng, Sandy, MD, PhD
(Early Morning Workshop, Transplant Course, Scientific Program Committee, Surgery and Liver Transplant Committee)
Grant/Research Support: Genzyme
Consultant/Advisor: Pfizer, Genzyme
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Ferenci, Peter, MD
(Meet-the-Professors Luncheons)
Nothing to disclose
Content of presentation does not include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Flamm, Steve L., MD
(Early Morning Workshop)
Nothing to disclose
Content of presentation does include discussion of off-label/ investigative use of medicine(s), medical devices or procedure(s)

Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Liang, T. Jake, MD  
(Governing Board, Early Morning Workshop, NIH Corner)  
Nothing to disclose

Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Liow, Yun-Fan, MD  
(NIH Corner)  
Grant/Research Support: BMS, Idenix, Novartis, Roche, SciClone, Gilead

Consultant/Advisor: BMS, GSK, Novartis, Roche, Schering-Plough, SciClone

Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Lindor, Keith D., MD  
(Early Morning Workshop)  
Grant/Research Support: Axcen

Consultant/Advisor: BMS, GSK, Novartis, Roche, Schering-Plough, SciClone

Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Liu, Chen, MD  
(Basic Research Committee)  
Nothing to disclose

Llovet, Josep M., MD  
(Early Morning Workshop, Transplant Course, Postgraduate Course)  
Consultant/Advisor: Bayer Pharmaceuticals, Biocompatibles

Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)
Locarnini, Stephen, MD, PhD
[NIH Corner]
Grant/Research Support: Evivar Pty Ltd, Gilead
Consultant/Advisor: Evivar Pty Ltd, Gilead, Pharmasset, BMS
Major Stockholder: Pharmasset
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Lok, Anna SF, MD
[Early Morning Workshop, NIH Corner]
Grant/Research: Bristol-Myers Squibb, Gilead, GlaxoSmithKline, Idenix, Roche, Schering-Plough, Innogenetics, Valeant
Consultant/Advisor: Bristol-Myers Squibb, Gilead, GlaxoSmithKline, Idenix, Roche, Anadys, Innogenetics, Pharmasset
Stockholder: Anadys
Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Lu, Shelly, MD
[Basic Research Committee, Early Morning Workshop]
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Lucy, Michael R., MD
[Early Morning Workshop, Transplant Course]
Grant/Research Support: BMS, Roche, Schering-Plough, SAUX
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Lukin, Karen, MS, ARNP
[Hepatology Associates Course, Hepatology Associates Committee]
Speakers’ Bureau: Roche

Luxon, Bruce A., MD, PhD
[Clinical Research Committee]
Grant/Research Support: Bristol-Myers Squibb, Gilead, GlaxoSmithKline, Idenix, Roche, Schering-Plough, Innogenetics, Valeant
Consultant/Advisor: Bristol-Myers Squibb, Gilead, GlaxoSmithKline, Idenix, Roche, Anadys, Innogenetics, Pharmasset
Stockholder: Anadys
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Ma, Mang M., MD
[Early Morning Workshop]
Grant/Research Support: Vertex, Novartis
Consultant/Advisor: Novartis, Roche
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Macik, Gail, MD
[Postgraduate Course]
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Maher, Jacqueylin J., MD
[Governing Board, Career Development Workshop, Early Morning Workshop, Scientific Program Committee]
Consultant/Advisor: Pfizer
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Majno, Pietro, MD
[Transplant Course]
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Malhi, Harmeet, MD
[Basic Research Committee]
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Manns, Michael, MD
[Meet-the-Professors Luncheon]
Grant/Research Support: Falk Pharma GmbH
Consultant/Advisor: Falk Pharma GmbH

Marrero, Jorge A., MD
[Postgraduate Course]
Nothing to disclose
Content of presentation does not include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

Martin, Paul, MD
[Early Morning Workshop]
Grant/Research Support: Roche, Schering-Plough
Consultant/Advisor: Roche
Speakers’ Bureau: Roche, Schering-Plough
Content of presentation does include discussion of off-label/investigative use of medicine(s), medical devices or procedure(s)

AASLD/ILTS Transplant Course

Friday, November 2
8:00 AM - 3:30 PM  Hynes, Ballroom A/B/C

Therapeutic Challenges in Liver Transplantation: Hepatocellular Carcinoma, Alcoholic Liver Disease and Other Addictive States

COURSE DIRECTORS: Michael R. Lucey, MD
Juan C. Garcia-Valdecasas, MD

6.5 CME Credits
6 Contact Hours

This course draws on experts from within transplant hepatology and other disciplines, such as hepatobiliary surgery, psychiatry, and radiology, to provide a multidisciplinary review of two of the greatest therapeutic challenges involving liver transplant medicine: multidisciplinary management of hepatocellular carcinoma and integrated approaches to addictions, alcoholism, and alcoholic liver disease.

Goals and Objectives:
• Discuss the diagnosis and presentation of hepatocellular carcinoma, addiction, alcoholism, and alcoholic liver disease.
• Explain how management of the conditions under discussion (HCC and ALD) has changed in the era of transplantation.
• Discuss anticipated future multidisciplinary treatment of HCC, alcoholism, and ALD in potential transplant recipients.

8:00 - 8:10 AM  Introduction: The Problem of HCC and Liver Transplantation
Juan C. Garcia-Valdecasas, MD

8:10 - 8:30 AM  Screening and Diagnostic Work-up
Andrew K. Burroughs, FRCP

8:30 - 8:50 AM  Clinical and Molecular Classification of HCC
Josep M. Llovet, MD

8:50 - 9:10 AM  The Need to Biopsy
Francois Durand, MD

9:10 - 9:30 AM  Bridging Interventional Therapy: The Role of the Interventional Radiology
Fred T. Lee, MD

9:30 - 9:50 AM  The Value of Pre-Transplant Treatment: Time For A Controlled Study?
Pietro Majno, MD

9:50 - 10:00 AM  Discussion

10:00 - 10:20 AM  Break

10:20 - 10:40 AM  Allocation in the MELD Era: Is It Justified?
Sandy Feng, MD, PhD

10:40 - 11:00 AM  Results of Liver Transplantation: With and Without Milan Criteria
Vincenzo Mazzaferro, MD

11:00 - 11:20 AM  Molecular Selection of HCC Patients Beyond Milan
Myron Schwartz, MD

11:20 - 11:40 AM  Extending the Indication: The Role of LDLT
Satoru Todo, MD, PhD

11:40 AM - 12:40 PM  Lunch

12:40 - 1:00 PM  What is Addiction, What is Alcoholism?
Thomas P. Beresford, MD

1:00 - 1:20 PM  Treatment of Addictions and Alcoholism
Richard Saitz, MD

1:20 - 1:30 PM  Public and Professional Attitudes to Transplanting Alcoholic Patients
James M. Neuberger, DM

1:30 - 1:50 PM  Treatment of Alcoholic Liver Disease
Christopher P. Day, MD, PhD

1:50 - 2:00 PM  Discussion

2:00 - 2:10 PM  Break

2:10 - 2:30 PM  Natural History of Alcoholism in Liver Transplant Recipients
Andrea DiMartini, MD

2:30 - 2:50 PM  Treatment of Addictive Behavior in Liver Transplant Patients?
Robert M. Weinrieb, MD

Case Presentations

2:50 - 3:05 PM  The Difficult Patient: Alcoholic Hepatitis
Philippe Mathurin, MD, PhD

3:05 - 3:20 PM  The Difficult Patient: HCV and Alcoholic Liver Disease
John R. Lake, MD

3:20 - 3:30 PM  Discussion
AASLD/ASGE Endoscopy Course

Friday, November 2
10:00 AM - 4:00 PM  Hynes, Room 304/306
Endoscopic Management of End Stage Liver Disease: Challenges and Controversies

COURSE DIRECTORS: Yang K. Chen, MD
Lauren B. Gerson, MD

5 CME Credits

Gastrointestinal endoscopy remains a cornerstone of the management of patients with liver disease. This course will highlight the standard of care and review controversies in the management of bleeding, portal hypertension, biliary problems before and after liver transplantation, and biliary stricture diagnosis and management. New techniques such as capsule endoscopy, double balloon enteroscopy, endosonography/doppler, and gastric variceal injection will be described.

Goals and Objectives:
• Describe the role of endoscopy in screening, prophylaxis, and management of active variceal bleeding.
• Describe the indications for ERCP in primary sclerosing cholangitis and in the management of post-liver transplantation biliary complications.
• Demonstrate familiarity with evolving endoscopic technology for diagnosis and management of hepatobiliary diseases.

10:00 - 10:05 AM  Welcome and Introduction
Yang K. Chen, MD

10:05 - 10:20 AM  Sedation for Endoscopy in Patients with End Stage Liver Disease
John Vargo, MD

10:20 - 10:30 AM  Discussion

10:30 - 10:40 AM  Screening and Grading of Esophageal Varices: Is There a Role for Capsule Endoscopy?
Christopher J. Gostout, MD

10:40 - 10:50 AM  Assessment of Hepatic Arterial and Portal Venous Circulation: Is There a Role for EUS/Doppler?
William R. Brugge, MD

10:50 - 11:05 AM  Discussion

11:05 - 11:15 AM  Obscure GI Bleeding in the Cirrhotic Patient: Is There a Role for Capsule Endoscopy or Double Balloon Enteroscopy?
Lauren B. Gerson, MD

11:15 - 11:25 AM  Symptomatic Gallbladder Diseases: Is There a Role for Gallbladder Stenting?
Yang K. Chen, MD

11:25 - 11:40 AM  Discussion

11:40 - 11:55 AM  Endoscopic or Medical Therapy to Prevent First Variceal Hemorrhage? - Medical Therapy
Arun J. Sanyal, MD

11:55 - 12:10 PM  Endoscopic or Medical Therapy to Prevent First Variceal Hemorrhage? - Endoscopic Therapy
Gregory T. Everson, MD

12:10 - 12:25 PM  Discussion

12:25 - 12:40 PM  Endoscopic Treatment of Actively Bleeding Esophageal and Gastric Varices
Dennis Jensen, MD

12:40 - 12:55 PM  Endoscopic Treatment of Nonvariceal Bleeding: GAVE and Portal Hypertensive Gastropathy
Christopher J. Gostout, MD

12:55 - 1:10 PM  Percutaneous or Endoscopic Approach for Stricture Management in Primary Sclerosing Cholangitis? - Percutaneous Approach
Debra A. Gervais, MD

1:25 - 1:40 PM  Percutaneous or Endoscopic Approach for Stricture Management in Primary Sclerosing Cholangitis? - Endoscopic Approach
Raj J. Shah, MD

1:40 - 1:55 PM  Discussion

2:15 - 2:30 PM  Management of Donor and Recipient Biliary Complications after Liver Transplantation
Roshan Shrestha, MD

2:30 - 2:40 PM  Discussion

2:40 - 2:55 PM  EUS for Diagnosis and Surveillance of Liver and Biliary Cancers
Douglas O. Faigel, MD

2:55 - 3:05 PM  Discussion

3:05 - 3:20 PM  Diagnosis and Staging of Cholangiocarcinoma for Liver Transplantation - Role of Molecular Markers
Gregory J. Gores, MD

3:20 - 3:35 PM  Diagnosis and Staging of Cholangiocarcinoma for Liver Transplantation - Role of ERCP and Cholangioscopy
Adam Slivka, MD, PhD

3:35 - 3:50 PM  Discussion

3:50 - 4:00 PM  Closing Remarks
Lauren B. Gerson, MD
AASLD/NASPGHAN Pediatric Symposium

Friday, November 2
12:00 - 3:00 PM  Hynes, Room 302
Fibrocystic Diseases of the Liver

COURSE DIRECTORS: Karen F. Murray, MD
Pramod K. Mistry, MD, PhD

3 CME Credits
2.5 Contact Hours

This symposium will provide a thorough review of fibrocystic diseases affecting the liver. Intended for both hepatologists and gastroenterologists who care for either pediatric or adult patients with hepatic disease, this symposium will review the embryology, genetics, and molecular biology of these conditions. Additionally, the clinical phenotypes, pathology in, clinical complications of, and treatment for these conditions will be reviewed. Expert speakers in the field will provide the latest information in all aspects of these interesting and complicated conditions.

Goals and Objectives:
- Discuss the variety of, and be able to diagnose, fibrocystic diseases involving the liver.
- Summarize the scientific advances that have occurred in our understanding of these conditions.
- Describe the management of patients with fibrocystic diseases involving the liver.

Career Development Workshop

Friday, November 2
12:00 - 4:00 PM  Hynes, Room 210

Career Development Workshop

COURSE DIRECTORS: Arie Regev, MD
Meena B. Bansal, MD

This course is designed to assist trainees pursuing careers in clinical and academic hepatology. The speakers will cover topics such as how to find/choose a mentor, how to make the most out of the mentor-mentee relationship, the interview and contract negotiation process, and funding opportunities for fellows and junior faculty. In addition, participants will be offered the opportunity to network with leaders in the field.

Goals and Objectives:
- Introduce the principles behind starting a clinical research project while in practice.
- Assist trainees and young faculty in gaining a clearer understanding of the grant writing process and options available for funding research projects.
- Understand the dynamics of the mentor/mentee relationship and how to advance academically as a junior faculty member.
- Learn how to negotiate a top quality academic contract.

12:00 - 12:20 PM  The Past, Present, and Future of Hepatology: Where We Have Been, and Where We Are Going
Eugene R. Schiff, MD

12:20 - 12:40 PM  Basic Research for the Junior Investigator
Michael R. Charlton, MD

12:40 - 1:00 PM  How to Start a Clinical Research Project and Write an Effective Grant
Kris V. Kowdley, MD

1:00 - 1:20 PM  NIH Career Development Awards: Which Grant is Right for You?
Judith Podskalny, PhD

1:20 - 1:35 PM  Break

1:35 - 1:55 PM  Effective Mentorship: The Senior Faculty Perspective
Scott L. Friedman, MD

1:55 - 2:15 PM  How to Make the Most of Your Mentor Relationship: The Mentee Point of View
Charissa Chang, MD

2:15 - 2:35 PM  How to Negotiate a Great Academic Contract
Bruce A. Luxon, MD, PhD

2:35 - 2:55 PM  Academic Advancement: Advice for Junior Faculty
Jacquelyn J. Maher, MD

2:55 - 3:15 PM  Fourth Year Advanced Hepatology Fellowship: Who Needs It and Why?
Bruce R. Bacon, MD

3:15 - 3:30 PM  Closing Remarks
Arie Regev, MD

3:30 - 4:00 PM  Breakout Sessions: Ask the Experts

CD-1: NIDDK Career Development Programs
Room 209  Judith Podskalny, PhD

CD-2: Academic Advancement Pearls
Room 205  Jacquelyn J. Maher, MD

CD-3: Basic Research Pearls
Room 204  Michael R. Charlton, MD

CD-4: Fourth Year Fellowship/Certificate of Added Qualification
Room 210  Bruce R. Bacon, MD
Steven K. Herrine, MD
AASLD Postgraduate Course

Friday, November 2
4:00 - 8:00 PM  Hynes, Auditorium

Liver Disease: Pathophysiologic Basis for the Therapy of Liver Disease

COURSE DIRECTORS: Arthur J. McCullough, MD  Ian R. Wanless, MD  Michael B. Fallon, MD  Lisa M. Yerian, MD

11.5 CME Credits
10 Contact Hours

Over the last few years, advances in our understanding of the pathophysiology of liver disease have led to new therapeutic strategies. This two-day Postgraduate course will emphasize our newly gained understanding of the treatment of major liver diseases, with an emphasis on the cellular mechanisms.

The first day of the course will cover iron overload, cholestasis, polycystic liver disease, and hepatic steatosis, and recent developments in the causes and treatment of the above disorders. The second day of the course will focus on changes and challenges in viral hepatitis and vascular disorders of the liver, followed by evidence to surgical issues in portal vein thrombosis, particularly as it pertains to pediatric patients. These topics will be followed by a segment on the latest developments in hepatocellular carcinoma and the challenges that this disease presents to the pathologist, radiologist and clinician. The course will close with a segment on portal hypertension where the audience will be exposed to mechanisms and changes where portal hypertension has a great impact on the course of liver disease.

Throughout the course, important controversies in each specific area will be debated by thought leaders in each field, bringing our specific issues that will cross all specialties including radiology, surgery, hepatology and pathology.

Goals and Objectives:
• Discuss a broad overview of liver disease with an emphasis on histopathology and emerging pathophysiological mechanisms. An emphasis will also be placed on reviewing developments in our genetic understanding of liver disease and the emergence of new therapies, which may include new antivirals and small molecules, as well as new surgical approaches.
• List controversies in the management, diagnosis and care of important liver disorders. These debates will be presented by thought leaders in each field.
• Summarize an authoritative histopathological perspective on the developments in diagnosis and treatment of liver disorders that will be featured in this course. There will be a significant emphasis on pathology review and assessment of the histological basis of liver disease.

### Poster Session 1

**Saturday, November 3, 2007**  
2:00 – 8:00 PM  
Hynes, Exhibit Hall C  
*Refer to page 95A for Poster Presentations*

### Exhibit Hall Opening and Reception

**Saturday, November 3, 2007**  
5:30 – 8:00 PM  
Hynes, Exhibit Hall D
### Postgraduate Course Meet-the-Professor Luncheons

**Saturday, November 3**  
12:00 - 1:30 PM  Refer to your luncheon ticket for meeting room location.

1.5 CME Credits

**Goals and Objectives:**
The goal of the Meet-the-Professor Luncheons is to provide the attendee with an opportunity to explore in more detail a wide variety of topics in hepatology in a small group setting. Topic moderators are experts in their particular specialty area for a given session.

| MTP-01 | What to Do with a High Ferritin | Paul C. Adams, MD and Kris V. Kowdley, MD |
| MTP-02 | What to Do with a Low Ceruloplasmin | Peter Ferenci, MD and Michael L. Schilsky, MD |

Networking Breakfast for Women in Hepatology

Sunday, November 4
6:30 – 7:45 AM  Sheraton, Back Bay B/C

Women working in the field of hepatology research and medicine are invited to participate in this complimentary breakfast meeting to discuss important issues, including attracting more women to GI and liver training, and improving the understanding of liver diseases that predominately affect women.

Early Morning Workshops

Sunday, November 4
6:45 - 7:45 AM  Refer to your luncheon ticket for meeting room location.

1 CME Credit

Early Morning Workshops consist of three categories: Basic Research, Clinical Management and NIH.

Goals and Objectives:

Basic Research Workshops

• Bring together investigators in a specific area of research to discuss their ongoing work.
• Focus of discussions is on new work and not a review of previous studies.
• Allow ample time for questions from the audience.

Clinical Management Workshops

• Discuss difficult management issues utilizing acknowledged experts in the area.
• Provide an overview of the current state-of-the-art in each area.
• Intended for the clinician who is seeking the most up-to-date information on a difficult area of management.
• Allow ample time for questions from the audience.

NIH Workshop

• Evidence for mutation, selection, immune escape, and drug resistance in HCV infection.
• Evidence for reversion when selection pressures are removed.
• The characteristics and relevance of consensus sequences.
• The concept of a latent reservoir, and its potential relevance to HCV antiviral drug resistance.

Basic Research Workshops

EM-01  Experimental Fibrosis
Frank A. Anania, MD and Scott L. Friedman, MD

EM-02  Animal Models of Fatty Liver
Richard M. Green, MD and Jacquelyn J. Maher, MD

Clinical Management Workshops

EM-03  Innate Immunity in Liver Disease
I. Nicholas Crispe, PhD and Dwain L. Thiele, MD

EM-04  Methionine and the S-adenosylmethionine System in Liver Disease
Shelly C. Lu, MD and Craig J. McClain, MD

EM-05  Pathogenesis of Alcoholic Liver Disease
Gavin E. Arteel, PhD and Laura E. Nagy, PhD

EM-06  Microarray Analysis
Jorge Bezerra, MD and Michael R. Charlton, MD

EM-07  Metabolomics
Anna Mae Diehl, MD and Satish C. Kalhan, MBBS, FRCP

NIH Workshop

EM-08  Emerging Therapies for HCV
Michael W. Fried, MD and Andrew Muir, MD

EM-09  Non-traditional Therapies for HCV
Stephen A. Harrison, MD and Nizar N. Zein, MD

EM-10  How to Manage the Post-Transplant Patient
Sandy Feng, MD, PhD and Hugo E. Vargas, MD

EM-11  Expanding the Criteria for Liver Transplantation
Charles M. Miller, MD and James F. Trotter, MD

EM-12  Treatment of PBC and PSC
Cynthia Levy, MD and Keith D. Lindor, MD

EM-13  Nutrition in Chronic Liver Disease in Children
Ross Shepherd, MD, and Ronald J. Sokol, MD

EM-14  Treatment of NASH
Naga P. Chalasani, MD and Hari S. Conjeevaram, MD

NIH Workshop

EM-15  HCV Plasticity: Escape and Resistance
Rajen Koshy, PhD, Stuart C. Ray, MD and Christopher Walker, PhD
NIH/NIDDK REQUEST FOR APPLICATION

Sunday, November 4
6:45 - 7:45 am  Location: TBA
Hepatitis B Clinical Research Network
National Institutes of Health-proposed RFA

Edward Doo, MD and Jay H. Hoofnagle, MD

Staff from NIDDK will present an overview and answer questions about the recently published Request for Applications (RFA) for participation in a multi-year, multi-center North American clinical research network devoted to elucidating the pathogenesis, natural history and optimal means of management of chronic hepatitis B. The RFA will solicit applications for clinical centers, laboratory research cores and a data coordinating center. Open to all interested persons on a walk-in basis. The RFA is available at: http://www2.niddk.nih.gov/Funding/FundingOpportunities/

This meeting is open to all interested investigators, registration is not required.

AASLD Basic Research Workshop

Sunday, November 4
8:00 - 11:40 AM  Hynes, Ballroom B
Regulatory T Cells in Tolerance and Immunity to the Liver

COURSE DIRECTORS:
Kyong-Mi Chang, MD
Ethan M. Shevach, MD

4 CME Credits

Regulatory T cells (Tregs) play a key regulatory role in immune tolerance to self and non-self. With the rapidly increasing knowledge about the nature and role of Tregs in health and disease (e.g. autoimmunity, transplant tolerance, tumor tolerance and pathogen-specific immunity), this workshop will provide the current knowledge about Tregs and their potential role in liver disease pathogenesis and therapeutics.

Goals and Objectives:
• Gain knowledge in the evolving concepts about regulatory T cells and their role in immune regulation in health and disease.
• Learn about the ongoing research on how regulatory T cells may contribute to pathogenesis of liver disease.
• Learn about potential therapeutic application involving regulatory T cells in liver disease.

8:00 - 8:25 AM  Introduction to Tregs
Ethan M. Shevach, MD

Session I. Tregs in Autoimmunity and Transplant Tolerance

8:25 - 8:50 AM  Transplant Tolerance and Regulatory T cells
Wayne Hancock, MD, PhD

8:50 - 9:15 AM  Autoimmune Liver Disease and Tregs
Eric M. Gershwin, MD

9:15 - 9:40 AM  Treg Therapeutic Applications and Manipulations
Carl June, MD

9:40 - 10:00 AM  Break

Session II. Tregs in Pathogen-Specific and Tumor-Specific Immunity

10:00 - 10:25 AM  Tregs in Viral Hepatitis
Kyong-Mi Chang, MD

10:25 - 10:50 AM  IL10+ Tr1 Cells in Viral Hepatitis
Margaret J. Koziel, MD

10:50 - 11:15 AM  Tregs in Liver Cancer
Drew M. Pardoll, MD, PhD

11:15 - 11:40 AM  Panel Discussion and Wrap-up
Hepatology Associates Course

**Sunday, November 4**
8:00 AM - 2:45 PM  Sheraton, Grand Ballroom

**Hepatology Associates Course**

**COURSE DIRECTORS:** Janet Durfee, MSN, APRN  
Karen Luken, MS, APRN

6.5 CME Credits
4.5 Contact Hours

This one-day course will expand the participant’s knowledge base for the treatment of patients with liver disease.

Goals and Objectives:
- Evaluate the case management of typical clinical scenarios in the long-term, post liver transplant patient.
- Compare and contrast the benefits and limitations of the MELD score.
- Describe the association between insulin resistance and liver disease.
- Explain how a hepatology practitioner can have a positive impact on patients with alcohol use disorders.
- Discuss the management of portal hypertension.

State-of-the-Art Lecture

Sunday, November 4
9:35 - 10:05 AM  Hynes, Auditorium

Thomas E. Starzl Transplant Surgery State-of-the-Art Lecture

On the Right Track?: Expanded Criteria in Decreased Donor Liver Transplantation

SPEAKER: Robert Merion, MD
MODERATOR: Douglas W. Hanto, MD, PhD

Dr. Robert M. Merion is Professor of Surgery in the Division of Transplantation at the University of Michigan. He is the Clinical Transplant Director of the Scientific Registry of Transplant Recipients and chairs the Steering Committee of two NIH-funded research consortia, the Adult-to-Adult Living Donor Liver Transplantation Cohort Study (A2ALL) and the Clinical Outcomes of Live Organ Donors network. Dr. Merion is the Secretary of the American Society of Transplant Surgeons, has served on the Board of Directors of the Organ Procurement and Transplantation Network, and is a past president of Gift of Life Michigan. Dr. Merion has published over 200 peer-reviewed articles, books, and book chapters.

This lecture will focus on the increasing use of donated livers from deceased donors with characteristics that are associated with a higher risk of graft failure and death. The development of measures of donor risk, along with information about transplant candidate and recipient mortality risk, allows us to examine the consequences of practice patterns in the choice of donor-recipient combinations.

Goals and Objectives

• Recognize the trends in deceased donor characteristics that have occurred over time.
• Know the donor factors associated with a higher risk of graft failure and death.
• Understand the donor risk index.
• Recognize the association between donor risk factors and recipient transplant survival benefit.
• Be able to make better informed decisions about deceased donor offers for their patients.

The Thomas E. Starzl Transplant Surgery State-of-the-Art Lecture recognizes the pioneering work that Dr. Thomas E. Starzl and colleagues have done to elevate liver transplantation from an experimental procedure to one which saves thousands of lives annually. To ensure that future transplant scientists have a distinct platform to provide their valuable insights at The Liver Meeting®, a restricted fund has been established to support this lecture in perpetuity. AASLD gratefully acknowledges the following individuals and organizations that have generously contributed to this fund:

12:00 - 12:30 PM Hynes, Auditorium

**Hans Popper Basic Science State-of-the-Art Lecture**

**The Mitochondrial Pathway of Apoptosis**

**SPEAKER:** Douglas R. Green, PhD  
**MODERATOR:** Gregory J. Gores, MD

Dr. Douglas Green received his PhD in Biology and Immunology from Yale University in 1981. Following postdoctoral training in experimental surgery and marine biology, he received a faculty position at the University of Alberta in Edmonton in 1985. In 1990 he became the Head of the Division of Cellular Immunology at La Jolla Institute for Allergy and Immunology in San Diego, CA. Since 2005 he has been Chair of Immunology at St. Jude Children’s Research Hospital in Memphis, TN, where he holds the Peter Doherty Chair. Doug Green is an ISI Highly Cited Investigator and has published over 350 research papers, reviews, chapters, and books. His research focuses on the central mechanisms of apoptosis in cancer and the immune system.

The mitochondrial pathway of apoptosis is the major way in which vertebrate cells die during development, homeostasis, and aging, and upon physiological or pathological stress. We will consider the distribution of this pathway for cell death among the animals, which has implications for the evolution of apoptosis. Further, we will review the elements of this pathway and discuss the fundamental ways in which it is regulated. In this pathway, the proteins of the Bcl-2 family are responsible for controlling a critical event, mitochondrial outer membrane permeabilization (MOMP), which is responsible for triggering caspase activation and apoptosis. The interplay of the Bcl-2 family proteins is an essential aspect of MOMP.

Once MOMP has occurred, two things happen that ensure the death of the cell. One of these is caspase activation. The other is less clear, leading to cell death that occurs even if caspase activation is disrupted or blocked. The latter, caspase-independent cell death, may be less efficient than caspase-dependent apoptosis, and considering how cells may survive this form of cell death opens up intriguing new areas of investigation.

The Hans Popper Basic Science State-of-the-Art lecture recognizes Hans Popper, the founder of AASLD, and his role in the establishment of the AASLD journal, *HEPATOLOGY*, and his promotion of the intellectual spirit of the Association.

50 Years of Interferons

**Sunday, November 4**
1:00 - 2:00 PM Hynes, Auditorium

**50 Years of Interferons**

**MODERATORS:** John G. McHutchison, MD  
Eugene R. Schiff, MD

The calendar year 2007 marks the 50th Anniversary for the discovery of Interferons. To date, no other scientific discovery has had such an impact on the care of patients with viral hepatitis. The AASLD will acknowledge and celebrate this anniversary with this 1 hour symposium.

**1:00 - 1:30 PM** Historical Overview on the Discovery of Interferons  
Adrian Reuben, MBBS, FRCP

**1:30 - 2:00 PM** Historical and Ongoing Therapeutic Application of Interferons in Viral Liver Diseases  
Jay H. Hoofnagle, MD
AASLD/NIAID NIH Corner

**Sunday, November 4**

1:00 - 4:00 PM  Hynes, Ballroom B  
Antiviral Therapy Against Hepatitis Viruses: Understanding and Managing Drug Resistance

**COURSE DIRECTORS:**  Anna S. F. Lok, MD  
Rajen Koshy, PhD

This symposium, present in collaboration with the American Association for the Study of Liver Diseases (AASLD) and the U.S. National Institute of Allergy and Infectious Diseases (NIAID), an Institute of the National Institutes of Health (NIH), will address issues important to physicians/health care providers who treat patients with chronic hepatitis, and investigators conducting research on antiviral resistance. A panel of experts (hepatologists, infectious disease specialists, and virologists) will discuss basic and clinical issues including standardization of nomenclature and assays relating to antiviral resistance, detection, and monitoring of antiviral resistance, and management of patients with antiviral-resistant HBV. The panel will also identify research gaps and provide directions for future research.

**Goals and Objectives:**

- Clarify the nomenclature of antiviral-resistant HBV, clinical criteria for diagnosis of antiviral resistance, and assays used to detect antiviral-resistant mutations.
- Discuss the monitoring of HBV infected patients receiving antiviral therapy for antiviral resistance, and the management of patients with antiviral-resistant HBV.
- Discuss these issues in the context of new drugs for the treatment of hepatitis C virus infection.
- Provide an interactive forum for researchers and NIH to discuss future research initiatives and international collaboration.

SHARP Lecture

**Sunday, November 4**

2:00 - 2:30 PM  Hynes, Auditorium  
Therapeutic Advances in Hepatocellular Carcinoma (HCC): Sorafenib

**MODERATOR:**  Gregory J. Gores, MD

2007 is a landmark year for treatment of HCC. The Sorafenib HCC Assessment Randomized Protocol (SHARP) demonstrated a significant survival advantage for patients with HCC. This update will provide an overview of the trial results, and its pragmatic implications for the treatment of HCC.
General Hepatology Update

Sunday, November 4
3:00 - 4:30 PM  Hynes, Auditorium
General Hepatology Update

MODERATORS: Rebecca Wells, MD
Sammy Saab, MD

This symposium will make practitioners who treat patients with liver disease aware of the impact of insulin resistance on the accumulation of hepatic fat and its potential outcome in fatty liver disease and treatment of chronic hepatitis C (HCV) infection. The symposium will also review new nucleoside analogues for chronic hepatitis B (HBV) infection and proper strategies for their use. Finally, issues unique to female patients with liver disease, including pregnancy and menopause, and how gender affects the outcomes of chronic liver disease, will be reviewed to update practitioners on the care of this population.

Goals and Objectives:
• Understand the role of insulin resistance as a systemic disease including the liver.
• Understand the new strategies in treating hepatitis B.
• Understand the unique issues in caring for the female patients with liver disease.

3:00 - 3:30 PM  Insulin Resistance And Liver Disease: More Than Just The Fatty Liver?
Frank A. Anania, MD

3:30 - 4:00 PM  A Rationale Roadmap In Using The Newer Nucleoside Analogues For Chronic Hepatitis B
Emmet B. Keeffe, MD

Early Morning Workshops

Monday, November 5
6:45 - 7:45 AM Refer to your luncheon ticket for meeting room location.

Basic Research Workshops

EM-16 Toll-like Receptors
David A. Brenner, MD and Gyongyi Szabo, MD, PhD

EM-17 Experimental Hepatocarcinogenesis
Josep M. Llovet, MD and Lewis R. Roberts, MD, PhD

EM-18 Pathogenesis of NASH
Arun J. Sanay, MD and Frank A. Anania, MD

EM-19 Oxidative Liver Injury
Mario Chojkier, MD and John J. Lemasters, MD, PhD

EM-20 Stem Cells
Stewart Sell, MD and Neil D. Theise, MD

EM-21 Nuclear Receptors
John Chiang, PhD and Michael Trauner, MD

EM-22 Signaling Mechanisms in the Liver
Michael H. Nathanson, MD, PhD and Rebecca Wells, MD

Clinical Management Workshops

EM-23 Obesity Surgery and the Liver
Vlad Ratziu, MD and Pierre M. Gholam, MD

EM-24 Treatment of Autoimmune Hepatitis
Steven L. Flamm, MD and Jorge L. Rakela, MD

EM-25 Epidemiology of NASH
Stephen H. Caldwell, MD and Zobair M. Younossi, MD

EM-26 Therapeutic Use of Immunosuppressive Drugs
Paul Martin, MD and Russell H. Wiesner, MD

EM-27 Therapy for Alcoholic Hepatitis
Michael R. Lucey, MD and Timothy R. Morgan, MD

EM-28 Acute Liver Failure Due to Drugs
Robert J. Fontana, MD and William M. Lee, MD

EM-29 How to Treat Portal Hypertension
Guadalupe Garcia-Tsao, MD and Vijay Shah, MD

NIH/NIDDK REQUEST FOR APPLICATION

Monday, November 5
6:45 - 7:45 am Location: TBA

Drug-Induced Liver Injury Network (DILIN).
Re-Competition and Expansion, a National Institutes of Health RFA.

Jose Serrano, MD and Leonard B. Seeff, MD

Staff from the NIDDK will present an overview and answer questions about the recently published Request for Applications (RFA) for participation in a multi-year, multi-center clinical research network devoted to establishing a large database with serum, tissue and DNA samples from well characterized cases of drug-induced liver injury. The RFA will solicit applications for clinical centers and a data coordinating center to continue and expand the current “Drug-Induced Liver Injury Network” (DILIN) for another 5 years. Open to all interested persons on a walk-in basis. The text of the RFA is available at: http://www2.niddk.nih.gov/Funding/FundingOpportunities/

This meeting is open to all interested investigators, registration is not required.

Poster Session 3

Monday, November 5, 2007
8:00 AM – 5:30 PM
Hynes, Exhibit Hall C

State-of-the-Art Lecture

Monday, November 5
10:00 - 10:30 AM Hynes, Auditorium

Hyman J. Zimmerman Hepatotoxicity State-of-the-Art Lecture

Endocannabinoids and the Liver: Unlikely Partners in Multiple Functions

SPEAKER: George Kunos, MD, PhD
MODERATOR: Jacquelyn J. Maher, MD

Dr. George Kunos is Scientific Director at the National Institute on Alcohol Abuse and Alcoholism (NIAAA), National Institutes of Health (NIH) in Bethesda, Maryland. His research interests include autonomic pharmacology, receptor mechanisms, cardiovascular regulation, biology of the endocannabinoid system, regulation of energy homeostasis, and the biology of alcoholism. Dr. Kunos has published 160 peer-reviewed papers (including papers in Nature, Nature Medicine Science, Journal of Clinical Investigation, Proceedings of the National Academy of Sciences, Circulation) and 25 book chapters, and edited 4 monographs, and received numerous awards and honors. He is the owner of 3 U.S. patents.

This lecture will begin with a brief historical overview of the discovery of the key components of the endocannabinoid system, its physiological functions and its role in various pathological states. The emerging role of hepatic endocannabinoids and their CB1 receptors in liver biology will then be discussed, including their involvement in non-alcoholic and alcoholic fatty liver, in hepatic fibrogenesis and in the hemodynamic consequences of advanced liver cirrhosis.

Goals and Objectives:
- Understand how endocannabinoids are generated, released, activate receptors and metabolized.
- Understand the key physiological functions of endocannabinoids in the central nervous system and in peripheral tissues.
- Understand the mechanism, underlying both the therapeutic and the undesired side effects of novel medications that interact with components of the endocannabinoid system.

The Hyman J. Zimmerman Hepatotoxicity State-of-the-Art Lecture recognizes Dr. Zimmerman’s work in toxic liver injury. A restricted fund supporting this lecture ensures that future investigators will have a distinct platform to present their valuable work on liver toxicity at The Liver Meeting®. AASLD gratefully acknowledges Eli Lilly and Company for its generous support of this fund.

Break
10:30 – 11:00 am

Advances for Practitioners

Monday, November 5
11:00 AM - 12:30 PM Hynes, Ballroom B

Advances for Practitioners

MODERATOR: Thomas D. Boyer, MD

Advances for Practitioners will focus on recent publications which impact the practice of Hepatology. An emphasis will be placed on therapeutic studies. The lessons learned from the study, the clinical context and its limitations will be discussed. An expert panel will answer the question for each study: Should I incorporate this information into my practice and if so, when?

Goals and Objectives:
- Review recent published manuscripts in clinical hepatology which impact our practice.
- Place the lessons learned from these studies into context.
- Define how this information may immediately impact our clinical practice.

11:00- 11:10 AM Introduction

12:10- 12:30 PM Panel Discussion

**FSG-1: End Points and Study Design in Clinical Trials in Pediatric Hepatology**

**COURSE DIRECTOR:** Benjamin L. Shneider, MD

Special issues exist in the design of clinical trials involving pediatric participants. Currently there are four ongoing, NIH-funded multi-centered drug trials in pediatric hepatology. This session will review the study design in these trials and explore issues in designing future studies in pediatric hepatology.

**Goals and Objectives:**
- Understand special issues relating to the conduct of clinical trials in pediatric hepatology.
- Be aware of current drug trials in pediatric hepatology.
- Critically assess potential drug trial design for children with liver disease.

- **7:00 - 7:10 PM**  
  **Introduction**  
  Benjamin L. Shneider, MD

- **7:10 - 7:35 PM**  
  **Endpoints from the Perspective of the NIH and FDA**  
  Patricia R. Robuck, PhD

- **7:35 - 8:00 PM**  
  **Vitamin E or Metformin for Pediatric NAFLD**  
  Joel E. Lavine, MD, PhD

- **8:00 - 8:25 PM**  
  **Pegylated Interferon +/- Ribavirin for Hepatitis C**  
  Kathleen B. Schwarz, MD

- **8:25 - 8:50 PM**  
  **Perioperative Steroids for Biliary Atresia**  
  Jorge Bezerra, MD

- **9:15 - 10:00 PM**  
  **Discussion**

### FSG-2: Portopulmonary Hypertension in the Era of Liver Transplantation
7:00 - 10:00 AM  Hynes, Room 304/306

**COURSE DIRECTORS:**  
Norman L. Sussman, MD  
Michael J. Krowka, MD

Moderate to severe portopulmonary hypertension (POPH) causes excess mortality in cirrhosis and is considered by many to be a contraindication to liver transplantation. Questions remain about a precise definition, criteria for treatment, and the role of either cadaveric or living-related liver transplantation. This workshop will propose a working definition of POPH, explore the pathophysiology of the condition and update the growing list of agents available for treatment. The benefits and dangers of pharmacotherapy in the context of liver transplantation and a suggested framework for future clinical trials will be discussed.

- **7:00 - 7:05 PM**  
  **Introduction and Welcome**  
  Norman L. Sussman, MD

- **7:05 - 7:30 PM**  
  **POPH: Historical Perspective to Current Knowledge**  
  Michael J. Krowka, MD

- **7:30 - 7:35 PM**  
  **Discussion**

- **7:35 - 7:55 PM**  
  **Pharmacotherapy - Pharmacogenetics: Proposed Mechanisms and Potential Drug Targets - Caveats**  
  Steven M. Kawut, MD

- **7:55 - 8:00 PM**  
  **Discussion**

- **8:00 - 8:20 PM**  
  **POPH Outcome Data to Date - Retrospective - Prospective Correlates**  
  Karen Swanson, DO

- **8:20 - 8:30 PM**  
  **Discussion and Break**

- **8:30 - 8:50 PM**  
  **Pretransplant Management of POPH**  
  Norman L. Sussman, MD

- **8:50 - 9:00 PM**  
  **Discussion**

- **9:00 - 9:20 PM**  
  **POPH Registry - Goals, Current Status, Future Research Directions & Animal Models**  
  Michael B. Fallon, MD

- **9:20 - 9:30 PM**  
  **Discussion**

- **9:30 - 9:55 PM**  
  **Panel Discussion: Issues to Be Addressed in Future Trials**  
  Norman L. Sussman, MD and Michael J. Krowka, MD

- **9:55 - 10:00 PM**  
  **Summary & Closing Remarks**  
  Norman L. Sussman, MD
Early Morning Workshops

**Tuesday, November 6**
6:45 - 7:45 AM  Refer to your luncheon ticket for meeting room location.

**Basic Research Workshops**

- **EM-30** Molecular Virology of Hepatitis C  
  T. Jake Liang, MD and Jean-Michel Pawlotsky, MD, PhD
- **EM-31** Cell Death  
  Mark J. Czaja, MD and Peter R. Galle, MD
- **EM-32** Experimental Therapies for Hepatitis C  
  Stefan Zeuzem, MD and David R. Nelson, MD
- **EM-33** Experimental Therapies for Hepatitis B  
  Jules L. Dienstag, MD and Mang M. Ma, MD
- **EM-34** Regeneration  
  Rebecca A. Taub, MD and Christian Trautwein, MD
- **EM-35** Mechanisms of Trafficking and Motility  
  Allan W. Wolkoff, MD and Hal F. Yee, MD, PhD

**Clinical Management Workshops**

- **EM-36** Viral Hepatitis in Children  
  Regino P. Gonzalez-Peralta, MD and Benjamin L. Schneider, MD
- **EM-37** Non-Invasive Diagnosis of NASH  
  Nezam H. Afzhal, MD and Ariel E. Feldstein, MD
- **EM-38** Emerging Therapies for HBV  
  Ira M. Jacobson, MD and Anna S. F. Lok, MD
- **EM-39** Current and Emerging Therapies of Hepatocellular Cancer  
  Adrian M. Di Bisceglie, MD and Morris Sherman, MD, PhD
- **EM-40** Nutrition in Liver Disease  
  Jaime Aranda-Michel, MD and Srinivasan Dasarathy, MD

**Poster Session 4**

**Tuesday, November 6, 2007**
8:00 AM – 12:30 PM
Hynes, Exhibit Hall C

Refer to page 202A for Poster Presentations
Plenary Sessions

Presidential Plenary III
Tuesday, November 6
8:00 - 9:30 AM  Hynes, Auditorium
MODERATORS:  Arun J. Sanyal, MD
              T. Jake Liang, MD

State-of-the-Art Lecture

Tuesday, November 6
9:30 - 10:00 AM Hynes, Auditorium
Leon Schiff State-of-the-Art Lecture

Primary Biliary Cirrhosis: Current Concepts, Emerging and Rational Therapies

Speaker: Raoul Poupon, MD
Moderator: Nicholas F. LaRusso, MD

Dr. Raoul Poupon is Professor of Hepatology and Gastroenterology at the Pierre et Marie Curie University and Head of the Department of Hepatology and Gastroenterology at Hospital Saint-Antoine in Paris. He is also Director of the National Reference Center dedicated to research and treatment of inflammatory biliary diseases in France and a member of the French National Academy of Medicine. Dr. Poupon received in 2006 the Adolph Windaus Prize for his major contribution in the field of bile acid research. He has been member of the Editorial Board of Hepatology for 15 years. Dr Poupon has written nearly 400 peer-reviewed research papers, review articles, editorials and book chapters in many areas of liver diseases. He has carried out many biological and clinical studies devoted to understanding the role of UDCA in PBC and cholestatic liver diseases. He has identified a syndrome referred to as “Low Phospholipid Associate Cholelithiasis and Cholestasis” and shown its association with defects in the MDR3 gene.

Goals and Objectives:

• To learn recent advances in the pathogenesis of this complex disease and, in particular, understand how genetic as well environmental factors and their stochastic interactions may explain susceptibility to and clinical diversity of PBC.
• To review state-of-art information on the nature and role of the pathobiological processes and mechanisms involved in liver injury in PBC.
• To learn recent advances in the clinical evaluation of PBC and to recognize the early signals of severity.
• To link mechanisms, biological and clinical aspects to current as well as emerging and rationale therapies.

The Leon Schiff State-of-the-Art Lecture honors Dr. Schiff and recognizes the work he did to elevate the study and practice of hepatology to the discipline it is today. The restricted fund supporting this lecture ensures that future hepatologists will have a distinct platform from which to provide their valuable insights at The Liver Meeting®. AASLD gratefully acknowledges the National Genetics Institute for its generous support of this fund.

AASLD BUSINESS MEETING (MEMBERS ONLY)
Tuesday, November 6
10:00 – 11:00 AM Hynes Convention Center Auditorium
Gregory J. Gores, MD, presiding
### Parallel Sessions

#### Advances in the Molecular and Cellular Biology of Bile Formation

**Tuesday, November 6**

**11:15 AM - 12:45 PM**  
**Hynes, Room 309**

**MODERATORS:**  
Michael Trauner, MD  
Shannon Glaser, PhD

ZEBRAFISH EMBRYOS DEVELOP SIGNS OF LIVER DISEASE FOLLOWING SHORT-TERM EXPOSURE TO ALCOHOL

Michael Passeri, Ayca Cinaroglu, Kirsten C. Sadler
Division of Liver Diseases and Molecular Cell and Dev. Biology, Mt. Sinai School of Medicine, New York, NY, USA

PKCε PLAYS A CAUSAL ROLE IN ETHANOL-INDUCED STEATOSIS

J. Phillip Kaiser1, Claudia von Montfort1, Juliane I. Beier1, Luping Guo1, Yuting Zheng2, Aruni Bhatnagar1,2, Gavin E. Arteel1,3
1Pharmacology and Toxicology, University of Louisville, Louisville, KY, USA. 2Division of Cardiology, University of Louisville, Louisville, KY, USA. 3James Graham Brown-Cancer Center, University of Louisville, Louisville, KY, USA

DOSE-DEPENDENT EFFECTS OF ETHANOL ON ADIPOCYTE, HEPATOCYTE AND CARDIAC MYOCYTE FATTY ACID UPTAKE AND TRIGLYCERIDE ACCUMULATION IN C57BL/6J MICE

Shengli Zhou1, Sandy Twaddell2, Elektra Carras1, Jay H. Lefkowitch3, Paul D. Berk1
1Medicine, Columbia University Medical Center, New York, NY, USA. 2Pathology, Columbia University Medical Center, New York, NY, USA

CONTRIBUTION OF THE SYMPATHETIC HORMONE EPINEPHRINE TO THE SENSITIZING EFFECT OF ETHANOL ON LIPOPOLYSACCHARIDE-INDUCED LIVER DAMAGE

Claudia von Montfort1, Juliane I. Beier1, Luping Guo1, Gavin E. Arteel1,2
1Pharmacology & Toxicology, University of Louisville, Louisville, KY, USA. 2James Graham Brown Cancer Center, University of Louisville, Louisville, KY, USA

ENHANCEMENT OF FIBRIN DEPOSITION CONTRIBUTES TO THE SYNERGISTIC EFFECT OF ETHANOL ON LPS-INDUCED LIVER INJURY

Juliane I. Beier1, Luping Guo1, James P. Luyendyk2, Claudia von Montfort1, Gavin E. Arteel1,3
1Pharmacology and Toxicology, University of Louisville Health Science Center, Louisville, KY, USA. 2Pharmacology, Toxicology & Therapeutics, The University of Kansas, Kansas City, KS, USA. 3James Graham Brown Cancer Center, University of Louisville, Louisville, KY, USA

PROSPECTIVE SCREENING OF INFECTION IN PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS TREATED WITH STEROIDS: EARLY RESPONSE TO THERAPY IS THE KEY FACTOR

Alexandre Louvet1,2, Sébastien Dharamy1,2, Jeanne Boitard1, Faustine Wartel1, Valérie Canva1, Pierre Deltenre1, Philippe Mathurin1,2
1Hepatology, Hôpital Huriez, Lille, France. 2INSERM U 795, Lille, France

Denotes AASLD Presidential Poster of Distinction
#202  TOLERANCE AND EFFICACY OF THE MARS SYSTEM IN PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS NON-RESPONSER TO STEROIDS: A PILOT STUDY

Jeanne Boitard, Alexandre Louvet, Benjamin Bismuth, Sébastien Dharancy, Faustine Wattel, Valérie Canva, Pierre Deltenre, Brigitte Jude, François Fourrier, Philippe Mathurin. 1Hepatology, Hôpital Huriez, Lille, France. 2INSERM U 795, Lille, France.

#203  EFFECT OF CHRONIC ALCOHOL CONSUMPTION ON NUCLEAR GENE REGULATORS OF MITOCHONDRIAL FUNCTION

Charles S. Lieber, Maria A. Leo, Xiaolei Wang, Anatoly Ponomarenko, Leonore M. DeCarli. 1Research, James J. Peters VA Medical Center, Bronx, NY, USA. 2Mount Sinai School of Medicine, New York, NY, USA.

#204  ALBUMIN AND OTHER ENDOTOXIN REMOVAL METHODS RESTORE NEUTROPHIL FUNCTION EX VIVO IN PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS

#205  DIAGNOSTIC ACCURACY OF CARBOHYDRATE DEFICIENT TRANSFERRIN IN PATIENTS WITH CHRONIC LIVER DISEASE. ALCOHOL CONSUMPTION AND LIVER DISEASE SEVERITY EFFECTS

Armand Abergel, Corinne Bonny, Karine Randl, Carine Nicolas, Sylvie Massoulier, Bernardette Cruz, Brigitte Chanteranne, Laurence Roszyk, Pierre Jouanel, Gilles Bommelaer, Vincent Sapin. 1Hepato-gastroenterology, CHRU Clermont-Ferrand, Clermont-Ferrand, France. 2Biochemistry, CHRU Clermont-Ferrand, Clermont-Ferrand, France.

#206  PLASMA FROM PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS INDUCES A FUNCTIONAL DEFECT POSSIBLY THROUGH EXPRESSION OF TOLL-LIKE-RECEPTORS 2 AND 9 BUT NOT 4

#207  NUTRITIONAL AND METABOLIC SIMILARITIES BETWEEN ALCOHOLIC AND NON-ALCOHOLIC STEATOHEPATITIS: A GENERAL POPULATION ASSESSMENT

Steven L. Condon, Matthew J. Gurka, Abdullah M. Al-Osaimi, Stephen H. Caldwell, Patrick G. Northrup. 1Gastroenterology and Hepatology, University of Virginia Health System, Charlottesville, VA, USA. 2Public Health Sciences, University of Virginia Health System, Charlottesville, VA, USA.

Biliary Physiology, Transport, Cholangiocyte Biology, Experimental Cholestasis

#208  MEMBRANE TRAFFICKING OF THE HUMAN ORGANIC ANION-TRANSPORTING POLYPEPTIDE C (HOATP-C)

An-Qiang Sun, Vijaya M. Ponomgi, James L. Boyer, Frederick J. Suchy. 1Pediatrics, Box 1664, Mt Sinai Sch Med, New York, NY, USA. 2Yale Liver Center, Yale University School of Medicine, New Haven, CT, USA.

#209  CHEMICAL CHAPERONES PARTIALLY REVERSE THE MISPROCESSING OF A BRIC2 MUTANT OF THE BILE SALT EXPORT PUMP, ABCB11

Ping Lam, Carol J. Soroka, James L. Boyer. Internal Med., Yale University, New Haven, CT, USA.

#210  5’ UNTRANSLATED REGIONS (UTRS) OF HUMAN MULTIDRUG RESISTANCE PROTEIN 2 (MRP2) GENE REGULATE IN VITRO TRANSLATION

Yuan-yuan Zhang, Wei Li, Mary Vore. 1Graduate Center for Toxicology, University of Kentucky, Lexington, KY, USA. 2Hematology Oncology, VA Hospital, Lexington, KY, USA.

#211  FOXA2 REGULATES BILE ACID METABOLISM AND PREVENTS ER STRESS IN THE LIVER

Irina Bochkis, Nir Rubins, Peter White, Klaus Kaestner. Genetics, University of Pennsylvania, Philadelphia, PA, USA.

#212  THE MEMBRANE-BOUND BILE SALT RECEPTOR TGR5 IS EXPRESSED IN NON-PARENCHYMAL CELLS OF RAT LIVER

Verena Keitel, Dieter Häussinger, Ralf Kubitz. Clinic for Gastroenterology, Hepatology and Infectious Diseases, Heinrich-Heine-University, Duesseldorf, Germany.
#213
EXENDIN-4 PROTECTS CHOLANGIOCYTES FROM APOPTOSIS, BOTH IN VITRO AND IN VIVO
Marco Marzioni1, Gianfranco Alpini1, Stefania Saccomanno1, Giammaramo Fava1, Cinzia Candelaresi1, Chiara Rychlicki1, Heather L. Francis2, Luciano Trozzi1, Julie Venter2, Antonio Benedetti1
1Department of Gastroenterology, Università Politecnica delle Marche, Ancona, Italy. 2Division Research & Education,, Scott & White Hospital and The Texas A & M University System Health Science Center College of Medicine, Temple, TX, USA. 3Division of Medicine and Research, Scott & White Hospital and The Texas A & M University System Health Science Center College of Medicine, Temple, TX, USA.

#214
EXPRESSION OF SOLUTE TRANSPORTERS AND WATER CHANNELS IN ARPKD: IMPLICATIONS FOR HEPATIC CYSTOGENESIS
Jesus M. Banales1,2, Pamela S. Tietz1, Seung-Ok Lee1, Bing Q. Huang1, Tatiana V. Masyuk1, Angela J. Stroope1, Sergio A. Gradilone1, Anatoly I. Masyuk1, Juan F. Medina2, Nicholas F. LaRusso1
1Internal Medicine, Mayo Clinic College of Medicine, Rochester, MN, USA. 2Laboratory of Molecular Genetics, University of Navarra School of Medicine, Clinica Universitaria and CIMA, Pamplona, Spain.

#215
NM23-H2 INHIBITS CHOLANGIOCARCINOMA GROWTH BY BINDING TO AND DOWNREGULATING PPARδ
Xuefeng Xia, Wenzheng Zhang, Yuhua Xiao, Dongbing Gao, Gene D. LeSage
Internal Medicine, University of Texas Medical School at Houston, Houston, TX, USA.

#216
SMALL CHOLANGIOCYTES PROLIFERATE IN RESPONSE TO H1 HISTAMINE RECEPTOR STIMULATION VIA ACTIVATION OF THE IP3/CA2+/CAMK/CREB-DEPENDENT PATHWAY
Heather Francis2, Sharon DeMorrow3, Shannon Glaser2, Julie Venter4, Eugenia Gaudio6, Yoshiyuki Ueno7, Paolo Onori6, Antonio Franchitto5, Bradley Vaculin4, Shelley Vaculin2, Giammaramo Fava9, Antonio Benedetti8, Cristina Kelley1, Gianfranco Alpini1
1Department of Medicine and Systems Biology and Translational Medicine, Central Texas Veterans Health Care System, Scott & White and Texas A & M HSC, Temple, TX, USA. 2Research, Central Texas Veterans Health Care System, Temple, TX, USA. 3R&E, Scott & White, Temple, TX, USA. 4Medicine, Texas A&M HSC COM, Temple, TX, USA. 5Medicine and R&E, Scott & White and Texas A & M HSC COM, Temple, TX, USA. 6Gastroenterology, Medicine, Tohoku University School of Medicine, Sendai, Japan. 7Medicine, Texas A&M HSC COM, Temple, TX, USA. 8Gastroenterology, Medicine, Universita' di Ancona, Ancona, Italy. 9Obstetrics and Gynecology, Scott & White and Texas A & M HSC COM, Temple, TX, USA.

#217
PROGESTERONE REGULATES CHOLANGIOCYTE PROLIFERATION DURING CHOLESTASIS BY AUTOCRINE SIGNALING MECHANISMS
Shannon Glaser, Sharon DeMorrow, Heather Francis, Julie Venter, Eugenia Gaudio, Yoshiyuki Ueno, Paolo Onori, Antonio Franchitto, Bradley Vaculin, Shelley Vaculin, Giammaramo Fava, Antonio Benedetti, Cristina Kelley, Gianfranco Alpini
1Department of Medicine and Systems Biology and Translational Medicine, Central Texas Veterans Health Care System, Scott & White and Texas A & M HSC, Temple, TX, USA. 2Research, Central Texas Veterans Health Care System, Temple, TX, USA. 3R&E, Scott & White, Temple, TX, USA. 4Medicine, Texas A&M HSC COM, Temple, TX, USA. 5Medicine and R&E, Scott & White and Texas A & M HSC COM, Temple, TX, USA. 6Gastroenterology, Medicine, Tohoku University School of Medicine, Sendai, Japan. 7Medicine, Texas A&M HSC COM, Temple, TX, USA. 8Gastroenterology, Medicine, Universita’ di Ancona, Ancona, Italy. 9Obstetrics and Gynecology, Scott & White and Texas A & M HSC COM, Temple, TX, USA.

#218
CONTRIBUTION OF COMBINATORIAL LIGAND LIBRARIES TO THE HUMAN BILE PROTEOME: NEW IDENTIFICATIONS AND PROMINENCE OF BINDING PROTEINS
Luc Guerrier1, Stephane Claverol2, Laetitia Finzi3, Frederic Fortis1, Egisto Boschetti1, Chantal Housset3
1Bio-Rad Laboratories, CEA-Saclay, Gif-sur-Yvette, France. 2Pole Proteomique, Plateforme Genomique Fonctionnelle Bordeaux - Pôle Proteomique, Université Bordeaux 2, Bordeaux, France. 3UMR S 680, Inserm, Université Pierre et Marie Curie - Paris 6, Paris, France.

#219
EXTRACELLULAR ATP INDUCES IL-6 TRANSCRIPTION IN BILE DUCT EPITHELIAL CELLS VIA THE P2Y11 RECEPTOR
Jin Yu, Nina Sheung, Jonathan A. Dranoff
Internal Medicine/Digestive Diseases, Yale University School of Medicine, New Haven, CT, USA.

#220
MORPHOLOGICAL AND FUNCTIONAL HETEROGENEITY OF THE MURINE INTRAHEPATIC BILIARY EPITHELIUM
Shannon Glaser, Lisa Pierce, Arundhati Rao, Eugenio Gaudio, Antonio Franchitto, Paolo Onori, Julie Venter, Heather Francis, Bradley Vaculin, Shelley Vaculin, Sharon DeMorrow, Kristina Kelley, Benjamin F. Perry, April Turner, Michael McNeal, Gianfranco Alpini
1Research, Medicine and Systems Biology and Translational Medicine, Central Texas Veterans Health Care System, Scott & White and Texas A & M HSC, Temple, TX, USA. 2Gastroenterology, Medicine, Tohoku University School of Medicine, Sendai, Japan. 3Pathology, Scott & White and Texas A & M HSC COM, Temple, TX, USA. 4Obstetrics and Gynecology, Scott & White and Texas A & M HSC COM, Temple, TX, USA.
#221
**HEDGEHOG SIGNALING AND EPITHELIAL MESENCHYMAL TRANSITIONS DURING BILIARY FIBROSIS**
Alessia Omenetti¹, Alessandro Porrello², Yury Popov³, Liu Yang¹, Youngmi Jung¹, Hendrika M. Vandongen¹, Defile Schuppan³, Anna Mae Diehl¹

LOW-DOSE PEGYLATED INTERFERON THERAPY IN COMBINATION WITH TRANS-ARTERIAL CHEMOINFUSION IN HEPATOCELLULAR CARCINOMA PATIENTS WITH MAJOR PORTAL VEIN THROMBOSIS OR EXTRAHEPATIC METASTASIS

Hyun Deok Shin, Young-Hwa Chung, Dong Dae Seo, Sung Eun Kim, Danbi Lee, Sae Hwan Lee, Yoon-Seon Lee, Myoung Kuk Jang, Soo Hyung Ryu, Kang Mo Kim, Young Suk Lim, Han Chu Lee, Yung Sang Lee, Dong Jin Suh

1Department of Internal Medicine, University of Ulsan College of Medicine, Asan Medical Center, Seoul, South Korea. 2Department of Internal Medicine, Hallym University College of Medicine, Kangdong Sacred Heart Hospital, Seoul, South Korea. 3Department of Internal Medicine, University of Inje College of Medicine, Seoul Paik Hospital, Seoul, South Korea.
#360
HEPATOCYTE DIFFERENTIATION IN CHOLANGIOCARCINOMA, SUGGESTING HEPATIC PROGENITOR CELL ORIGIN

Mina Komuta1, Sara Vander Borght1, Raymond Aerts2, Baki Topal2, Werner Van Steenbergen3, Frederik Nevens3, Tania Roskams1
1Department of Pathology, K.U.Leuven, Leuven, Belgium. 2Department of Abdominal Transplant Surgery, University and University Hospitals of Leuven, Leuven, Belgium. 3Departments and Laboratories of Hepatology, Leuven, Belgium

#361
THE CYCLOOXYGENASE-2 (COX-2)-DERIVED PROSTAGLANDIN E2 (PGE2) ACTIVATES β-CATENIN IN HUMAN CHOLANGIOCARCINOMA CELLS

Kyu Lim, Chang Han, Lihong Xu, Tong Wu
Department of Pathology, University of Pittsburgh, School of Medicine, Pittsburgh, PA, USA

#362
TRENDS IN THE INCIDENCE AND ETIOLOGY OF HEPATOCELLULAR CARCINOMA IN A MANAGED CARE POPULATION: THE ROLES OF VIRAL HEPATITIS AND FATTY LIVER DISEASE

Michele Manos, Rosemary C. Murphy
Viral Hepatitis Registry, Kaiser Permanente Northern California, Oakland, CA, USA

#363
HIV-INFECTED PATIENTS WITH HEPATOCELLULAR CARCINOMA HAVE WORSE SURVIVAL PROGNOSIS THAN UNINFECTED PATIENTS ADJUSTED BY BCLC STAGE

Antonio Díaz-Sanchez1, Ana Matilla1, Oscar Nuñez1, Pilar Miralles2, Jose Antonio Pajares1, Beatriz Merino1, Judith Gomez1, Cecilia Sanz1, Juan Berenguer2, Rafael Bañares1, Gerardo Clemente1
1Liver Unit, Hospital General Universitario Gregorio Marañon, Madrid, Spain. 2Infectious Diseases Department, Hospital General Universitario Gregorio Marañon, Madrid, Spain

#364
ORAL SUPPLEMENTATION WITH BRANCHED-CHAIN AMINO ACIDS IMPROVES SURVIVAL AND RECURRENCE-FREE SURVIVAL AFTER SUCCESSFUL TREATMENT OF HEPATOCELLULAR CARCINOMA IN PATIENTS WITH CIRRHOSIS: A PROSPECTIVE STUDY

Kaoru Tsuchiya, Yasuhiro Asahina, Itsuko Hirayama, Mitsuaki Sato, Tomohiro Tanaka, Nobutoshi Komatsu, Naoki Umeda, Takanori Hosokawa, Ken Ueda, Hiroyuki Hatanaka, Jun Itakura, Masahiko Kurosaki, Masakatsu Uchihara, Shozo Miyake, Namiki Izumi, Gastroenterology and Hepatology, Musashino Red Cross Hospital, Tokyo, Japan

#365
SEPARATE ANALYSIS OF INTRANODULAR BLOOD SUPPLY IN NODULAR LESIONS ASSOCIATED WITH LIVER CIRRHOSIS: A NOVEL ULTRASOUND TECHNIQUE “PURE ARTERIAL PHASE IMAGING”

Masatoshi Kudo, Kinuyo Hatanaka, Yasunori Minami, Hiroshi Tei, Kiyoshi Maekawa
Kinki University School of Medicine, Osaka, Japan

#366
GENOME-WIDE MOLECULAR PROFILES OF HCV-INDUCED HEPATOCELLULAR CARCINOMA

Gisèle Nkontchou1, Tin tin Myint Htar1, Vladimir Lazar2, Hugues Ripoche2, John Ripoche2, Philippe Dessen2, Jean Claude Trinchet1, Michel Beaugrand1
1Liver Unit, Bondy, France. 2Fonctionnell Genomics, Institut Gustave Roussy, Bondy, France

#367
THE MELD BASED OBJECTIVE SCORING SYSTEM (MOSS): NEW INSIGHT INTO RISK STRATIFICATION OF CIRRHOTIC PATIENTS WITH HEPATOCELLULAR CARCINOMA

Swee H. Teh1, Susan L. Orloff1, Brett C. Sheppard1, Jonathan M. Schwartz2, John Kaufman3, Steve Cha1, Raymond Kim4, Patrick S. Kamath5, David Nagorney5
1Surgery, Oregon Health & Science University, Portland, OR, USA. 2Gastroenterology and Hepatology, Oregon Health and Science University, Portland, OR, USA. 3Interventional Radiology, Oregon Health and Science University, Portland, OR, USA. 4Gastroenterology and Hepatology, Mayo Clinic, Rochester, MN, USA. 5Surgery, Mayo Clinic, Rochester, MN, USA

#368
SEMIANNUAL SURVEILLANCE FOR HEPATOCELLULAR CARCINOMA IMPROVED PATIENT SURVIVAL COMPARED TO ANNUAL SURVEILLANCE (KOREAN EXPERIENCE)

Do Young Kim1,2, Kwang Hyub Han1,3, Sang Hoon Ahn1,3, Yong Han Paik1,2, Kwan Sik Lee1,2, Chae Yoon Chon1,2, Young Myoung Moon4
1Internal Medicine, Yonsei University College of Medicine, Seoul, South Korea. 2Institute of Gastroenterology, Seoul, South Korea. 3Liver Cirrhosis Clinical Research Center, Seoul, South Korea. 4Internal Medicine, Kwandong University College of Medicine, Goyang, South Korea

#369
PROSPECTIVE EVALUATION OF STAGING SYSTEMS FOR HEPATOCELLULAR CARCINOMA DETECTED DURING SURVEILLANCE OF CIRRHOTIC PATIENTS

Angelo Sangiovanni1, Mauro Viganò1, Massimo Iavarone1, Alessio Aghemo1, Bruno Cesana2, Gian Maria Prati1, Matteo A. Manini1, Raffaella Romeo1, Massimo Colombo1
1A.M. & A. Migliavacca, First Division of Gastroenterology, Fondazione IRCCS Maggiore Hospital Policlinico, Milano, Italy. 2Unit of Medical Statistics and Biometry, University of Brescia, Milan, Italy.
#370
HEPATOCELLULAR CARCINOMAS (HCC) IN PATIENTS WITH METABOLIC SYNDROME: A ROLE FOR MALIGNANT TRANSFORMATION OF TELANGIECTATIC ADENOMA?
Valerie Paradis1, Stephane Zalinski2, Francoise Degos3, Pierre Bedossa1, Jacques Belghiti2
1Pathology, Beaujon hospital, Clichy, France. 2Hepato-biliary surgery, Beaujon hospital, Clichy, France. 3Hepatology, Beaujon hospital, Clichy, France

#371
PROGNOSTIC FACTORS IN PATIENTS WITH HEPATOCELLULAR CARCINOMA AND MACROVASCULAR INVASION
Patricia Lopez1, Saswan Roayaie1, Pablo Uva1, Pruthvi Patel1, Jonathan Schwartz2, Theresa Shao1, Ana del Pozo1, Myron Schwartz1, Josep M. Llovet1
1Mount Sinai Liver Cancer Program, New York, NY, USA. 2ImClone, Branchburg, NJ, USA

#372
TELOMERE AND MITOTIC INSTABILITY AS MARKERS FOR THE PROGRESSION OF HEPATOCELLULAR CARCINOMA AND POSSIBLE IMPLICATIONS IN STEM CELL CARCINOGENESIS
Bong-Kyeong Oh1, Haeryoung Kim2, Young Nyun Park3, Jeong Eun Yoo4, Kyung Sik Kim5, Chanil Park6
1Cancer Metastasis Research Center, Yonsei University College of Medicine, Seoul, South Korea. 2Department of Pathology, Seoul National University Bundang Hospital, Seongnam, South Korea. 3Department of Pathology, Center for Chronic Metabolic Disease Research, Institute of Gastroenterology and Brain Korea 21 Project for Medical Science, Yonsei University College of Medicine, Seoul, South Korea. 4Department of Pathology, Center for Chronic Metabolic Disease Research and Brain Korea 21 Project for Medical Science, Yonsei University College of Medicine, Seoul, South Korea. 5Department of General Surgery, Yonsei University College of Medicine, Seoul, South Korea. 6Department of Pathology and Brain Korea 21 Project for Medical Science, Yonsei University College of Medicine, Seoul, South Korea

#373
PREDICTIVE ABILITY OF HEPATOCELLULAR CARCINOMA STAGING SYSTEMS ACCORDING TO THE TREATMENT MODALITY IN A COHORT OF PATIENTS PROSPECTIVELY FOLLOWED AT A SINGLE REFERRAL CENTRE
Massimo De Giorgio1,2, Stefano Vezzoli2, Riccardo Bezzo2, Maria Grazia Luca1, Giovanni Verga1, Stefano Okolicsanyi4, Maria Grazia Valsecchi2, Stefania Galimberti3, Michele Colledan1, Stefano Fagioli1, Mario Strazzabosco2,4
1Ospedali Riuniti di Bergamo, Bergamo, Italy. 2CeLiveR, Ospedali Riuniti di Bergamo, Bergamo, Italy. 3University of Milano-Bicocca, Milan, Italy. 4Internal Medicine-Digestive Diseases Liver Center, Yale University, New Haven, CT, USA

#374
THE EFFECT OF SUSTAINED HBV VIREMIA ON THE RECURRENCE OF HEPATOCELLULAR CARCINOMA AFTER CURATIVE RESECTION
Beom Kyung Kim1, Sang Hoon Ahn1,2, Ja Kyung Kim1,2, Do Young Kim1,2, Yong Han Paik1,2, Kwan Sik Lee1,2, Byung Soo Moon1, Chae Yoon Chan1,2, Young Myung Moon4, Kwang Hyub Han1,2
1Internal medicine, Yonsei University College of Medicine, Seoul, South Korea. 2Liver Cancer Special Clinic, Yonsei University College of Medicine, Seoul, South Korea. 3Liver Cirrhosis Clinical research center, Yonsei University College of Medicine, Seoul, South Korea. 4Internal medicine, Kwandong University College of Medicine, koyang, South Korea

#375
SERUM EXPRESSION OF LECTIN REACTIVE ALPHA-FETOPROTEIN, DES-GAMMA-CARBOXY PROTHROMBIN, GOLGI PROTEIN-73 ANTIGEN AND ANTIBODY, FOR THE DIAGNOSIS OF HEPATOCELLULAR CARCINOMA
Angelo Sangiovanni, Raffaella Romeo, Gian Maria Prati, Matteo A. Manini, Massimo lavarone, Guido Ronchi, Massimo Colombo First Division of Gastroenterology, Fondazione IRCCS Maggiore Hospital Policlinic, Mangiagalli & Regina Elena, Milan, Italy

#376
EARLY DIAGNOSIS PANEL OF SERUM BIOMARKERS OF HBV-INDUCED HEPATOCELLULAR CARCINOMA DURING 3 YEARS FOLLOW-UP
Canghai Wang, Bao en Wang, Hong You, Xiaojuan Ou Beijing Friendship Hospital, Beijing, China

#377
GRADING OF MICROSCOPIC VASCULAR INVASION FOR RESECTED HEPATOCELLULAR CARCINOMA
Sasan Roayaie, Josep M. Llovet, Iris Blume, Mostafa Gaabour, Swam N. Thung, Myron Schwartz Mount Sinai Liver Cancer Program, Mount Sinai Medical Center, New York, NY, USA

#378
SURVEILLANCE CT SCANS FOR RECURRENCE OF HEPATOCELLULAR CARCINOMA POST-LIVER TRANSPLANT
David Hudesman, Marialisabel Fiel, Sasan Roayaie, Paul Martin, Myron Schwartz Mount Sinai School of Medicine, New York, NY, USA
116A POSTER SESSIONS HEPATOLOGY, October 2007

#379
COMPREHENSIVE GENOME ANALYSIS FOR ETIOLOGY-DEPENDENT AND ETIOLOGY-INDEPENDENT MOLECULAR MECHANISMS IN HUMAN HEPATOCARCINOGENESIS

Thomas Longerich1, Christof Schlaeger2, Claudia Schiller1, Peter Bewerunge3, Arianne Mehrabi4, Roland Eils3, Peter Lichter2, Peter Schirmacher1, Bernhard Radlwimmer2
1Institute of Pathology, University of Heidelberg, Heidelberg, Germany. 2Division of Molecular Genetics, German Cancer Research Centre, Heidelberg, Germany. 3Division of Theoretical Bioinformatics, German Cancer Research Centre, Heidelberg, Germany. 4Department of General, Visceral and Transplantation Surgery, University of Heidelberg, Heidelberg, Germany

#380
TUMOUR M2-PYRUVATE KINASE HAS A DIAGNOSTIC AND PROGNOSTIC ROLE IN BILIARY TRACT CANCER

James H. Brindley1, Dipok K. Dhar1, Michael Chapman1, James S. Dooley2, Stephen P. Pereira1
1The Institute of Hepatology, Royal Free & University College London Medical School, London, United Kingdom. 2Centre for Hepatology, Royal Free & University College London Medical School, London, United Kingdom

#381
BETA-BLOCKERS TREATMENT IS ASSOCIATED WITH A LOWER INCIDENCE OF HCC IN PATIENTS WITH VIRAL C CIRRHOSIS AND OESOPHAGEAL VARICES

Gisèle Nkontchou1, Amel Mahmoudi1, Jeanne Reboul Marty2, Valérie Bourcier1, Nathalie Ganne Carrie1, Véronique Grando Lemaire1, Jean Claude Trinchet1, Michel Beaugrand1
1Liver Unit, Bondy, France. 2Public Heath, Bondy, France

#382
CLINICAL SIGNIFICANCE OF SERUM ALPHA-FETOPROTEIN (AFP) AND DES-GAMMA-CARBOXY PROTHROMBIN (DCP) LEVELS IN PATIENTS WITH HEPATOCELLULAR CARCINOMA (HCC) UNDERGOING HEPATECTOMY

Kentaroh Yamamoto, Hiroshi Imamura, Michiro Takahashi, Kiyoshi Hasegawa, Yoshiyuki Beck, Yashikiko Sugawara, Masatoshi Makuuchi, Norihiro Kakudo
Hepato-Biliary-Pancreatic Surgery, Tokyo University Hospital, Tokyo, Japan

#383
SORAFENIB IN MULTIFOCAL HEPATOCELLULAR CARCINOMA AND ADVANCED LIVER DYSFUNCTION

Matthias W. Pinter1, Wolfgang Sieghart1, Ivo Graziaide2, Robert Königsberg3, Markus Peck-Radosavljevic3
1Gastroenterology & Hepatology, AKH & Medizinische Universität Wien, Vienna, Austria. 2Gastroenterology & Hepatology, KKH & Medizinische Universität Innsbruck, Innsbruck, Austria. 3Oncology & Hematology, SMZ-Süd - Kaiser-Franz-Josef-Spital, Vienna, Austria

#384
GLOBAL DNA METHYLATION INDEX (GDMI) PROFILE IN PATIENTS WITH CIRRHOSIS: CORRELATION TO UNDERLYING CAUSE OF DISEASE AND ASSOCIATED HEPATOCELLULAR CARCINOMA

Michel Mendler1, Anthony Anisowicz2, Eric Huang3, Rick Selby3, Richard Del Mastro4, Linda Sher3
1GI and Liver Diseases, Transplantation Institute, Loma Linda University Medical Center, Loma Linda, CA, USA. 2Cardiovascular Disease Area, Novartis Institute for Biomedical Research, Cambridge, MA, USA. 3Liver Transplant Program and Center for Liver Disease, University of Southern California, Los Angeles, CA, USA. 4GIBCO Cell Culture Systems, Invitrogen Corporation, Grand Island, NY, USA

#385
COST-EFFECTIVENESS OF NEW SCREENING STRATEGIES FOR HEPATOCELLULAR CARCINOMA (HCC) COMPARED TO ULTRASOUND (US)

Mark W. Russo1, Richard K. Sterling2
1Medicine, Carolinas Medical Center, Charlotte, NC, USA. 2Medicine, Medical College of Virginia, Richmond, VA, USA

#386
10-YEAR ACTUAL LONG-TERM OUTCOME OF HCC AFTER SURGICAL RESECTION: SINGLE CENTER EXPERIENCES

Woo Young Shin1, Kyung-Suk Suh1, Hae Won Lee1, Eung-Ho Cho1, Nam-Joon Yi1, Jung-Hwan Yoon2, Kuhn Uk Lee1
1Surgery, Seoul National University College of Medicine, Seoul, South Korea. 2Internal medicine, Seoul National University College of Medicine, Seoul, South Korea

#387
LOW SERUM APOLIPOPROTEIN A1 IS PREDICTIVE OF HCC DEVELOPMENT IN PATIENTS WITH VIRAL C CIRRHOSIS

Gisèle Nkontchou1, Jenny Vaysse2, Amel Mahmoudi1, Valérie Bourcier1, Nathalie Ganne Carrie1, Véronique Grando Lemaire1, Jean Claude Trinchet1, Eric Vicaut3, Michel Beaugrand1
1Liver Unit, Bondy, France. 2Biochemistry, Jean Verdier Hospital, Bondy, France. 3URC Saint Louis, Paris, France

#388
A COMPREHENSIVE PROSPECTIVE STUDY FOR THE VALUE OF 11C-ACETATE AND 18F-FDG PET-CT IN THE DETECTION OF HEPATOCELLULAR CARCINOMA

Ji Hoon Kim1, Joong-Won Park1, Seok Ki Lee2, Seok Ki Kim2, Seong Il Cho2, Sung Jae Park1, Jin-Koo Lee1, Eun Kyung Hong1, Chang-Min Kim1
1Center for Liver Cancer, National Cancer Center, Goyang, South Korea. 2Department of Nuclear Medicine, National Cancer Center, Goyang, South Korea
#389
MICRORNA EXPRESSION PROFILING COMBINED WITH ANALYSIS OF TARGET GENE EXPRESSION IN CHRONIC VIRAL HEPATITIS AND HEPATOCELLULAR CARCINOMA
Shunsuke Ura, Masao Honda, Teruyuki Ueda, Ryuhei Nishino, Hajime Takatori, Mikiko Nakamura, Shuichi Kaneko
Gastroenterology, Graduate School of Medical Science, Kanazawa University, Kanazawa, Japan

#390
IDENTIFICATION OF AN INCREASED ZONATED EXPRESSION OF β-CATENIN TARGETED GENES IN FOCAL NODULAR HYPERPLASIA BUT NOT IN FNH-LIKE NODULES
Sandra Rebourissou1, Gabrielle Couchy1, Sandrine Imbeaud2, Louis Libbrecht3, Charles P. Balabaud4, Tania Roskams3, Paulette Bioulac-Sage5, Jessica Zucman-Rossi1
1U674, Inserm, Paris, France. 2CNRS, Villejuif, France. 3Department and Laboratories of Pathology, University Hospitals of Leuven, Leuven, Belgium. 4Hôpital Saint André, CHU Bordeaux, Bordeaux, France. 5Hôpital Pellegrin, CHU Bordeaux, Bordeaux, France

#391
EXPRESSION OF GALECTIN-3 IS IMPLICATED IN THE PROGNOSIS OF HEPATOCELLULAR CARCINOMA
Yasunori Matsuda, Yoko Yamagiwa, Yoshiyuki Ueno, Tooru Shimosegawa
Division of Gastroenterology, Tohoku University Graduate School of Medicine, Sendai, Japan

#392
LIVER RADIOEMBOLIZATION EFFECTIVELY CONTROLS TUMOR GROWTH OF MACROSCOPIC BUT NOT MICROSCOPIC DISEASE IN PATIENTS WITH HEPATOCELLULAR CARCINOMA
Mercedes Ferrairaegui1, Felix Alegre1, Jose Ignacio Biblao2, Antonio Martinez de la Cuesta2, Alberto Benito2, Javier Arbizu2, J Ignacio Herrera1, Jorge Quiroga1, Jesus Prieto1, Bruno Sangro1
1Liver Unit, Clinica Universitaria de Navarra, Pamplona, Spain. 2Radiology, Clinica Universitaria de Navarra, Pamplona, Spain. 3Nuclear Medicine, Clinica Universitaria de Navarra, Pamplona, Spain

#393
THE SIGNIFICANCE OF OSTEOPONTIN PROMOTER SNPS AT NT-155 AND FOXD3 AS HOST FACTORS TO REGULATE THE DEVELOPMENT OF HEPATOCELLULAR CARCINOMA IN FEMALE PATIENTS WITH HCV INFECTION
Kazuhiro Hamaoka1, Sumiko Nagoshi1, Kayoko Sugawara1, Mie Inao1, Kayoko Naiki1, Masayuki Naito1, Nobuaki Nakayama1, Kenji Fujiwara2, Satoshi Mochida1
1Division of Gastroenterology and Hepatology, Saitama Medical University, Moroyama-Machi, Japan. 2Yokohama Rosai Hospital for Labor Welfare Corporation, Yokohama, Japan

#394
PROGNOSIS OF PATIENTS WITH CHOLANGIOCARCINOMA IN AN AMERICAN COHORT
Reena Salgia, Amit Singal, Shawn Pelletier, Robert J. Fontana, Anna S. Lok, Jorge A. Marrero
Department of Internal Medicine, Ann Arbor, MI, USA

#395
INTERNAL RADIOTHERAPY WITH 90YTRIUM GLASS MICROSHEPHERES (THERASPHERE) FOR LOCALLY ADVANCED HEPATOCELLULAR CARCINOMA: PROSPECTIVE VALIDATION OF SAFETY AND EFFICACY IN A EUROPEAN PILOT STUDY
Judith Ertle1, Gerald Antoch2, Monia Hamami3, Andreas Bockisch3, Guido Gerken1, Philip Hilgard1
1Dept. of Gastroenterology and Hepatology, University-Hospital Essen, Essen, Germany. 2Institute for Diagnostic and Interventional Radiology, University-Hospital Essen, Essen, Germany. 3Institute for Nuclear Medicine, University-Hospital Essen, Essen, Germany

#396
PROSPECTIVE EVALUATION OF ABBREVIATED P16 METHYLATION IN SERUM OF PATIENTS BEFORE AND AFTER THERAPY FOR LOCALIZED HCC
Francesca Ferrara1,2, Francesca Lodato1, Pasquale Chieco2, Vilma Mantovani2, Antonio Colecchia1, Enrico Roda1, Stefano Brilli1
1Dept. of Internal Medicine & Gastroenterology, University of Bologna, Bologna, Italy. 2CRBA, Azienda Ospedaliero-Universitaria, Bologna, Italy

#397
POLYMORPHISMS OF DNA REPAIR GENES XRCC3, ERCC5/XPG AND RISK OF HEPATOCELLULAR CARCINOMA IN KOREAN WITH CHRONIC HEPATITIS B INFECTION
Neung Hwa Park1, Bo Ryung Park1, Jung Woo Shin1, Seok Won Jung1, Chang Woo Nam2, Yang Won Na2, Jae Hee Seo3, Hyun Duk Shin4, Se Hwan Lee4, Danbi Lee4, Sung Eun Kim4, Jung A Kim4, Young-Hwa Chung4
1Internal Medicine, Ulsan University Hospital, Ulsan, South Korea. 2Surgery, Ulsan University Hospital, University of Ulsan College of Medicine, Ulsan, South Korea. 3Pathology, Ulsan University Hospital, University of Ulsan College of Medicine, Ulsan, South Korea. 4Internal Medicine, Asan Medical Center, University of Ulsan College of Medicine, Seoul, South Korea

#398
INTRAHEPATIC DISTANT RECURRENCE AFTER RADIOFREQUENCY ABLATION FOR SINGLE SMALL HEPATOCELLULAR CARCINOMA: RISK FACTORS AND PATTERNS
Yusuke Okuwaki1, Takahide Nakazawa1, Koji Ono1, Hisashi Hidaka1, Akitaka Shibuya1, Shigehiro Kokubu2, Katsunori Saigenji1
1Gastroenterology, Kitasato University East Hospital, Sagamihara, Japan. 2Gastroenterology, Juntendo University Nerima Hospital, Nerima, Japan
#399
**RISK FACTORS FOR TUMOR RECURRENT DIFFER AMONG PATIENTS WITH HEPATOCellular CARCINOMA OF VARIED ETIOLOGY**
Hepatology, Toranomon Hospital, Tokyo, Japan

#400
**HEPATITIS B VIRUS X GENE MUTATIONS ARE COMMON IN PATIENTS BOTH WITH OR WITHOUT HEPATOCellular CARCINOMA AND FURTHER MUTATIONS OCCUR WHEN HEPATOCellular CARCINOMA DEVELOPS**
Chee-Kiat Tan1, Pik-Eu Jason Chang1, Gek-Keow Lim1, Peng-Jin London Lucien Ooi2, Yaw-Fui Alexander Chung3, Kah-Hoe Pierce Chow3, Wan-Cheng Chow1
1Dept of Gastroenterology and Hepatology, Singapore General Hospital, Singapore, Singapore. 2Dept of Surgical Oncology, National Cancer Centre, Singapore, Singapore. 3Dept of General Surgery, Singapore General Hospital, Singapore, Singapore

#401
**TRENDS IN THE INCIDENCE OF HEPATOCellular CARCINOMA IN SINGAPORE 1968-2002**
Mark L. Fernandes1, Yiong Huak Chan2, Seng Gee Lim1
1Gastroenterology and hepatology, National University Hospital, Singapore, Singapore. 2Biostatistics Unit, Faculty of Medicine, National University of Singapore, Singapore, Singapore

#402
**THE CHANGING EPIDEMIOLOGY AND ETIOLOGY OF HEPATOCellular CARCINOMA FROM 1969 THROUGH 2006 IN ALASKA NATIVE PEOPLE**
Marc Connelly1, Michael Bruce2, Nicholas Kassebaum2, Lisa Bulkow2, Mary Snowball3, Brian J. McMahon2,3
1Department of Surgery, Alaska Native Medical Center, Anchorage, AK, USA. 2Arctic Investigations Program, Centers for Disease Control and Prevention, Anchorage, AK, USA. 3Liver Disease and Hepatitis Program, Alaska Native Tribal Health Consortium, Anchorage, AK, USA

#403
**PROGNOSTIC FACTORS AFFECTING 3 YEARS SURVIVAL IN PATIENTS WITH HEPATOCellular CARCINOMA (HCC)**
Massimo De Giorgio1,2, Stefano Vezzoli2, Riccardo Bezzo2, Maria Grazia Luca1, Giovanni Verga1, Stefano Okolicsanyi3, Maria Grazia Valserchi2, Stefania Galimberti2, Michele Colledan1, Stefano Fagioli1, Maria Strazzabosco2,4
1Ospedali Riuniti di Bergamo, Bergamo, Italy. 2Ospedali Riuniti di Bergamo, Bergamo, Italy. 3Universita’ di Milano-Bicocca, Milano, Italy. 4Internal Medicine-Digestive Diseases, Yale University, New Haven, CT, USA

#404
**THE CLINICOPATHOLOGICAL AND PROGNOSTIC SIGNIFICANCE OF ALPHA-FETOPROTEIN EXPRESSION IN INTRAHEPATIC CHOLANGIOCARCINOMA. A POSSIBLE PROGENITOR CELL ORIGIN**
Junpei Soeda, Takenari Nakata, Shiro Miwa, Shinichi Miyagawa
1st. Department of Surgery, Shinshu University, Matsumoto, Japan

#405
**THE INTERACTIVE EFFECT OF PROGNOSTIC FACTORS AND PI-88 USE ON THE DELAY OF HEPATOCellular CARCINOMA (HCC) RECURRENT FOLLOWING CURATIVE PARTIAL HEPATIC RESECTION**
James Garner, Justus Homburg
Progen Pharmaceuticals Limited, Brisbane, QLD, Australia

#406
**COPY NUMBER ANALYSIS OF HEPATOCellular CARCINOMA USING TEN GENES DERIVED FROM GENECIP DATA SET OF HEPATOMA CELL LINES**
Yasuo Tanaka1,2, Fumihiko Kanai1,2, Motohisa Tada1,4, Ryosuke Tateishi1, Shuichiro Shinya1, Haruhiko Kobashi1, Takao Kawabe1, Osamu Yokosuka4, Seishi Ogawa3, Masao Omata1
1Department of Gastroenterology, University of Tokyo, Tokyo, Japan. 2Department of Clinical Drug Evaluation, University of Tokyo Hospital, Tokyo, Japan. 3Department of Regeneration Medicine for Hematopoiesis, University of Tokyo, Tokyo, Japan. 4Department of Medicine and Clinical Oncology, Chiba University, Chiba, Japan

#407
**PRETRANSPLANT CHEMOEMBOLIZATION FOR HEPATOCellular CARCINOMA ≤ 3 CM DOES NOT INFLUENCE THE OUTCOME AFTER LIVER TRANSPLANTATION**
Mohamed Amer, Mohammed Youssi, Fatma Barakat, Yehia Naga, Fatma Barakat, Yoko Kono, Lisa M. Richards, Elliot Alpert, Claude B. Sirlin, Rose Steven, Marquis Hart, Aijal Khanna, Tarek Hassanein
University of California, San Diego, San Diego, CA, USA

#408
**BILIARY INSULIN LIKE GROWTH FACTOR-1 (IGF1) IS A SENSITIVE MARKER FOR THE DIAGNOSIS OF EXTRAEHEPATIC CHOLANGIOCARCINOMA**
Domenico Alvaro1, Gianpiero Macarri2, Maria Grazia Mancino1, Marco Marzioni2, Maria Consiglia Bragazzi1, Paolo Onori3, Stefano Ginanni-Corradini1, Pietro Invernizzi4, Antonio Franchitto1, Eugenio Gaudio1, Antonio Benedetti2
1Clinical Medicine, University of Rome “La Sapienza”, Rome, Italy. 2Dept. of Gastroenterology, Polytechnic University of Ancona, Ancona, Italy. 3Dept. of Experimental Medicine, State University of L’Aquila, L’Aquila, Italy. 4Division of Internal Medicine, University of Milan, Milan, Italy

#409
**RADIOFREQUENCY ABLATION FOR HEPATOCellular CARCINOMA AND INTRATUMORAL PRESSURE**
Chiaki Kawamoto, Atsushi Yamauchi, Yoko Baba, Koji Yakobi
Department of Gastroenterology and Hepatology, Saitama Medical Center, Saitama Medical University, Kawagoe-shi, Japan
#410
TREATMENT OF RECURRENT HEPATOCELLULAR CARCINOMA AFTER CURATIVE RADIOFREQUENCY ABLATION

Ryosuke Tateishi1, Shuichiro Shiina1, Takamasa Ohki1, Takahisa Sato1, Ryota Masuzaki1, Jun Imamura2, Noriyoshi Yamashiki1, Tadashi Goto1, Hideo Yoshida1, Shuntaro Obi1, Haruhiko Kobashi1, Masao Omata1
1Department of Gastroenterology, University of Tokyo, Tokyo, Japan. 2Department of Hepatology, Kyoundo Hospital, Tokyo, Japan

#411
POLYMORPHISM OF INTERLEUKIN-18 IS A RISK FACTOR FOR THE CLEARANCE OF HEPATITIS B VIRUS INFECTION AND HEPATOCELLULAR CARCINOMA DEVELOPMENT

Jaeyoun Cheong1,2, Sungwon Cho1,2
1Gastroenterology, Ajou University School of Medicine, Suwon, South Korea. 2Ajou Genome Research Center, Suwon, South Korea

#412
LONG TERM RESULTS OF RFA VS SURGICAL RESECTION FOR HCC IN PATIENTS WITH WELL PRESERVED LIVER FUNCTION

Chang-Min Cho, Hyun-Cheol Lee, Min-Kyu Jung, Seong-Woo Jeon, Won-Young Tak, Young-Oh Kweon
Internal Medicine, Kyungpook National University Hospital, Daegu, South Korea

#413
A PROPOSAL OF NOVEL TREATMENT-ASSIST TECHNIQUE IN THE SONAZOID-ENHANCED ULTRASONOGRAPHY: VALUE OF DEFECT RE-PERFUSION IMAGING

Masatoshi Kudo, Kinuyo Hatanaka, Yasunori Minami, Hiroshi Tei, Kiyoshi Maekawa
Dept. Gastroenterology and Hepatology, Kinki University School of Medicine, Osaka, Japan

#414
DISCOVER A NEW BIOMARKER FOR EARLY DETECTION OF HEPATOCELLULAR CARCINOMA USING MALDI-TOF MS AND CLINPROTOOLS

Yang Liu1, Masahiko Sunaga2,3, Kazuyuki Sagawa2,3, Mamoru Sato2,3, Hiroshi Unemura2, Masaharu Yoshikawa1, Osamu Yosokua2, Takeshi Tonomaga2, Fumio Nomura2
1Department of Medicine and Clinical Oncology, Graduate School of Medicine Chiba University, Chiba, Japan. 2Department of Molecular Diagnosis, Graduate School of Medicine Chiba University, Chiba, Japan. 3Clinical Proteomics, Chiba University Hospital, Chiba, Japan

#415
GENETIC POLYMORPHISMS ASSOCIATED WITH CLEARANCE OF HEPATITIS B VIRUS INFECTION AND HEPATOCELLULAR CARCINOMA OCCURRENCE DETECTED BY SNP CHIPS

Jaeyoun Cheong1, KyuBum Kwack2, SeungKu Lee2, Jason J Kang3, Sungwon Cho1
1Gastroenterology, Ajou University School of Medicine, Suwon, South Korea. 2Pochon CHA University, Seongnam, South Korea. 3Macrogen, Seoul, South Korea

#416
LIVER TRANSPLANTATION IN PATIENTS WITH HEPATOCELLULAR CARCINOMA ACROSS MILAN CRITERIA

J Ignacio Herrera1, Mercedes Inarrairaegui1, Bruno Sangro1, Fernando Pardo2, Jorge Quiroga1, Felix Alegre1, Fernando Rotellari2, Custodia Montel2, Jesus Prieto1
1Department of Medicine, Liver Unit, Universidad de Navarra, School of Medicine, Pamplona, Spain. 2Department of Surgery, Clinica Universitaria, Pamplona, Spain

#417
REGULATION OF THE NKG2D IMMUNORECEPTOR BY SOLUBLE MICA DURING TRANSCATHETER ARTERIAL EMBOLIZATION FOR HEPATOCELLULAR CARCINOMA

Keisuke Kohga1, Tetsuo Takehara1, Hayata Hikita1, Akira Sasakawa1, Akio Uemura1, Ryotaro Sakamori1, Shinjiro Yamaguchi1, Tomohide Tatsumi1, Kazuyoshi Okawa1, Tatsuya Kanto1, Naoki Hiramatsu1, Kazuhiro Katayama2, Michio Katoh1, Norio Hayashi1
1Department of Gastroenterology and Hepatology, Osaka University Graduate School of Medicine, Suita, Japan. 2Department of Gastroenterology and Hepatology, Osaka Koseinenkin Hospital, Osaka, Japan. 3Department of Gastroenterology and Hepatology, Osaka National Hospital, Osaka, Japan

#418
HIGHER EXPRESSION OF MICROSOMAL PROSTAGLANDIN E SYNTHASE-1 IN NON-TUMOROUS LIVER TISSUES ASSOCIATES WITH SHORTER RECURRENCE-FREE SURVIVAL OF PATIENTS WITH HEPATOCELLULAR CARCINOMA

Hikaru Fujioka, Koichi Nonaka, Atsumasa Komori, Seigo Abiru, Shinya Onizuka, Kiyoshi Migita, Masahiro Ito, Hiroshi Yatsuhashi, Hiromi Ishibashi
Clinical Research Center, NHO Nagasaki Medical Center, Omura, Nagasaki, Japan

#419
MASS FORMING TYPE OF INTRAHEPATIC CHOLANGIOCELLULAR CARCINOMA: FAVOURING FACTORS AND HISTOLOGICAL CHANGES IN THE NON TUMOROUS LIVER

Gisèle Nkontchou1, Jeanne Tran Van Nhieu2, Adriana Andraluka4, Valérie Bourcier1, Nathalie Ganne Carrie1, Véronique Grando Lemaire1, Jean Claude Trinchet1, Marianne Ziol4, Daniel Cherqui3, Michel Beaumard1
1Liver Unit, Bondy, France. 2Pathology Unit, Centre Hospitalier de Créteil, Creteil, France. 3Surgery Unit, Centre Hospitalier de Créteil, Creteil, France. 4Pathology Unit, Jean Verdier Hospital, Bondy, France
#420
SERUM ANTIBODY TO HEPATITIS B CORE ANTIGEN IS NOT ASSOCIATED WITH INCREASED RISK OF HEPATOCELLULAR CARCINOMA IN PATIENTS WITH HCV-RELATED CIRRHOSIS
Tommaso Stroffolini1, Piero L. Almasio2, Marcello Persico3, GiovanBattista Gaeta4, Savino Bruno5
1Department of Gastroenterology, AO San Giacomo, Rome, Italy. 2Gastroenterology and Hepatology Unit, Palermo, Italy. 3Department of Internal Medicine, Naples, Italy. 4Viral Hepatitis Unit, Naples, Italy. 5Department of Medicine, AO Fatebenefratelli e Oftalmico, Milan, Italy

#421
LEFT LOBE LOCATION OF HEPATOCELLULAR CARCINOMA AS A RISK FACTOR OF COMPLICATIONS OF RADIOFREQUENCY ABLATION
Olivier Seror1, Gisèle Nkontchou2, Medhat Ibraheem1, Corinne Barrucand1, Nathalie Ganne Carrie6, Emanuelle Coderc1, Jean Claude Trinchet2, Michel Beaugrand2, Nicolas Sellier1
1Radiology Unit, Jean Verdier Hospital, Bondy, France. 2Liver Unit, Jean Verdier Hospital, Bondy, France

#422
EFFECT OF INTRAPERITONEAL SALINE INFUSION FOR PERCUTANEOUS RADIOFREQUENCY ABLATION OF HEPATOCELLULAR CARCINOMA
Yun-Jin Chung, Won-Young Tak, Young-Dae Park, Se-Young Lee, Seok-Jin Yoon, Soo-Young Park, Eun-Soo Kim, Min-Kyu Jung, Seong-Woo Jeon, Chang-Min Cho, Young-Oh Kweon, Sung-Kook Kim, Yong-Hwan Choi
Hepatology, Kyungpook National University Hospital, Daegu, South Korea

#423
TRANSARTERIAL CHEMOEMBOLISATION USING DRUG ELUTING BEADS FOR HEPATOCELLULAR CARCINOMA - RESPONSE AND SIDE EFFECT PROFILE
Brionhy W. Smith1, Jonathon Tibballs2, John Ferguson2, Bastiaan DeBoer2, Gary P. Jeffrey1,4, Leon Adams1,4, Luc Delriviere6, Andrew Mitchell3, Gerry C. MacQuillan1,4
1Western Australian Liver Transplantation Service, Sir Charles Gairdner Hospital, Perth, WA, Australia. 2Department of Radiology, Sir Charles Gairdner Hospital, Perth, WA, Australia. 3Department of Anatomical Pathology, Pathwest, Perth, WA, Australia. 4Department of Medicine and Pharmacology, University of Western Australia, Perth, WA, Australia. 5Western Australian Liver and Kidney Transplant Surgery, Sir Charles Gairdner Hospital, Perth, WA, Australia.

#424
THERAPEUTIC OUTCOMES OF RADIOFREQUENCY ABLATION UNDER GENERAL ANESTHESIA FOR HEPATOCELLULAR CARCINOMA - PROPENSITY ANALYSIS OF RFA VERSUS SURGERY
Akiko Saito1, Michiyo Chiba1, Tomoko Komiya1, Yuki Yoneda1, Keiko Shiratori1, Shinichi Arizumi1, Satoshi Katagiri1, Hideo Katuragawa1, Masakazu Yamamoto1, Ken Takasaki1, Toshio Morizane2
1Institute of Gastroenterology, Tokyo Women’s Medical University, Tokyo, Japan. 2Department of Medicine, Kanagawa Dental College, Kanagawa, Japan

#425
ELEVATED SERUM HYALURONIC ACID MAY IDENTIFY VINYL CHLORIDE WORKERS AT HIGH RISK FOR THE SUBSEQUENT DEVELOPMENT OF HEPATIC ANGIOSARCOMA
Matthew C. Cave1, Royce Groce1, Arpna Mahalingashetty1, Swati Joshi-Barve1, Lark Reynolds1, Craig J. McClain1,2
1Medicine/Gastroenterology, University of Louisville, Louisville, KY, USA. 2Louisville VAMC, Louisville, KY, USA

#426
COMPARISON OF FIBROSCAN, APRI, AST/ALT AND CLINICAL SIGNS AS NON INVASIVE PREDICTORS OF CIRRHOSIS
Raza Malik, Rory Farnan, Michelle Lai, Hannalisa Freitag, Detlef Schuppan, Nezam H. Afzal
Beth Israel Deaconess Medical Center, Boston, MA, USA

#427
PROSPECTIVE STUDY OF NEOPLASTIC SEEDING IN PATIENTS UNDERGOING ULTRASOUND GUIDED PERCUTANEOUS DIAGNOSTIC OR THERAPEUTIC PROCEDURES OF HEPATIC TUMORS
Gian Ludovico Rapaccini, Laura Riccardi, Manuela Nestola, Fulvia Elia, Nicoletta de Matthaes, Antonio Grieco, Giovanni Gasbarri, Maurizio Pompili
Internal Medicine, Catholic University, Rome, Italy

#428
CORRELATION OF LAPAROSCOPIC LIVER BIOPSY TO ELASTICITY MEASUREMENTS (FIBROSCAN®) IN PATIENTS WITH CHRONIC LIVER DISEASE
Carmine G. Nudo1, Lennox Jeffers1, Pablo A. Bejarano2, Luis A. Servin-Abad1, Zvi Leibovici1, Maria de Medina1, Eugene R. Schiff1
1Division of Hepatology, Center for Liver Diseases, University of Miami, Leonard M. Miller School of Medicine, Miami, FL, USA. 2Department of Pathology, University of Miami, Leonard M. Miller School of Medicine, Miami, FL, USA

#429
COMPUTATIONAL FLOW DYNAMICS SIMULATION OF PORTAL BRANCHES IS USEFUL FOR ANALYZING THE MECHANISM OF NON-UNIFORM REGIONAL LIVER REGENERATION AFTER SURGICAL RESECTION
Surgery, Hyogo College of Medicine, Nishinomiya, Japan
#430
HEPATOCELLULAR ADENOMAS: MR IMAGING FEATURES ACCORDING TO THE GENOTYPE/PHENOTYPE CLASSIFICATION

Herve Laumonier4, Paulette Bioulac-Sage3,5, Christophe Laurent1, Antonio Sa Cunha1, Jean Saric1, Sandra Rebuissou2, Jessica Zucman-Rossi5, Charles P. Balabaud1,5, Hervé Trillaud4
1Hepatology, Hôpital St André CHU Bordeaux, Bordeaux, France. 2U 674, Inserm, Paris, France. 3Pathology, Hôpital Pellegrin CHU Bordeaux, Bordeaux, France. 4Radiology, Hôpital St André CHU Bordeaux, Bordeaux, France. 5GREF U 889, Inserm Université Bordeaux2, Bordeaux, France.

#431
HIGH HFN1α MUTATION FREQUENCY IN LIVER ADENOMATOSIS

Hervé Laumonier2, Jean Frédéric Blanc1,4, Christophe Laurent1, Karine Poussin5, Anne Rollier3,4, Brigitte Le Bail3,4, Antonio Sa Cunha1, Jean Saric1, Hervé Trillaud2, Charles P. Balabaud1,4, Jessica Zucman-Rossi5, Paulette Bioulac-Sage3,4
1Hepatology, Hôpital St André CHU Bordeaux, Bordeaux, France. 2radiology, Hôpital St André CHU Bordeaux, Bordeaux, France. 3Pathology, Hôpital Pellegrin CHU Bordeaux, Bordeaux, France. 4GREF, Inserm Université Bordeaux2, Bordeaux, France.

#432
DIAGNOSTIC VALUE OF GLUTAMINE SYNTHASE TO DIFFERENTIATE FOCAL NODULAR HYPERPLASIA (FNH) FROM HEPATOCELLULAR ADENOMA (HCA) AND CARCINOMA

Paulette Bioulac-Sage2,4, Sandra Rebuissou5, Herve Laumonier1, Gabrielle Couchy5, Anne Rollier2,4, Christophe Laurent1, Antonio Sa Cunha1, Jean Saric1, Charles P. Balabaud1,4, Jessica Zucman-Rossi5, Hervé Trillaud2
1Hepatology, Hôpital St André, Bordeaux, France. 2Pathology, Hôpital Pellegrin CHU Bordeaux, Bordeaux, France. 3Radiology, Hôpital St André CHU Bordeaux, Bordeaux, France. 4GREF, Inserm U 889 Université Bordeaux 2, Bordeaux, France. 5U674, Inserm, Paris, France.

#433
IMPACT OF PREOPERATIVE VIRTUAL SEGMENTAL VOLUMETRY ON LIVER RESECTION FOR HEPATOCELLULAR CARCINOMA IN PATIENTS WITH IMPAIRED LIVER FUNCTION

Junichi Yamanaka, Shinichi Saito, Yuji limuro, Tadamichi Hirano, Nobukazu Kuroda, Toshihiro Okada, Takaaki Sugimoto, Yasukane Asano, Naoki Uyama, Jiro Fujimoto
First Department of Surgery, Hyogo College of Medicine, Nishinomiya, Japan

#434
ASSESSMENT OF HEPATIC FUNCTIONAL RESERVE USING FUNCTIONAL LIVER MR IMAGING: CORRELATION WITH LABORATORY AND PATHOLOGIC FINDINGS IN ANIMAL MODEL

Jin-Woo Lee1, Soon Gu Cho2, Jong Il Lee3, Seok Jeong1, Kye Sook Kwon1, Don Haeng Lee1, Hyung Gil Kim1, Yong Woon Shin1, Young Soo Kim1, Eun Joo Kim1, Hyun-Joo Park1, In-Seo Park1
1Department of Gastroenterology and Hepatology, Inha University College of Medicine, Incheon, South Korea. 2Department of Radiology, Inha University College of Medicine, Incheon, South Korea. 3Department of Pathology, Inha University College of Medicine, Incheon, South Korea.

#435
ULTRASONOGRAPHIC ANALYSIS OF HAVMS IN A LARGE COHORT OF HEREDITARY HEMORRHAGIC TELANGIECTASIA PATIENTS: DEFINITION OF A NEW HIGHLY-ACCURATE INTRAHEPATIC PARAMETER

Patrizia Suppressa1, Paolo Buonamico1, Giovanna Pasculli1, Gennaro M. Lenato1, Franco D’Ovidio2, Maurizio Memeo1, Luigi Catarini1, Carlo Sabba1
1Internal Medicine and Public Health, University of Bari, Italy, Bari, Italy. 2Statistics, University of Bari, Italy, Bari, Italy.

#436
EFFECTIVITY OF POSITRON EMISSION TOMOGRAPHY CT FOR METASTATIC HEPATOCELLULAR CARCINOMAS

Tomokazu Kawaoka, Hiroshi Aikata, Shoichi Takahashi, Kazuaki Chayama
Graduate School of Biomedical Science Hiroshima University, Hiroshima, Japan.

#437
POSITRON EMISSION TOMOGRAPHY (PET/CT) USING FLURO-CHOLINE ALLOWS TO DIFFERENTIATE BETWEEN ADENOMA AND FOCAL NODULAR HYPERPLASIA

Franck Bumsel1, Virginie Huchet5, Lionel Arrivé4, Dominique Wendum2, Francois Pavy3, Raouf Poupon1, Jean-Noel Talbot5, Olivier Rosmorduc1
1Hepatology, AP-HP, Hôpital Saint-Antoine, Faculté de Médecine Pierre et Marie Curie, Paris, France. 2Pathology, AP-HP, Hôpital Saint-Antoine, Faculté de Médecine Pierre et Marie Curie, Paris, France. 3Surgery, AP-HP, Hôpital Saint-Antoine, Faculté de Médecine Pierre et Marie Curie, Paris, France. 4Radiology, AP-HP, Hôpital Saint-Antoine, Faculté de Médecine Pierre et Marie Curie, Paris, France. 5Nuclear Medicine, AP-HP, Hôpital Tenon, Faculté de Médecine Pierre et Marie Curie, Paris, France.

Viral Hepatitis: Pathobiology

#438
THE HEPATIC TRANSCRIPTOME OF HCV INFECTION AND INTERFERON TREATMENT IN HEPATOCYTES RECOVERED FROM CHIMERIC MICE

Donna Douglas, Gordon Broderick, Jamie Lewis, Yutaka Yasui, David Bond, Norman Kneteman
University of Alberta, Edmonton, AB, Canada.
#439
HCV CORE–SPECIFIC ADAPTIVE REGULATORY T CELLS CAN SPECIFICALLY BE ACTIVATED IN PATIENTS WITH CHRONIC HEPATITIS C
Bettina Langhans1, Ingrid Braunschweiger2, Wibke Schulte1, Judith Satoguina2, Achim Hoerauf2, Tilman Sauerbruch1, Ulrich Spengler1
1University of Bonn, Department of Internal Medicine I, Bonn, Germany. 2University of Bonn, Institute of Medical Microbiology, Immunology and Parasitology, Bonn, Germany

#440
HEPATITIS C VIRUS CORE PROTEIN SELECTIVELY ACTIVATES CELL GROWTH FACTOR SIGNALING
Andrew Kim, Shigenobu Kawai, Waihong Chung, Eun Kim, Jack R. Wands, Jisu Li
Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI, USA

#441
APOLIPOPROTEIN C-IV EXPRESSION IS REGULATED BY KU ANTIGEN AND CORRELATES WITH TRIGLYCERIDE ACCUMULATION IN HCV INFECTED LIVER
Eun Kim, Jack R. Wands, Jisu Li
Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI, USA

#442
ESCAPE IN AN HLA B8-RESTRICTED CD8 EPITOPE IN HCV NS3 IS ASSOCIATED WITH VIRAL FITNESS COSTS
Cesar Oniangue-Ndza1, Shadi Salloum1, Christoph Neumann-Haefelin2, Anna Eckart1, Robert Thimme2, Sergei Viazov1, Michael Roggendorf1, Joerg Timm1
1Department of Virology, University of Duisburg-Essen, Essen, Germany. 2Department of Medicine, University of Freiburg, Freiburg, Germany

#443
GREEN FLUORESCENCE BASED ASSAYS FOR HEPATITIS C VIRUS REPLICATION AND INFECTIVITY IN CELL CULTURE
Sidhartha Hazari1, Robert F. Garry2, Takaji Wakita3, Srikanta Dash1
1Pathology and Lab Medicine, Tulane University of Health Sciences Center, New Orleans, LA, USA. 2Microbiology and Immunology, Tulane University School of Medicine, New Orleans, LA, USA. 3Virology II, National Institute of Infectious Diseases, Tokyo, Japan

#444
ARREST OF NATURAL KILLER (NK) CELL DEVELOPMENT IN THE EARLY STAGES OF ACUTE HCV INFECTION MAY REPRESENT A DIRECT EFFECT OF HCV CORE PROTEIN
Lucy Golden-Mason1, 2, Nicole Castelblanco1, Young S Hahn3, Hugo R. Rosen1, 2
1Division of Gastroenterology & Hepatology, Hepatitis C Center & Department of Medicine, University of Colorado Health Sciences Center, Denver, CO, USA. 2Integrated Program in Immunology, University of Colorado Health Sciences Center & National Jewish Hospital, Denver, CO, USA. 3Department of Microbiology & Pathology, University of Virginia Health Sciences Center, Charlottesville, VA, USA

#445
HEPATITIS C VIRUS REPLICATION SENSITIZES HUMAN HEPATOMA CELLS TO TRAIL-INDUCED APOPTOSIS
Richard Fischer1, Sebastian Gorke1, Lin Lan1, Sibylle J. Rau1, Takaji Wakita2, Hubert E. Blum1, Mirjam Zeisel3, Thomas F. Baumert2
1Department of Gastroenterology and Hepatology, University of Freiburg, Freiburg, Germany. 2Department of Virology II, National Institute of Infectious Diseases, Tokyo, Japan. 3Inserm U748, Université Louis Pasteur, Hopitaux Universitaires de Strasbourg, Strasbourg, France

#446
NEUTRALIZING ANTIBODY INDUCTION IN MONOTYPIC HEPATITIS C VIRUS INFECTIONS IN CHIMPANZEE DOES NOT CORRELATE WITH OUTCOME
Hisayoshi Watanabe1, Frances Wells1, Pei Zhang2, Marian E. Major1
1Laboratory of Hepatitis Viruses/Division of Viral Products, CBER/FDA, Bethesda, MD, USA. 2Division of Hematology, CBER/FDA, Bethesda, MD, USA

#447
SOCS-3 EXPRESSION AND HCV RELATED CHRONIC HEPATITIS: INSULIN RESISTANCE AND RESPONSE TO ANTIVIRAL THERAPY
Marcello Persico1, Mario Capasso2, Eliana Persico1, Monica Svello1, Roberta Russo2, Daniela Spano2, Lori Croce3, Vincenzo La Mura1, Francesco Moschella1, Flora Masutti3, Roberto Torella1, Claudio Tiribelli2, Achille Iolascon3
1Internal Medicine and Hepatology, SUN, Napoli, Italy. 2Biotecnologie Avanzate, CEINGE, Napoli, Italy. 3Centro Studi Fegato, Trieste, Italy

#448
COMPREHENSIVE ANALYSES OF HCV-RELATED CELL SIGNALING PATHWAYS USING CELLS WITH OR WITHOUT EXPRESSION OF HCV REPLICON AND THEIR CURED CELLS
Yuki Sakurai1, Naoya Sakamoto2, 1, Mina Nakagawa2, 1, Yuko Sekine-Osajima1, Megumi Tasaka1, Yasuhiro Itsui3, Cheng-Hsin Chen1, Mamoru Watanabe1
1Gastroenterology and Hepatology, Tokyo Medical and Dental University, Tokyo, Japan. 2Hepatitis Control, Tokyo Medical and Dental University, Tokyo, Japan
#449
INFECTION OF PRIMARY HUMAN HEPATOCYTES WITH RECOMBINANT HEPATITIS C VIRUS
Mirjam B. Zeisel1,2, Catherine Schuster1,2, Christine Thumm1,2, Cathy Royer1,2, Eric Soulier1,2, Philippe Bachellier3, Daniel Jaecq1, François Stoll-Keller1,2, Michel Doffoel4, Artur Kaul5, Ralf Bartenschlager5, Thomas F. Baumert1,4
1Inserm, U748, Strasbourg, France. 2Université Louis Pasteur, Strasbourg, France. 3Centre de Chirurgie Viscérale, Hépatique et de Transplantation Multiorganes, Université Louis Pasteur, Strasbourg, France. 4Service d’Hépatogastroentérologie, Hôpitaux Universitaires de Strasbourg, Strasbourg, France. 5Department of Molecular Virology, University of Heidelberg, Heidelberg, Germany

#450
AN ASSESSMENT OF THE ROLE OF SREBP1C IN THE PATHOGENESIS OF HCV-RELATED STEATOsis
Stuart McPherson1,2, Julie R. Jonsson2, Helen D. Barrie2, Andrew D. Clouston2, Elizabeth E. Powell1,2
1Hepatology, Princess Alexandra Hospital, Brisbane, QLD, Australia. 2Southern School of Medicine, University of Queensland, Brisbane, QLD, Australia. 3University of Newcastle, Newcastle upon Tyne, United Kingdom

#451
INVolvement of IL-7 and Thymic Stromal Lymphopoietin in Functional Impairment of Myeloid Dendritic Cells in Chronic Hepatitis C Virus infection
Hideki Miyatake1, Tatsuya Kanto1, Michiyu Inoue1, Mitsu Sakakibara1, Ichiro Itoh1, Masanori Miyazaki1, Naruyasu Kikita1, Naoki Hiramoto1, Tetsu Takehara1, Akinori Kasahara2, Norio Hayashi1
1Department of Gastroenterology and Hepatology, Osaka University Graduate School of Medicine, Suita, Japan. 2Department of General Medicine, Osaka University Graduate School of Medicine, Suita, Japan

#452
INSULIN RESISTANCE IN CHRONIC HEPATITIS C: A PROspective STUDY SHOWING AN ASSOCIATION OF INSULIN RESISTANCE WITH GENOTYPES 1 AND 4, VIRAL REPLICATION AND LIVER FIBROSIS
Rami Moucari1,2, Tarik Asselah1,5, Dominique Caazals-Hatem2, Hélène Voitot1, Nathalie Boyer5, Marie-Pierre Ripault5, Rodolphe Françoise Stoll-Keller1,2, Michel Doffoel4, Artur Kaul5, Ralf Bartenschlager5, Thomas F. Baumert1,4
1Inserm, U748, Strasbourg, France. 2Université Louis Pasteur, Strasbourg, France. 3Centre de Chirurgie Viscérale, Hépatique et de Transplantation Multiorganes, Université Louis Pasteur, Strasbourg, France. 4Service d’Hépatogastroentérologie, Hôpitaux Universitaires de Strasbourg, Strasbourg, France. 5Department of Molecular Virology, University of Heidelberg, Heidelberg, Germany

#453
EFFECT OF ADIPONECTIN ON THE CELLULAR IMMUNE RESPONSE IN CHRONIC HCV INFECTION
Clovis Palmer4, Andrew R. Lloyd4, Amany Zekry1,2
1Medicine, University of New South Wales, Sydney, NSW, Australia. 2School of Medical Sciences, University of New South Wales, Sydney, NSW, Australia

#454
POLYMORPHISMS IN ADRENERGIC RECEPTORS, ADIPONectin AND ADIPONECTIN RECEPTORS INFLUENCE FIBROSIS RATES AND RESPONSE TO THERAPY IN CHRONIC HCV
Amany Zekry1,2, Nicole Walley2, Michael Giguère1, Pierre Charneau5, John G. McHutchison3
1Medicine, University of New South Wales, Sydney, NSW, Australia. 2IGSP’s Centre for Population Genomics and Pharmacogenetics, Duke University, Durham, NC, USA. 3DSCRI, Duke University, Durham, NC, USA. 4Duke Institute for Genome Sciences & Policy, Duke University, Durham, NC, USA

#455
INVESTIGATION OF RESIDUAL HEPATITIS C VIRUS (HCV) IN PRESUMED RECOVERED SUBJECTS
Kei Fujiwara, Richard Y. Wang, Robert D. Allison, Cathy Schechterly, Francesco M. Marincola, Harvey Alter
Department of Transfusion Medicine, Clinical Center, National Institutes of Health, Bethesda, MD, USA

#456
UPREGULATION OF PROGRAMMED DEATH-1 (PD-1) ON HCV-SPECIFIC AND CMV-SPECIFIC CD8+ T CELLS IN CHRONIC HCV INFECTION ASSOCIATED WITH REVERSIBLE IMMUNE EXHAUSTION
Lucy Golden-Mason1,2, Brent Palmer3, Jared Klarquist1, John A. Mengshol1, Nicole Castelblanco1, Hugo R. Rosen1,2
1Division of Gastroenterology & Hepatology, Hepatitis C Center & Department of Medicine, University of Colorado Health Sciences Center, Denver, CO, USA. 2Integrated Program in Immunology, University of Colorado Health Sciences Center & National Jewish Hospital, Denver, CO, USA. 3Division of Clinical Immunology, University of Colorado Health Sciences Center & National Jewish Hospital, Denver, CO, USA

#457
HEPATITIS C VIRUS-INDUCED REACTIVE OXYGEN SPECIES CAUSE IRON ACCUMULATION IN MICE BY REDUCING HEPcidin TRANSCRIPTION
Sojhi Nishina1, Keisuke Hino2, Masaaki Korenaga1, Antonello Pietrangelo2, Yoichi Mizukami3, Takakazu Furutani1, Michiari Okuda1, Isao Hidaka1, Kiwamu Okita4, Isao Sakaida1
1Department of Gastroenterology and Hepatology, Yamaguchi University Graduate School of Medicine, Ube, Japan. 2Department of Basic Laboratory Sciences, Yamaguchi University Graduate School of Medicine, Ube, Japan. 3Department of Center for Gene Research, Yamaguchi University Graduate School of Medicine, Ube, Japan. 4Department of Gastroenterology and Hepatology, Shimonoseki Kohsei Hospital, Shimonoseki, Japan. 5Center for Hemochromatosis, Department of Internal Medicine, University of Modena and Reggio Emilia, Modena, Italy

#458
NATURAL HCV CORE VARIANTS REDUCE CELL GROWTH INHIBITION AND FACILITATE INDUCTION OF EPITHELIAL TO MESENCHYMAL TRANSITION (EMT) MEDIATED BY TGF-BETA
Serena Battagia1, Soizic Nobilet1, Olivier Bregerie1, Michelle Giguère1, Pierre Charneau1, Christian Bréchot5, Marie F. Bourgeade1
1CHB, INSERM, Villejuif, France. 2Virology, Institut Pasteur, Paris, France
#459
A CIRRHOSIS RISK SCORE IDENTIFIES THOSE CHRONIC HEPATITIS C INFECTED PATIENTS PRESENTING WITH NO LIVER FIBROSIS THAT ARE AT HIGH RISK FOR FIBROSIS PROGRESSION
Bradford Young1, Martina Gerotto2, Moira Marcolongo2, Francesca Dal Pero2, Robert Logier1, Charles Rowland1, Giada Sebasti2, Alfredo Alberti2.1
1Celera, Alameda, CA, USA. 2Venetian Institute of Molecular Medicine, Padova, Italy. 3Department of Clinical and Experimental Medicine, University of Padova, Padova, Italy

#460
EFFECTS OF HEME OXYGENASE-1 (HO-1) OVEREXPRESSION ON HEPATITIS C VIRUS (HCV) REPLICATION AND CELLULAR INJURY IN VITRO
Zhaowen Zhu1,2, Meleah Mathahs2,1, Feng Wen1,2, Kyle Brown2,1, Bruce A. Luxon1,2, Warren N. Schmidt1,2
1Division of GI & Hepatology, Department of Internal Medicine, University of Iowa, Iowa City, IA, USA. 2Research Services, Veterans Administration Medical Center, Iowa City, IA, USA

#461
COMPREHENSIVE GENE EXPRESSION ANALYSIS OF IRON METABOLISM-RELATED GENES IN PATIENTS WITH CHRONIC VIRAL HEPATITIS AND HEPATOCELLULAR CARCINOMA
Masao Honda, Teruyuki Ueda, Taro Yamashita, Ryuhei Nishino, Hajime Takatori, Shuichi Kaneko
Gastroenterology, Graduate School of Medical Science, Kanazawa University, Kanazawa, Japan

#462
AN ASSESSMENT OF THE ROLE OF ENDOPLASMIC RETICULUM (ER) STRESS IN THE PATHOGENESIS OF HCV
Stuart McPherson1,2, Elizabeth E. Powell1,2, Helen D. Barrie2, Andrew D. Clouston2, Julie R. Jansson2
1Hepatology, Princess Alexandra Hospital, Brisbane, QLD, Australia. 2Southern School of Medicine, University of Queensland, Brisbane, QLD, Australia. 3University of Newcastle, Newcastle-upon-Tyne, United Kingdom

#463
PROTECTION BY HLA-B27 IN HCV INFECTION: ROLE OF VIROLOGICAL AND IMMUNOLOGICAL FACTORS
Christoph Neumann-Haefelin1, Eva Dazert2, Susan McKiernan3, Damien Kelleher4, Hubert E. Blum1, Ralf Bartenschlager2, Robert Thimme1
1Department of Medicine II, University Hospital Freiburg, Freiburg, Germany. 2Department of Molecular Virology, University of Heidelberg, Heidelberg, Germany. 3St. James Hospital, Dublin, Ireland

#464
IMPAIRED TLR/RIG-I-MEDIATED INNATE IMMUNITY IN MYELOID DENDRITIC CELLS IN HCV-INFECTED INDIVIDUALS
Masanori Miyazaki, Tatsuya Kanto, Naruyasu Kakita, Michiyoshi Inoue, Ichiro Itose, Hideki Miyatake, Mitsuaki Sakakibara, Takayuki Yakushijin, Naoki Hiramoto, Tetsuo Takehara, Akinori Kasahara, Norio Hayashi
Osaka University Graduate School of Medicine, Suita, Japan

#465
ERADICATION OF HCV BY INTERFERON TREATMENT LEADS TO IMPROVEMENTS IN WHOLE-BODY INSULIN SENSITIVITY
Yasunori Kawaguchi, Toshihiko Mizuta, Yuichiro Eguchi, Tsutomu Yasutake, Keisuke Ario, Hirokazu Takahashi, Shinya Iwane, Iwata Ozaki
Internal Medicine, Saga Medical School, Saga, Japan

#466
INTRAHEPATIC ANGIPOIETIN-2 PROTEIN EXPRESSION MODULATION BY HEPATITIS C VIRUS: MAPK, PI3K AND REACTIVE OXYGEN SPECIES (ROS) IMPLICATION
Paloma Sanz-Cameno1, Samuel Martin-Vilchez1, Yolanda Rodriguez-Munoz1, Maria Jesus Borque1, Jose A. Moreno-Montagudo1, Pedro L. Majano2, Francisca Molina-Jimenez2, Manuel Lopez-Cabrera2, Ricardo Moreno-Otero1
1Liver Unit, Hospital universitario “La Princesa”, Madrid, Spain. 2Molecular Biology Unit, Hospital universitario “La Princesa”, Madrid, Spain

#467
LACK OF FUNCTIONAL RESTORATION BY PD1/PD-L1 BLOCKADE IN INTRAHEPATIC HCV-SPECIFIC CD8 T CELLS FROM CHRONICALLY HCV-INFECTED PATIENTS
 Nobuhiro Nakamoto1,2, David Kaplan1,2, Yun Li1,2, Jennifer Coleclough1,2, Abraham Shaked1, Mary Kaminski1, David A Price5, E. John Wherry3, Gordon Freeman4, Kyong-Mi Chang1,2
1University of Pennsylvania, Philadelphia, PA, USA. 2Philadelphia VA Medical Center, Philadelphia, PA, USA. 3The Wistar Institute, Philadelphia, PA, USA. 4Medical Oncology, Dana-Farber Cancer Institute, Boston, MA, USA. 5Weatherall Institute of Molecular Medicine, University of Oxford, Oxford, United Kingdom

#468
CRYoglobulinemia in Chronic Hepatitis C: A New Marker of Advanced Fibrosis and Severe Steatosis
Rami Moucar1,2, Pierre Bedossa3, Michel Vidaud4, Anna-Carolina Cardoso1, Marie-Pierre Ripault1, Nathalie Boyer1, Michèle Martin-Peignoux2, Marie Hélène Nicolas-Chaoune5, Dominique Valla1,2, Patrick Marcellin1,2, Tarik Asselah1,2
1Hepatology, Beaujon Hospital, Clichy, France. 2INSERM U773-CRB8, Beaujon Hospital, Clichy, France. 3Pathology, Beaujon Hospital, Clichy, France. 4Biochemistry, Beaujon Hospital, Clichy, France. 5Microbiology, Beaujon Hospital, Clichy, France.
#469
HIV AND GP120 ENHANCE HCV REPLICATION AND UPREGULATE TGF-β1
Wenyu Lin, Ethan Weinberg, Kyung Ah Kim, Lee F. Peng, Sun Suk Kim, Mark Brockman, Hernan Lopez-Morra, Carolina Bastos De Sao Borges, Guibenson Hypolite, Run-Xuan Shao, Raymond T. Chung
Gastrointestinal Unit, Department of Medicine, Massachusetts General Hospital, Harvard Medical School, Boston, MA, USA

#470
INCREASED IRF-1 AND IFN-α GENE EXPRESSION IN CHRONIC HEPATITIS C G-300A IRF-1 PROMOTER POLYMORPHISM A ALLELE CARRIERS
Parwez Aidery, Giuliano Ramadori, Sabine Mihm
Gastroenterology, Georg-August-Universität, Göttingen, Germany

#471
IMPAIRMENT OF CHEMOKINE RECEPTOR CXCR4- EXPRESSION IN HCV INFECTION AS POTENTIAL IMMUNE ESCAPE MECHANISM
Kerstin Herzer1, Christoph C. Schimanski1, Regina Bager1, Sandra Weyer1, Stefan Biesterfeld2, Gerd G. Otto3, Stephan Kanzler1, Peter R. Galle1
1Dept I of Medicine, Johannes Gutenberg University, Mainz, Germany. 2Department of Pathology, Johannes Gutenberg University, Mainz, Germany. 3Department of Transplantation and Hepatobiliarypancreatic Surgery, Johannes Gutenberg University, Mainz, Germany

#472
CONTROLLING B-CELL ACTIVATING FACTOR (BAFF/BLYS) LEVELS IN CHRONIC HEPATITIS C VIRUS INFECTION
Gerond Lake-Bakaar, Peter Tsang
Medicine, Weill Cornell University Medical Center, New York, NY, USA

#473
INVOLVEMENT OF REGULATORY T CELL DYNAMICS IN THE ACHIEVEMENT OF BIOCHEMICAL RESPONSE IN 48-WEEK PEG-IFNα2B AND RIBAVIRIN COMBINATION THERAPY FOR CHRONIC HEPATITIS C PATIENTS
Ichiro Ito1, Tatsuya Kanto1, Michiyo Inoue1, Naruyasu Kakita1, Masanori Miyazaki1, Hideki Miyatake1, Mitsuru Sakakibara1, Takayuki Yakushijin1, Naoki Hiramatsu1, Tetsuo Takehara1, Akinori Kasahara2, Norio Hayashi1
1gastroenterology and hepatology, Osaka university graduate school of medicine, Suita, Japan. 2General medicine, Osaka university graduate school of medicine, Suita, Japan

#474
ADIPONECTIN: A NEW INDEPENDENT PREDICTOR OF LIVER STEATOSIS AND RESPONSE TO IFN-A TREATMENT IN CHRONIC HEPATITIS C?
Theodoros A. Zagoras1, Christos Liaskas1, Eirini I. Rigopoulou1, Elias Togouidis1, Konstantinos Makaritsis1, Anastasios Gemenis1, George N. Dolekos1
1Dept. of Medicine, Academic Liver Unit and Research Lab of Internal Medicine, University of Thessaly, Medical School, Larissa, Greece. 2Laboratory of Immunology and Histocompatibility, University of Thessaly, Medical School, Larissa, Greece

#475
ABERRATIONS OF CELL CYCLE MACHINERY IN CHRONIC HEPATITIS C INFECTION
Medicine, Aga Khan University, Karachi, Pakistan

#476
SELECTION, EXPANSION AND FUNCTIONAL RESTORATION OF NS3-SPECIFIC CD4 T CELLS FROM HCV-INFECTED PATIENTS
Marta Bes1, Silvia Saulea1, Josep Quer2, Maria Cubero2, Jaume Guardia2, Lluís Puig1, Rafael Esteban2, Juan I. Esteban2
1Transfusion Safety Lab, Banc de Sang i Teixits, Barcelona, Spain. 2Liver Unit, Hospital Vall d’Hebron, Barcelona, Spain

#477
HCV CORE PROTEINS FROM PATIENTS WITH CHRONIC HEPATITIS C WITH OR WITHOUT STEATOSIS INDUCE GENOTYPE-DEPENDENT MORPHOLOGICAL CHANGES OF INTRACELLULAR LIPID DROPLETS
Aurélié Piodi, Philippe Chouteau, Hervé Lerat, Christophe Hezode, Jean-Michel Pawlotsky
Henri Mondor Hospital, University of Paris 12, Creteil, France

Viral Hepatitis: Virology

#478
MOLECULAR DETERMINANTS OF E6AP-DEPENDENT DEGRADATION OF HEPATITIS C VIRUS CORE PROTEIN
Ikuo Shoji, Kyoko Murakami, Kouichiou Fukuda, Motonao Osaki, Tetsuro Suzuki, Tatsu Miyamura, Takaji Wakita
Department of Virology II, National Institute of Infectious Diseases, Tokyo, Japan

#479
HUMAN MONOCLONAL ANTIBODIES RECOGNIZING A CONSERVED HCV E1 DOMAIN EFFECTIVELY NEUTRALIZE HCV IN THE CELL CULTURE (HCVCC) SYSTEM
Ann Union1, Erik Depla1, Jean-Christophe Meunier2, Vera Goossens1, Suzanne U. Emerson2, Sofie Priem1, Robert H. Purcell2, Geert Maertens1
1Therapeutics, Innogenetics NV, Zwijnaarde, Belgium. 2Laboratory of Infectious Diseases, NIAID, Bethesda, MD, USA

#480
CELL CULTURE-PRODUCED HEPATITIS C VIRUS IMPAIRS PLASMCYTOID DENDRITIC CELL MATURATION AND FUNCTION VIA DIRECT INTERACTION, BUT NOT INFECTION
Masaaki Shiina, Barbara Rehermann
Immunology Section, Liver Diseases Branch, NIDDK, National Institutes of Health, Bethesda, MD, USA

#481

HEPATITIS C P7 PROTEIN ALTERS THE PROTON CONDUCTANCE OF INTRACELLULAR MEMBRANE VESICLES

Ann L. Wozniak1, Stephen Griggen2, David Rawlands2, Mark Harris2, Steven A. Weinman1

1Neuroscience & Cell Biology, University of TX-Medical Branch, Galveston, TX, USA. 2Institute of Molecular and Cellular Biology, University of Leeds, Leeds, United Kingdom

#482

HEPATITIS C VIRUS NS5A BINDING TO NUCLEOSOME ASSEMBLY PROTEIN 1 (NAP 1) ACCELERATED HCV REPLICATION

Run-Xuan Shao1,2, Naoya Kato1, Motoyuki Otsuka1, Naoyuki Yamada3, Jin-Hai Chang3, Ryoosuke Muroyama1, Takao Kawabe1, Masao Omata1

1Gastroenterology, School of Medicine, University of Tokyo, Tokyo, Japan. 2Institute of Molecular and Cellular Biology, University of Southern California, Los Angeles, CA, USA. 3Research Institute for Microbial Diseases, Osaka University, Osaka, Japan.

#483

PRODUCTION OF INFECTIOUS GENOTYPE 1B HEPATITIS C VIRUS IN HUMAN HEPATOMA CELLS

CArlos Coito1, Smitha Kota1, David Willoughby2, Timothy Tellinghuisen1, Dongn Strongsberg1

1Infectology, Scripps-Florida, Jupiter, FL, USA. 2OceanRidge Biosciences, Jupiter, FL, USA

#484

THE CHOLESTEROL AND SPHINGOLIPIDS OF HEPATITIS C VIRUS PARTICLES PLAY CRITICAL ROLES IN THE VIRAL INFECTIVITY

Hideki Aizaki1, Masagi Fukasawa2, Hideki Tani3, Yoshiharu Mat-suura3,Kentaro Hanada3, Michael M. Lai4, Tatsuo Miyamura1, Takaji Wakita1, Tetsuro Suzuki1

1Virology II, National Institute of Infectious Diseases, Tokyo, Japan. 2Biochemistry and Cell Biology, National Institute of Infectious Diseases, Tokyo, Japan. 3Research Institute for Microbial Diseases, Osaka University, Osaka, Japan. 4Institute of Molecular Virology and Immunology, University of Southern California, Los Angeles, CA, USA

#485

NEUTRALIZING HOST RESPONSES IN HEPATITIS C VIRUS INFECTION TARGET VIRAL ENTRY AT POST-BINDING STEPS AND MEMBRANE FUSION

Anita Haberstroh1,2, Eva K. Schnober1,2, Patric Carol1,2, Heidi Barth1, Mirjam B. Zeis1,2, Hubert E. Blum1, Marlene Dreux4,5, George Koutsoudakis6, Ralf Hartenschlager6, Arvind Patel7, Catherine Schuster1,2, Françoise Stoll-Keller1,2, Eric Deplaa8, Michel Doffae9, François-Loïc Coisset10, Thomas F. Baumert11,2,9

1Department of Medicine II, University of Freiburg, Freiburg, Germany. 2Inserm, U748, Strasbourg, France. 3University Louis Pasteur, Strasbourg, France. 4Inserm, U758, Lyon, France. 5ENS Lyon, Lyon, France. 6Department of Molecular Virology, University of Heidelberg, Heidelberg, Germany. 7MRC Virology Unit, University of Glasgow, Glasgow, United Kingdom. 8Innogenetics NV, Ghent, Belgium. 9Service d’Hépatogastroentérologie, Hôpitaux Universitaires de Strasbourg, Strasbourg, France

#486

HLA CLASS I ASSOCIATED SEQUENCE POLYMORPHISMS IN HCV REVEAL REPRODUCIBLE PATTERNS OF IMMUNE ESCAPE – TOWARDS A COMPREHENSIVE MAP OF KEY RESIDUES FOR VACCINE DESIGN

Thomas Kuntzen1, Andrew Berical1, Niall Lennon2, David Hecker-man3, Joerg Timm4, Sharon Adams5, Julian C. Schulze zur Wiesch6, Jonathan Carlson7, Sarah Young2, Arthur Y. Kim1, Carl Kades1, Georg M. Lauer1, Francesco M. Marincola2, Raymond T. Chung7, Florian K. Bihi8, Andreas Cerny8, Christian Brander1, Ulrich Spengler9, Bruce W. Birren2, Bruce D. Walker1, Gerold Lake-Bakaar10, Eric S. Daar12, Ira M. Jacobson11, Edward D. Gomperts11, Brian R. Edlin11, Sharyne M. Donfield14, Andrew Talal11, Tony N. Marion10, Matthew R. Henn9, Todd M. Allen1

1Partners AIDS Research Center, Department of Infectious Diseases, Massachusetts General Hospital, Harvard Medical School, Charlestown, MA, USA. 2Broad Institute of Massachusetts Institute of Technology & Harvard, Cambridge, MA, USA. 3Microsoft Research, Redmond, WA, USA. 4Department of Virology, Essen University Hospital, Essen, Germany. 5Clinical Center, HLA Laboratory, National Institutes of Health, Bethesda, MD, USA. 6Medizinische Klinik I, Universitätsklinikum Hamburg Eppendorf, Hamburg, Germany. 7Gastroenterology Unit, Massachusetts General Hospital, Harvard Medical School, Boston, MA, USA. 8The Swiss HCV Cohort Study, Clinica Moncucco, Lugano, Switzerland. 9Department of Internal Medicine I, Bonn University Hospital, Bonn, Germany. 10Hepatitis C Cooperative, University of Tennessee Health Science Center, Memphis, TN, USA. 11Center for the Study of Hepatitis C, Weill Medical College of Cornell University, New York, NY, USA. 12Divisions of HIV Medicine and Infectious Diseases, Department of Medicine, Los Angeles Biomedical Research Institute at Harbor, UCLA Medical Center, David Geffen School of Medicine at UCLA, Los Angeles, CA, USA. 13The Saban Research Institute, Childrens Hospital Los Angeles, Los Angeles, CA, USA. 14Department of Biostatistics, Rho, Inc., Chapel Hill, NC, USA

#487

HEPATITIS C RESOLUTION CORRELATES WITH PATTERNED KIR RECEPTOR EXPRESSION ON KILLER LYMPHOCYTES

James C. Ryan1,2, Alexander Monto1,2, Mandeepeh Lehli, Michael Kim1,2, Daniel Tracy1,2, Sally George2, Alan P. Kennedy2, Teresa L. Wright1,3, Sue Currie1,2

1Medicine, GI Division, University of California, San Francisco, San Francisco, CA, USA. 2Division of Gastroenterology, San Francisco Veterans Affairs Medical Center, San Francisco, CA, USA.
#489
GENOMIC ANALYSIS OF HCV BREAKTHROUGHS OCCURRING DURING THE HALT-C TRIAL LEAD-IN TREATMENT PHASE
Hejun Yuan1, Mamta K. Jain1, Michael Gale2, William M. Lee1
1Internal Medicine, UTSW Medical Center at Dallas, Dallas, TX, USA. 2Microbiology, UTSW Medical Center at Dallas, Dallas, TX, USA

#490
INTERACTIONS OF CXCL-8 WITH INNATE ANTIVIRAL DEFENSES DURING HCV INFECTION
Jessica Wagoner1, Anne M. Wertheimer3, Hugo R. Rosen2, Stephen J. Polyak1
1Laboratory Medicine, University of Washington, Seattle, WA, USA. 2Gastroenterology, University of Colorado Health Sciences Center, Denver, CO, USA. 3Vaccine and Gene Therapy Institute, Beaverton, OR, USA

#491
A NOVEL IRES IN THE CORE-ENCODING REGION STIMULATES PRODUCTION OF MINI-CORE, A SMALL PROTEIN COMPRISED OF THE C-TERMINAL PORTION OF THE CORE PROTEIN
Francis J. Eng1, Laura K. McMullan2, Arielle L. Klepper1, Matthew J. Evans3, Charles M. Rice1, Suresh M. Desai3, Andrea D. Branch1
1Division of Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Center for the Study of Hepatitis C, Rockefeller University, New York, NY, USA. 3Infectious Diseases Research and Development, Abbot Laboratories, Abbot Park, IL, USA

#492
DEVELOPMENT OF JFH1-BASED INTERGENOTYPIC CELL CULTURE SYSTEMS OF HEPATITIS C VIRUS GENOTYPES 1-5 AND THEIR USE IN STUDIES OF VIRAL ENTRY AND NEUTRALIZATION
Judith M. Gottwein1, Troels Scheel1, Tanja Bertelsen Jensen1, Jan-nick Prentel1, Maria L. Knudsen1, Jasper Eugen-Olsen1, Jens Buch1,2
1Department of Infectious Diseases and Clinical Research Unit, Copenhagen University Hospital, Hvidovre, Denmark. 2Laboratory of Infectious Diseases, National Institutes of Health, Bethesda, MD, USA

#493
PLAQUE-FORMING ASSAYS FOR HEPATITIS C VIRUS AND ISOLATION OF HCV-JFH1 MUTANTS WITH ENHANCED CYTOPATHOGENICITY AND REPLICATION CAPACITY
Naoya Sakamoto1,2, Yuko Sekine-Osajima1, Kako Mishima1, Mina Nakagawa1,2, Megumi Tasaka1, Yuki Nishimura-Sakurai1, Yasuhiro Itsu1, Takaji Wakita3, Mamoru Watanabe1
1Dept. of Gastroenterology and Hepatology, Tokyo Medical and Dental Univ., Tokyo, Japan. 2Dept. for Hepatitis Control, Tokyo Medical and Dental Univ., Tokyo, Japan. 3Department of Virology II, National Institute of Infectious Diseases, Tokyo, Japan

#494
ANTI-MALARIAL DRUG CHLOROQUINE SUPPRESSES THE REPLICATION OF HCV REPLICON VIA PKR-INDEPENDENT MECHANISMS
Tomokazu Mizui1, Shunhei Yamashina1, Yoshiyuki Takei1, Kenichi Ikejima1, Tsuneo Kitamura1, Takashi Ueno2, Eiki Kominami2, Sumio Watanabe1
1Gastroenterology, Juntendo University, Tokyo, Japan. 2Biochemistry, Juntendo University, Tokyo, Japan. 3Gastroenterology, Me University, Miy, Japan

#495
CROSS-LINKING OF CD81 WITH HCV E2 REGULATES MIGRATION OF NATURAL KILLER (NK) CELLS IN A ROCK-DEPENDENT FASHION
Jacob Nattermann, Benjamin Krämer, Ludger Leifeld, Hans Dieter Nischalke, Tilman Sauerbruch, Ulrich Spengler
Internal Medicine I, University of Bonn, Bonn, Germany

#496
SCAVENGER RECEPTOR BI IS REQUIRED FOR AN ENTRY STEP CLOSELY LINKED TO CD81
Mirjam B. Zeisel1,2, George Koutsoudakis3, Eva K. Schnober1,4, Anita Haberstroh1,4, Hubert E. Blum4, François-Loïc Cosset1,2, Takaji Wakita5, Daniel Jaeck6, Michel Doffao7, Cathy Royer1,2, Eric Soulier1,2, Evelyne Schvoirer1,2, Catherine Schuster1,2, Françoise Stoll-Keller1,2, Ralf Bartenschlager2, Thomas Pletschmann2, Heidi Barth4, Thomas F. Baumert1,9
1Inserm, U748, Strasbourg, France. 2Université Louis Pasteur, Strasbourg, France. 3Department of Molecular Virology, University of Heidelberg, Heidelberg, Germany. 4Department of Medicine II, University of Freiburg, Freiburg, Germany. 5Inserm, U758, Lyon, France. 6ENS Lyon, Lyon, France. 7Department of Microbiology, Tokyo Metropolitan Institute for Neuroscience, Tokyo, Japan. 8Centre de Chirurgie Viscérale, Hépatique et de Transplantation Multi-organes, Université Louis Pasteur, Strasbourg, France. 9Service d’Hépatogastroentérologie, Hôpitaux Universitaires de Strasbourg, Strasbourg, France

#497
EVIDENCE FOR HIV AND HCV REPLICATION IN THE PERITONEAL MACROPHAGE
John J. Garber1, Arielle L. Klepper2, Julio A. Gutierrez2, Theresa L. Chang1, Aprilre Rapista3, Viktoriya Khaitova4, Douglas T. Dieterich2, Thomas D. Schiano3, Andrea D. Branch2
1Division of Infectious Diseases, Mount Sinai Medical Center, New York, NY, USA. 2Division of Liver Diseases, Mount Sinai Medical Center, New York, NY, USA. 3Recanati/Miller Transplantation Institute, Mount Sinai Medical Center, New York, NY, USA

#498
ESTABLISHMENT OF INFECTIOUS GENOTYPE 1B HEPATITIS C VIRUS CLONE TO HUMAN HEPATOCYTE CHIMERIC MOUSE
Takashi Kimura1, Michio Imamura1, Kiyomi Toyota1, Nobuhiko Hira1, Chiemi Naguchi1, Masataka Tsuchi1, Shoichi Takahashi1, Keiko Arakita2, Kazuaki Chayama1
1Department of Medicine and Molecular science, Graduate school of Biomedical Science, Hiroshima University, Hiroshima, Japan. 2Internal Medicine, Hiroshima-inen-Hospital, Hiroshima, Japan
#499

**HLA-E RESTRICTED RECOGNITION OF HEPATITIS C VIRUS BY A SUBSET OF IFN-γ SECRETING CD8+ T CELLS**

Daniela Schulte¹, Agathe Iwan¹, Monika Schulz¹, Claudia Zwank¹, Hans Dieter Nischalke¹, Ludger Leifeld¹, Elisabeth Weiss², Tilman Sauerbruch¹, Ulrich Spengler¹, Jacob Nattermann¹

¹Internal Medicine I, University of Bonn, Bonn, Germany. ²Biology II, University of Munich, Munich, Germany

#500

**HYPERPROLACTINEMIA ASSOCIATED WITH CHRONIC HEPATITIS C AND INDUCTION OF PROLACTIN EXPRESSION IN HUMAN PERIPHERAL BLOOD MONONUCLEAR CELLS STIMULATED BY HEPATITIS C VIRUS**

Rika Ishii¹, Takafumi Saito¹, Shao Li², Kazuo Okumoto¹, Jun-itsu Ito¹, Kazuhiko Sugahara¹, Koji Saito¹, Hitoshi Togashi¹, Sumio Kawata¹

¹Department of Gastroenterology, Yamagata University Faculty of Medicine, Yamagata, Japan. ²Department of Public Health, Yamagata University Faculty of Medicine, Yamagata, Japan

#501

**ANTIVIRAL EFFECTS OF INTERFERON-INDUCED PROTEINS, GBP-1, IFI-6-16 AND IFI-27 AND THEIR INTERACTIONS WITH HEPATITIS C VIRUS NONSTRUCTURAL PROTEINS**

Yasuhiro Itsui¹, Naoya Sakamoto¹, Mina Nakagawa¹, Yuki Sekine-Osajima¹, Yuki Nishimura-Sakurai¹, Megumi Tasaka¹, Mamoru Watanabe¹

¹Department of Gastroenterology and Hepatology, Tokyo Medical and Dental University, Tokyo, Japan. ²Department of Hepatitis Control, Tokyo Medical and Dental University, Tokyo, Japan

#502

**HCV-RELATED PROTEINS INDUCE PROINFLAMMATORY CYTOKINE PRODUCTION BY THE HUMAN KUPFFER CELL VIA THE MYD88-DEPENDENT SIGNALING CASCADE**

Hiroshi Kono, Kenichi Ishii, Naohiro Hosomura, Nobuyuki Tanaka, Masanori Matsuda, Hideki Fujii

First Department of Surgy, University of Yamanashi, Chuo, Japan

#503

**FULL-LENGTH SEQUENCE ANALYSIS OF HCV GENOTYPE-3A REVEALS NOVEL REGIONS OF HYPERVARIABILITY**

Isla Humphreys¹, Larry Park², Katja Pfafferott², Silvana Gaudieri², Paul Kleereman¹, Eleanor Barnes¹

¹Peter Medawar building, Nuffield department of medicine, Oxford, United Kingdom. ²Royal Perth Hospital, Centre for Clinical immunology and Biomedical statistics, Perth, WA, Australia
Poster Session 2
Sunday, November 4
POSTER VIEWING: 8:00 AM - 5:30 PM
Hynes, Exhibit Hall C

Presenters in attendance:
1:00 - 2:30 PM

Those posters identified as AASLD Presidential Poster of Distinction by a ribbon icon have received review scores that place them within the top 10 percent of all posters. We encourage you to make them a priority as you visit the poster sessions.

Cell Death and Hepatoxicity

#504
LOSS OF AUTOPHAGY PREVENTS APOPTOTIC CELL DEATH DURING ISCHEMIA-REPERFUSION IN THE MOUSE LIVER
Shunhei Yamashina1, Yoshiyuki Takei2, Tomokazu Mizui1, Kenichi Ikejima1, Masaaki Komatsu3, Takashi Ueno1, Eiki Kominami3, Sumio Watanabe1
1Dept of Gastroenterology, Juntendo university, Tokyo, Japan. 2Dept of Gastroenterology, Mie University, Tsu-City, Japan. 3Dept of Biochemistry, Juntendo University, Tokyo, Japan

#505
GP130, THE SIGNAL-TRANSUCING IL-6 RECEPTOR SUBUNIT, IS A SUBSTRATE OF CASPASES
Dirk Graf, Katrin Haslow, Ivo Münks, Johannes Bode, Dieter Häussinger
Clinic of Gastroenterology and Hepatology, Düsseldorf, Germany

#506
ENDOTOXIN INDUCES ER STRESS IN RAT PRIMARY HEPATOCYTES VIA STELLATE CELLS: ROLE OF JNK MAPK ACTIVATION
SeonHee Oh1, Noor Mohamed Jameel1, Donna B. Stolz2, Chandrashekhar R. Gandhi1
1Surgery, University of Pittsburgh, Pittsburgh, PA, USA. 2Cell Biology, University of Pittsburgh, Pittsburgh, PA, USA

#507
ARSENIC AT SUBHEPATOTOXIC DOSES SYNERGISTICALLY ENHANCES LIPOPOLYSACCHARIDE-INDUCED LIVER INJURY IN MICE
Gavin E. Arteel1,2, Heather L. Miller1, Theresa S. Chen1, Luping Guo1, Thomas J. Schlierf1, Juliane I. Beier1, J. Phillip Kaiser1, J. Christopher States1
1Dept of Pharmacology/Toxicology, University of Louisville, School of Medicine, Louisville, KY, USA. 2The James Graham Brown Cancer Center, University of Louisville, Louisville, KY, USA

#508
METFORMIN PROTECTS RAT HEPATOCYTES AGAINST APOPTOSIS VIA THE PI3-KINASE/AKT SURVIVAL PATHWAY, BUT HAS NO EFFECT ON NF-kB SIGNALING
Titia E. Vrenken, Laura Conde de la Rosa, Manon Buist-Homan, Klaas Nico Faber, Han Moshage
Gastroenterology and Hepatology, University Medical Center Groningen, Groningen, Netherlands

#509
ZINC SUPPLEMENTATION STIMULATES HEPATIC REGENERATION BY PRESERVING HEPATOCYTE NUCLEAR FACTOR-4α IN MICE SUBJECTED TO A LONG-TERM ETHANOL ADMINISTRATION
Xinjin Kang, Zhenyuan Song, Craig J. McClain, Y. James Kang, Zhanxiang Zhou
University of Louisville, Louisville, KY, USA

#510
QUALIFICATION OF FOUR SERUM BIOMARKERS OF HEPATOTOXICITY BY THE PREDICTIVE SAFETY TESTING CONSORTIUM (PSTC)
Shelli J. Schomaker1, Holly Jordan3, Frances Clemo1, Kyle Kolaja4, Patrick Wier2, William Mattes5
1Drug Safety Research and Development, Pfizer Inc., Groton, CT, USA. 2Safety Assessment, GlaxoSmithKline, King of Prussia, PA, USA. 3Safety Assessment, GlaxoSmithKline, Research Triangle Park, NC, USA. 4Toxicology, Roche, Palo Alto, CA, USA. 5Toxicology, Critical Path Institute, Rockville, MD, USA

#511
OXIDATIVE STRESS MODULATES THE EXPRESSION OF KRÜPPEL-LIKE FACTOR-6 AND ITS SPLICE-VARIANTS
Raquel Urtasun, Francisco Javier Cubero, Steven Yea, Scott L. Friedman, Natalia Nieto
Medicine/Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA

#512
P38- AND ERK- MAPK MEDIATE SUPEROXIDE-INDUCED APOPTOSIS OF ACTIVATED RAT HEPATIC STELLATE CELLS, WHICH IS REVERSED BY RETINOIC ACID
Noor Mohamed Jameel1, Chinnasamy Thirunavukkarasu1, Simon C. Watkins1, Tong Wu3, Chandrashekhar R. Gandhi1
1Surgery, University of Pittsburgh, Pittsburgh, PA, USA. 2Cell Biology, University of Pittsburgh, Pittsburgh, PA, USA. 3Pathology, University of Pittsburgh, Pittsburgh, PA, USA

#513
A PROTEOMIC APPROACH TO NUCLEOSIDE ANALOGUE ASSOCIATED MITOCHONDRIAL TOXICITY
Matthias Banasch1, Sven Liffers2, Wolfgang E. Schmidt1, Helmut E. Meyer2, Kai Stühler2
1Department of Internal Medicine 1, St. Josef-Hospital, University of Bochum, Bochum, Germany. 2Medical Proteome-Center, University of Bochum, Bochum, Germany
**SUPPRESSIVE EFFECTS OF RETINOIDS ON IRON-INDUCED OXIDATIVE STRESS IN LIVER BY DOWNREGULATION OF HEMOJUVELIN**

Hiroyuki Tsuchiya, Tomohiko Sakabe, Toshiko Hoshikawa, Goshi Shiota  
Grad. Schl. Med., Tottori University, Yonago, Japan

---

**HEPATO主旨 GROWTH FACTOR PROTECTS AGAINST OXIDATIVE INJURY INDUCED BY ETHANOL METABOLISM**

Argelia Valdes-Arzate, Luis E. Gómez-Quiroz, Cynthia Licona, Leticia Bucio, Veronica Souza, Elizabeth Hernandez, David Kushner,  
Tottori University, Yonago, Japan

---

**HEPATIC MITOCHONDRIAL α-TOCOPHEROL AND CARDIOLIPIN IN YOUNG RATS MAY AFFORD PROTECTION AGAINST BILE ACID-INDUCED MITOCHONDRIAL PATHWAYS OF CELL DEATH**

Ronald J. Sokol, Michael W. Devereaux, Genevieve C. Sparagna, Scott W. Leonard, Maret G. Traber, Eric Gumpricht  
University of Colorado School of Medicine, Denver, CO, USA. Oregon State University, Corvallis, OR, USA

---

**INHIBITION OF MITOCHONDRIAL PROTEIN OXIDATION FOLLOWING OXIDATIVE STRESS DOES NOT ALTER CELL FATE**

Jorge Allina, Bin Hu, Jingxiang Bai, Joseph Odin  
Mount Sinai School of Medicine, New York, NY, USA

---

**COSUPPLEMENTATION WITH VITAMIN E AND COENZYME Q(10) REDUCES IRON-OVERLOADED INDUCED HEPATIC STEATOSIS IN TRANSGENIC MICE EXPRESSING THE HEPATITIS C VIRUS POLYPROTEIN**

Masaaki Korenaga, Sohji Nishina, Keisuke Hino, Isao Sakaida  
Department of Gastroenterology & Hepatology, Yamaguchi University, Ube, Japan. Basic Laboratory Sciences, Yamaguchi University, Ube, Japan

---

**CORRELATION OF LIVER “COLLAGEN PROPORTIONATE AREA” BY COMPUTER ASSISTED IMAGE ANALYSIS AND HEPATIC VENOUS PRESSURE GRADIENT IN PATIENTS WITH RECURRENT HCV INFECTION AFTER LIVER TRANSPLANTATION**

Vincenza Calvaruso, Richard Standish, Pinelopi Manousou, Sergio Mainone, David Patch, James O’Beirne, Elias Xirochakis, Alexandros Sigalas, Alice Corbani, Amar P. Dhillon, Andrew K. Burroughs  
Liver Transplantation and Hepatobiliary Unit, Royal Free Hospital, London, UK. Histopathology, Royal Free Hospital, London, UK

---

**EVALUATION OF WEEK 12 RESPONSE ON SVR IN HCV POST TRANSPLANT PATIENTS UNDERGOING PEG/RBV THERAPY**

Reem H. Ghalib, Cheryl Levine, Blaine Hollinger, Rise Stribling, Terry Box, William R. Hutson, Anthony B. Post, Shobha N. Joshi, Anisha Steephen, Jeffrey Weinstein, Alejandro Mejia, Stephen Cheng  
Liver Institute at Methodist Dallas, Dallas, TX, USA. Baylor College of Medicine, Houston, TX, USA. University of Utah, Salt Lake City, UT, USA. University Hospitals of Cleveland, Cleveland, OH, USA. Tulane University, New Orleans, LA, USA

---

**CHRONIC HEPATITIS E : A NEW ENTITY IN ORGAN TRANSPLANT PATIENTS**

Nassim Kamar, Jean-Marie Péron, Leila Ouezzani, Jean-Michel Mansuy, Jannick Selves, Joelle Gutierrez, Jacques Izopet, Dominique Durand, Jean-Pierre Vinel, Lionel Rosetaing  
Service d’Hépato-Gastro-Entérologie, CHU PURPAN, Toulouse, France. Service de Néphrologie et Transplantation d’Organe, CHU RANGUEIL, Toulouse, France. Laboratoire de Virologie, CHU PURPAN, Toulouse, France. Service d’Anatoomo-Pathologie, CHU PURPAN, Toulouse, France

---

**POST-LIVER TRANSPLANT SURVIVAL IN HEPATITIS C PATIENTS IS IMPROVING, NOT DECLINING**

Jacqueline G. O’Leary, Lafaine M. Grant, Henry Randall, Nicholas Onaca, Linda Jennings, Goran Klintmalm, Gary L. Davis  
Internal Medicine, Baylor University Medical Center, Dallas, TX, USA. Surgery, Baylor University Medical Center, Dallas, TX, USA
#523
INTRAHEPATIC COVALENTLY CLOSED CIRCULAR DNA (CCC DNA) DETECTION IN PATIENTS TRANSPLANTED FOR HBV-RELATED CIRRHOSIS: A TOOL TO JUDGE FOR HBIG PROPHYLAXIS WITHDRAWAL IN LOW-RISK TRANSPLANT RECIPIENTS?
Ilaria Lenci1, Giuseppe Tisone1, Marco Ciotti2, Daniele Di Paolo1, Laura Taricciotti1, Fabio Marcuccilli3, Carlo F. Perno2, Mario Angelico1
1Liver Unit, University Tor Vergata, Rome, Italy. 2Laboratory of Molecular Virology, University Tor Vergata, Rome, Italy.

#524
HBV GENOTYPE C IS ASSOCIATED WITH HIGHER RATES OF HCC AND POST-LIVER TRANSPLANT (OLT) MORTALITY COMPARED TO GENOTYPES A, B AND D
Paul J. Gaglio2, Sundeep Singh1, Bulent Degertekin1, Michael B. Ishitan3, Munira Hussain1, Robert P. Perrillo4, Anna S. Lok1, Study Group NIH HBV Olt1
1University of Michigan, Ann Arbor, MI, USA. 2Columbia University, New York, NY, USA. 3Mayo Clinic, Rochester, MN, USA. 4Baylor University, Dallas, TX, USA.

#525
EVALUATION OF THE INTRAHEPATIC EXPRESSION OF TWO INTERFERON-INDUCIBLE PROTEINS, MXA AND IFI16, DURING ACUTE REJECTION AND VIRAL REINFECTION OF LIVER ALLOGRAFTS
Carlo Smirne1, Cinzia Borgona1, Carlo Fabris2, Barbara Azimonti1, Cecilia Marconi1, Elena Mossi1, Michela Burlone1, Pierluigi Tonitutto2, Rosalba Minisini1, Marisa Gariglia1, Mario Pirisi1
1Department of Clinical and Experimental Medicine, University of Eastern Piedmont “Amedeo Avogadro”, Novara, Italy. 2DPMSC, University of Udine, Udine, Italy.

#526
SUSTAINED VIROLOGICAL RESPONSE IN PATIENTS SUCCESSFULLY TREATED FOR RECURRENT HEPATITIS C FOLLOWING LIVER TRANSPLANTATION IS HIGHLY DURABLE
Les Lilly, Nigel Girgrah, George Therapondos
Toronto General Hospital, Toronto, ON, Canada.

#527
COMPARISON BETWEEN HEPATIC ELASTICITY MEASUREMENTS (FIBROSCAN®) AND LIVER BIOPSY IN PATIENTS TRANSPLANTED FOR HCV CIRRHOSIS
Flávio Feitosa1,2, Sylvie Radenne2, Tierry Bizollon2, Argemiro d’Oliveira1, Pierre Pradat2, Raymundo Parana1, Christian Trepo2
1Gastro-Hepatology, Hospital Prof Edgar Santos, Salvador, Brazil. 2Gastroenterologie et Hepatologie, Hopital de l’Hotel-Dieu, Lyon, France.

#528
HYPERIMMUNE ANTI-HBS PLASMA FOR THE PREVENTION OF HBV RECURRENCE AFTER LIVER TRANSPLANTATION: EFFICACY, SAFETY, KINETICS AND ECONOMICS IN 26 PATIENTS DURING 14-YEAR EXPERIENCE OF TWO CENTERS
Florian K. Bihl1, Vanina Gurtner2, Stefan Russman3, Loriana Di Giannmarino4, Claudia Steineman5, Andreas Cerny5, Antoine Hadengue1, Pietro Majno6, Emiliano Giastra1, Damiano Castelli2, Gilles Menth6
1Department of Gastroenterology and Hepatology, University Hospital Geneva, Geneva, Switzerland. 2Swiss Red Cross Blood Transfusion Service of Southern Switzerland, Lugano, Switzerland. 3Department of Clinical Pharmacology, University Hospital Zurich, Zurich, Switzerland. 4Department of Gastroenterology and Hepatology, University Hospital Lausanne, Lausanne, Switzerland. 5Hepatology Unit, Clinica Luganeses Moncucco, Lugano, Switzerland. 6Transplantation Unit, University Hospital of Geneva, Geneva, Switzerland.

#529
CAUCASIAN AMERICAN HEPATITIS B LIVER TRANSPLANT PATIENTS HAVE HIGHER RATES OF WAITLIST MORTALITY AND HBV RECURRENT THAN ASIAN AMERICANS
Nathalie H. Bzowej2, Emmet B. Keeffe3, Tram Tran4, Steven Han4, Sukru Emre6, Bulent Degertekin1, Anna S. Lok1, Study Group NIH HBV Olt1
1University of Michigan, Ann Arbor, MI, USA. 2California Pacific Medical Center, San Francisco, CA, USA. 3Stanford University, Palo Alto, CA, USA. 4Cedars Sinai Med Ctr, Los Angeles, CA, USA. 5UCLA, Los Angeles, CA, USA. 6Mt Sinai Med Ctr, New York, NY, USA.

#530
METABOLIC SYNDROME IS AN INDEPENDENT PREDICTOR OF FIBROSIS PROGRESSION IN PATIENTS WITH RECURRENT HEPATITIS C (HCV) AFTER LIVER TRANSPLANTATION (LT) USING SERIAL BIOPSY SPECIMENS
Ibrahim A. Hanouneh1, Charles M. Miller2, Arthur J. McCullough3, Rocio Lopez4, Federico Aucejo5, Ariel E. Feldstein5, Nizar N. Zein3
1Internal Medicine, Cleveland Clinic, Cleveland, OH, USA. 2General Surgery, Transplant Center, Cleveland Clinic, Cleveland, OH, USA. 3Gastroenterology and Hepatology, Cleveland Clinic, Cleveland, OH, USA. 4Biostatistics and Epidemiology, Cleveland Clinic, Cleveland, OH, USA. 5Pediatric Gastroenterology and Cell Biology, Cleveland Clinic, Cleveland, OH, USA.
#531
MULTICENTER RANDOMIZED TRIAL IN HCV-INFECTED PATIENTS TREATED WITH INTERFERON ALFA-2A AND RIBAVIRIN FOLLOWED BY RIBAVIRIN ALONE AFTER LIVER TRANSPLANTATION: FINAL REPORT

Yvon Calmus1, Christophe Duvoux2, Georges-Philippe Pageaux3, Michel Messner4, Philippe Wolfl, Lionel Rostaing5, Claire Vanlemmens2, Danielle Botta-Fridlund8, Sebastien Dharyancy9, Jean Gugenhheim10, Francois Durand11, Martine Neau-Cransac12, Olivier Boilor13, Olivier Chazouilleres14, Isabelle Lonjon-Domanec15, Laurence Samelson15, Didier Samuel16
1Hôpital Cochin, Paris, France. 2Hôpital Henri Mondor, Créteil, France. 3Hôpital Saint Eloi, Montpellier, France. 4Hôpital Pontchaillou, Rennes, France. 5Hôpital Hautepierre, Strasbourg, France. 6Hôpital Rangueil, Toulouse, France. 7Hôpital Minjoz, Besançon, France. 8Hôpital La Conception, Marseille, France. 9Hôpital Huriez, Lille, France. 10Hôpital L’Arche, Nice, France. 11Hôpital Beaujon, Clichy, France. 12Hôpital Pellegrin, Bordeaux, France. 13Hôpital Edouard Herriot, Lyon, France. 14Hôpital St Antoine, Paris, France. 15Roche, Neuilly sur Seine, France. 16Hôpital Paul Brousse, Villejuif, France

#532
HEPATITIS C VIRUS (HCV) INFECTION IS A PROTECTIVE FACTOR FOR HEPATITIS B VIRUS REACTIVATION (HBV) AFTER RECEIVING HEPATITIS B CORE POSITIVE (HBCAB+) DONORS FOR LIVER TRANSPLANTATION (LT)

Mauricio Orrego1, Ricardo Restrepo1, Barbara Aguilar2, Victor Araya1, Kenneth D. Rothstein1, Cosme Manzarbeitia2, David J. Reich2, Santiago Munoz1
1Center For Liver Disease, Albert Einstein Medical Center, Philadelphia, PA, USA. 2Surgery/Liver Transplantation Program, AEMC, Philadelphia, PA, USA

#533
HIGH PREVALENCE OF GLOMERULONEPHRITIS IN PATIENTS WITH END-STAGE HCV-INDUCED CIRRHOSIS

Brendan McGuire1, Bruce A. Julian1, Jan Novak2, Steve Bynon3, William J. Cook4, Stacy Eddleman1, Devin E. Eckhoff3
1Medicine, University of Alabama, Birmingham, AL, USA. 2Microbiology, University of Alabama, Birmingham, AL, USA. 3Surgery, University of Alabama, Birmingham, AL, USA. 4Pathology, University of Alabama, Birmingham, AL, USA

#534
RAPID FIBROSIS IN HCV-PATIENTS AFTER LIVER TRANSPLANTATION IS ASSOCIATED WITH AN UPREGULATION OF COLLAGEN TYPE I, MMP-9 AND TIMP-1

UlF Neumann1, Martin Ruehl2, Tarkan Dagdelen2, Friedmar Delissen2, Walburga Dieterich2, Maximilian Schmeding1, Martin Zeitz2, Peter Neuhaus1, Rajan Somasundaram2
1Department of Surgery, Charité-Campus Virchow, Berlin, Germany. 2Gastroenterology/Hepatology, Charité-Campus B.Franklin, Berlin, Germany. 3Department of Gastroenterology, Friedrich-Alexander University, Erlangen-Nuernberg, Germany

#535
ANTI-HCV IMMUNE RESPONSES MODULATE RECURRENT OF HCV INFECTION AND SEVERITY OF LIVER HISTOLOGY AFTER LIVER TRANSPLANTATION IN HIV/HCV CO-INFECTED PATIENTS

A. Samri1,2, Anne-Marie Roque-Afonso3, Anne Beran1,4, C. Fera2,5, E. Dussaux6,7, Didier Samuel1,7, B. Autran2,3, Jean-Charles Duclos-Vallée1,6
1Centre Hépato-Biliaire, AP-HP Hôpital Paul Brousse, Villejuif, France. 2Unité 543 Cell Immunology, Inserm, Paris F-75013, France. 3UMR-S 543, AP-HP Hôpital Pitié Salpêtrière, Paris F-75013, France. 4UMR-S 543, Université Pierre et Marie Curie Paris VI, Paris F-75013, France. 5Département de Virologie, AP-HP Hôpital Paul Brousse, Villejuif F-94804, France. 6U 785, Inserm, Villejuif F-94804, France. 7UMR-S 785, Univ Paris-Sud, Villejuif F-94804, France. 8Département de Microbiologie, AP-HP Hôpital Paul Brousse, Villejuif F-94804, France

#536
SERUM LEVELS OF FIBROSIS PROGRESSION BIOMARKERS MEASURED EARLY AFTER LT ARE ASSOCIATED TO SEVERE HCV RECURRENCE

Dariela Micheloud1, Magdalena Salcedo2, Salvador Resino1, Diego Rincon2, Emilio Alvarez3, Gerardo Clemente4, Maria Vega Catalina2, Judith Gomez-Camarena2, Raquel Lorente1, Maria Angeles Muñoz-Fernandez1, Rafael Baraeraes2
1Molecular Immuno-Biology Laboratory, HGU Gregorio Marañon, Madrid, Spain. 2Liver Transplant Unit, HGU Gregorio Marañon, Madrid, Spain. 3Pathology Department, HGU Gregorio Marañon, Madrid, Spain

#537
HLA-DRW LOCUS DISPARITY IS ASSOCIATED WITH WORSE OUTCOME IN HCV TRANSPLANT RECIPIENTS

Alexandros Sigalas1, Pinelopi Manousou1, Elias Xiouchakis1, Vincenza Calvaruso1, Alice Corbani1, Graham Shirley3, Dimitrios N. Samonakis1, James O’Beirne1, David Patch1, Nancy Rolando1, Keith Rolles4, Brian Davidson4, Federica Grillo5, Amar P. Dhillon2, Andrew K. Burroughs1
1Liver Transplantation and Hepatobiliary Unit, Royal Free Hospital, London, United Kingdom. 2Histopathology, Royal Free Hospital, London, United Kingdom. 3Antony Nolan Centre, Antony Nolan Trust, London, United Kingdom. 4Surgery, Royal Free Hospital, London, United Kingdom

#538
TRANSIENT ELASTOGRAPHY (TE) IS AN ACCURATE TOOL IN MONITORING LIVER TRANSPLANTED (LT) PATIENTS WITH RECURRENT HEPATITIS C

Cristina Rigamonti1, Maria Francesca Donato1, Francesca Agnelli1,2, Mirella Fraquelli2, Giovanni Casazza3, Giorgio Rossi4, Massimo Colombo1
1First Division of Gastroenterology, IRCCS Fondazione Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena, Milan, Italy. 2Second Division of Gastroenterology, IRCCS Fondazione Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena, Milan, Italy. 3Department of Statistic and Biometry, University of Milan, Milan, Italy. 4Liver Transplant Unit, IRCCS Fondazione Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena, Milan, Italy
#539

**PATIENTS WITH HCV-INDUCED CIRRHOSIS WITH IMMUNE-COMPLEX GLOMERULONEPHRITIS HAVE PROGRESSIVE PROTEINURIA AFTER LIVER TRANSPLANTATION**

RESECTION OF HEPATOCELLULAR CARCINOMA: LONG-TERM OUTCOME

Stefan Grune 1, Hans-Juergen Schlitt 2, Reiner Wiest 1, Frank Klebl 1, Aiman Obed 1, Juergen Schoelmerich 1, Gabi I. Kirchner 1

1Internal Medicine I, University Hospital of Regensburg, Regensburg, Germany. 2Clinic of Surgery, University Hospital of Regensburg, Regensburg, Germany

MINIMISING BILIARY COMPLICATIONS AFTER TRANSPLANTATION OF LIVERS FROM DONORS AFTER CARDIAC DEATH

Paolo Muiesan, Adam Bartlett, Wayel Jassem, Walid Faraj, Mohamed Rela, Nigel Heaton

Institute of Liver Studies, King’s College Hospital, London, United Kingdom

ALLOGRAFT SURVIVAL IS DECREASED IN PATIENTS WITH RECURRENT PRIMARY SCLerosING CHOLANGITIS

Cynthia Levy 1,2, Claudia O. Zein 3, Chaoru Chen 4, David R. Nelson 2

1Division of Gastroenterology and Hepatology, Malcolm Randall VAMC, Gainesville, FL, USA. 2Division of Gastroenterology, Hepatology and Nutrition, University of Florida, Gainesville, FL, USA. 3Division of Gastroenterology and Hepatology, Cleveland Clinic, Cleveland, OH, USA

NATIVE RENAL FUNCTION ONE YEAR FOLLOWING COMBINED LIVER-KIDNEY TRANSPLANT

Seaborn A. Roddenberry, George E. Loss, Ian Carmody, Ari J. Cohen

Section of Transplant Surgery, Ochsner Clinic, New Orleans, LA, USA

DEVELOPMENT OF A UK SCORE FOR PATIENTS WITH END-STAGE LIVER DISEASE

Kerri M. Barber 1, Sue E. Pio I 1, Joanne E. Blackwell 1, Dave Collett 1, James M. Neuberger 2, Alexander E. Gimson 2

1Statistics and Audit, UK Transplant, Bristol, United Kingdom. 2Hepatobiliary and Liver Transplant Unit, Addenbrooke’s Hospital, Cambridge, United Kingdom. 3Liver Unit, Queen Elizabeth Hospital, Birmingham, United Kingdom

PROPOSAL OF NEW SELECTION CRITERIA FOR LIVING DONOR LIVER TRANSPLANTATION CANDIDATES FOR HEPATOCELLULAR CARCINOMA

Akinobu Taketomi, Kensaku Sanefuji, Tomohiro Iguchi, Hiroto Kayashima, Noboru Harada, Keishi Sugimachi, Yo-ichi Yamashita, Tohru Ikekami, Tomoharu Yoshizumi, Yuji Soejima, Yoshihiko Mae-hara

Department of Surgery and Science, Kyushu University, Fukuoka, Japan

C4D IMMUNOHISTOCHEMICAL (IHC) REACTIVITY AS AN ADJUNCT IN DISTINGUISHING BETWEEN ACUTE CELLULAR REJECTION (ACR) AND RECURRENT HEPATITIS C VIRAL (RHCV) INFECTION IN LIVER TRANSPLANTS

Luminita Marinescu 1, Danisa Mandrich 1, Richard Cartun 1, David Hull 2, John Polio 3, Mike Grupka 3, Saverio Ligato 1

1Pathology, Hartford Hospital, Hartford, CT, USA. 2Transplant Surgery, Hartford Hospital, Hartford, CT, USA. 3Transplant Medicine, Hartford Hospital, Hartford, CT, USA
#614

PULMONARY AND BLOOD STREAM INFECTIONS IN ADULT LIVER TRANSPLANT RECIPIENTS

Maartje A. van den Broek1, Fuat Saner2, Steven W. Olde Damink1, Peter M. Rath3, Andreas Paul2, Silvio Nadalin2, Christoph E. Broelsch2, Massimo Malagò2
1Department of Surgery, University hospital Maastricht, Maastricht, Netherlands. 2Department of General, Visceral and Transplantation Surgery, University hospital Essen, Essen, Germany. 3Institute of Medical Microbiology, University of Essen, Essen, Germany

#615

OUTCOME DIFFERENCES AFTER LIVING DONOR LIVER TRANSPLANTATION (LDLT) IN ADULTS WITH AUTOIMMUNE AND CHOLESTATIC LIVER DISEASES: SRTR ANALYSIS

Adel Bozorgzadeh2, Parvez S. Mantry1,2, Randeep Kashyap2
1Division of Gastroenterology and Hepatology, Strong Memorial Hospital, Rochester, NY, USA. 2Division of Solid Organ Transplantation and Hepatobiliary Surgery, Strong Memorial Hospital, Rochester, NY, USA

#616

TRANSPLANT COSTS OF ADULT LIVING DONOR LIVER TRANSPLANTATION AT AN EXPERIENCED TRANSPLANT CENTER ARE SIMILAR TO DECEASED DONOR LIVER TRANSPLANTATION DESPITE INCREASED SURGICAL COSTS

Jennifer C. Lai1, Jean C. Emond2,4, Robert S. Brown3,4
1Medicine, New York Presbyterian Hospital, Columbia, New York, NY, USA. 2Surgery, Columbia University College of Physicians & Surgeons, New York, NY, USA. 3Medicine, Columbia University College of Physicians & Surgeons, New York, NY, USA. 4Center for Liver Disease & Transplantation, Columbia University College of Physicians & Surgeons, New York, NY, USA

#617

SUCCESSFUL ALGORITHM FOR SELECTIVE LIVER BIOPSY IN THE RIGHT LOBE LIVER DONOR (RLD)

Mary Ann Simpson, Jennifer E. Verbesey, Urmila Khettry, Fredric Gordon, James J. Pomposelli, Roger L. Jenkins, Elizabeth A. Pomfret Liver transplantation, Lahey Clinic, Burlington, MA, USA

#618

HIGH MELD SCORES DO NOT PREDICT ONE-YEAR SURVIVAL RATE OF PATIENTS WITH A SMALL-FOR-SIZE GRAFT IN ADULT LIVING DONOR LIVER TRANSPLANTATION

Nam-Joon Yi1, Kyung-Suk Suh1, Hae Won Lee1, Woo Young Shin1, Jung-Hwan Yoon2, Kuhn Uk Lee1
1Surgery, Seoul National University College of Medicine, Seoul, South Korea. 2Internal Medicine, Seoul National University College of Medicine, Seoul, South Korea

#619

IMPACT OF ISCHEMIC PRECONDITIONING IN GRAFT FUNCTION AND INFLAMMATORY MEDIATORS IN ORTHOTOPIC LIVER TRANSPLANTATION

Linda E. Muñoz Espinosa1,2, Homero Zapata2, Paula Cordero1, Miguel Escobedo2, Liliana Torres1, Belia Garduño2, Edelmiro Perez2, Magadalena Cepeda1, Marcela De Luna1, Amanda Mendoza1, Bricehidy Garza1, Eloy Caballero, Joan Roselló5
1Liver Unit, University Hospital “Dr. Jose Eleuterio Gonzalez”, Monterrey, Mexico. 2Transplants Department, University Hospital, Monterrey, Mexico. 3anesthesiology department, University Hospital, Monterrey, Mexico. 4Pathology Department, University Hospital, Monterrey, Mexico. 5Department of Experimental Pathology, Bio-medical Investigation Institute of Barcelona, Barcelona, Spain

Denotes AASLD Presidential Poster of Distinction
#623
ASSESSMENT OF REPRODUCIBILITY OF CREATININE MEASUREMENT AND MELD SCORING IN FOUR LIVER TRANSPLANT UNITS IN THE UK

Carol Goulding1, Evangelous Cholongitas1, Devaki Nair1, Andrew Kerry1, Murat Akoyun2, Simon Walker2, Derek Manus3, David McClure3, Neville Jamieson3, David Cartwright3, David Patch1, Andrew K. Burroughs1
1Liver Transplant Unit, Royal Free Hospital, London, United Kingdom. 2Dept of Transplantation, Royal Infirmary of Edinburgh, Edinburgh, United Kingdom. 3HPB Surgery and Liver Transplant Unit, Freeman Hospital, Newcastle, United Kingdom. 4Liver Transplant Unit, Addenbrooke’s Hospital, Cambridge, United Kingdom

#624
DOES HEALTH RELATED QUALITY OF LIFE CORRELATE WITH THE MODEL FOR END STAGE LIVER DISEASE SCORE BEFORE LIVER TRANSPLANTATION?

Eric T. Castaldo, Robert T. Russell, Irene D. Feurer, C. Wright Pinson
Vanderbilt University Medical Center, Nashville, TN, USA

#625
SHOULD DONOR ORGANS AND RECIPIENTS BE MATCHED IN LIVER TRANSPLANTATION? AN ANALYSIS OF THE UNITED KINGDOM AND IRELAND LIVER TRANSPLANT DATABASE

Muhammad F. Dawwas1, David Collett3, Kerri M. Barber3, Christopher J. Watson1, James M. Neuberger2, Alexander E. Gimson1
1Hepatobiliary and Liver Transplant Unit, Addenbrooke’s Hospital, Cambridge University Hospitals NHS Foundation Trust, Cambridge, United Kingdom. 2Liver Unit, Queen Elizabeth Hospital, Birmingham, United Kingdom. 3Statistics and Audit Directorate, UK Transplant, Bristol, United Kingdom

#626
LIVER TRANSPLANTATION FOR HEPATOCELLULAR CARCINOMA: VALIDATION OF A NEW PROGNOSTIC SCORE PREDICTING OVERALL SURVIVAL

Thomas Decaens1, Françoise Roudot-Thoraval2, Hanana Badran1, Carole Meyer1, François Durand3, Rene Adam3, Olivier Boillot1, Claire Vanlenens10, Jean Gugenheim18, Sebastien Dharancy9, Pierre-Henri Bernard15, Philippe Campagnon6, Yvon Calmus5, Jean Hardwigsen13, Christian Ducet14, Georges-Philippe Pageaux11, Marie Noëlle Hillement16, Olivier Chazouillères6, Daniel Cherqui17, Christophe Duvoix1
1Hepatology, Hopital Henri Mondor, Creteil, France. 2Public Health, Hopital Henri Mondor, Creteil, France. 3Liver transplantation, Hopital Hautepierre, Strasbourg, France. 4Liver transplantation, Hopital Ponchaillou, Rennes, France. 5Hepatology, Hopital Cochin, Paris, France. 6Hepatology, Hopital St Antoine, Paris, France. 7Hepatology, Hopital Beaujon, Clichy, France. 8Centre hepatobiliaire, Hopital Paul Brousse, Villejuif, France. 9Hepatology, Hopital Claude Huriez, Lille, France. 10Hepatology, Hopital Jean Minjoz,Besanjon, France. 11Hepatology, Hopital St Etienne, Montpellier, France. 12Liver transplantation, Hopital Edouard Herriot, Lyon, France. 13Liver transplantation, Hopital La Conception, Marseille, France. 14Liver transplantation, Hopital La Croix Rousse, Lyon, France. 15Hepatology, Hopital St Andre, Bordeaux, France. 16Hepatology, CHRU, Grenoble, France. 17Liver transplantation, Hopital Henri Mondor, Creteil, France. 18Liver transplantation, Hopital l’Archet, Nice, France

#627
HEPATECTOMY FOR HEPATOCELLULAR CARCINOMA AT LIVER TRANSPLANT CENTERS IS ASSOCIATED WITH REDUCED IN-HOSPITAL MORTALITY

Geoffrey C. Nguyen, Dorry L. Segev, Warren R. Maley, Paul J. Thuluvath
Medicine & Surgery, Johns Hopkins University School of Medicine, Baltimore, MD, USA

#628
TREATMENT OUTCOMES OF TRANSCATHETER ARTERIAL CHEMOINFUSION (TACI) IN PATIENTS WITH UNRESECTABLE HEPATOCELLULAR CARCINOMA (HCC) PRIOR TO ORTHOTROPIC LIVER TRANSPLANTATION

Whitney de Luna, Bo Yoon Ha, Ajaz Ahmed, Daniel Sze, Emmet B. Keeffe, Mindie H. Nguyen
Stanford University, Stanford, CA, USA

Experimental Hepatocarcinogenesis

#629
INOS AND COX-2 SYNERGISTICALLY ENHANCE PGE2 PRODUCTION THROUGH S-NITROSYLATION OF CYTOSOLIC PHOSPHOLIPASE A2α IN HUMAN CHOLANGIOCARCINOMA CELLS

Lihong Xu, Chang Han, Kyu Lim, Tong Wu
Department of Pathology, University of Pittsburgh, School of Medicine, Pittsburgh, PA, USA

#630
ROLE OF IKKβ/NF-κB ACTIVATION FOR DEVELOPMENT OF LIVER METASTASIS

Shin Maeda1,2, Yohko Hikiba1, Michael Karin2, Masao Omata3
1Gastroenterology, Institute for adult diseases, Asahi Life Foundation, Tokyo, Japan. 2Pharmacology, University of California, San Diego, La Jolla, CA, USA. 3Gastroenterology, University of Tokyo, Tokyo, Japan

#631
A PROTECTIVE ROLE FOR ADIPONECTIN IN HUMAN HEPATOCELLULAR CARCINOMA: ACTIVATION OF AMPK INHIBITS HEPG2 PROLIFERATION IN VITRO AND STUNTS TUMOR GROWTH IN HEPG2-NUDE MICE XENOGRAFTS

Neeraj K. Saxena1, Xiaokun Ding1, Dipali Sharma2, Frank A. Anania1
1Medicine, Division of Digestive Diseases, Emory University School of Medicine, Atlanta, GA, USA. 2Haematology and Oncology, Winship Cancer Institute School of Medicine, Atlanta, GA, USA
#632
CANCER TARGETED AND TISSUE SPECIFIC GENE THERAPY OF IN VIVO HEPATOCELLULAR CARCINOMA MODEL BY HTERT-TARGETING TRANS-SPlicing RIBOZYME AND LIVER SPECIFIC PROMOTER
Jin S. Jeong1, Sang Y. Han2, Min S. Song3, Seong W. Lee4, In H. Kim4
1Pathology, Medical Center for Cancer Molecular Therapy, Dong-A University College of Medicine, Busan, South Korea. 2Internal Medicine, Dong-A University College of Medicine, Busan, South Korea. 3Molecular Biology, Institute of Nanosensor and Biotechnology, Dankook University, Seoul, South Korea. 4Research Institute and Hospital, National cancer center, Goyang, South Korea

#633
DELETION OF THE GNMT GENE PREDISPOSES TO LIVER INJURY AND DEVELOPMENT OF HEPATOCELLULAR CARCINOMA
M Luz Martinez-Chantar2, Mercedes Vázquez-Chantada2, Zigmund Luka3, Usue Ariz2, Nuria Martinez2, Conrad Wagner3,4, Shelly C. Lu1, José M. Mato3
1Medicine, Keck School of Medicine USC, Los Angeles, CA, USA. 2CIC bioGUNE, Derio, Spain. 3Biochemistry, Vanderbilt University, Nashville, TN, USA. 4Medical Affairs, Tennessee Valley Medical Center, Nashville, TN, USA

#634
RELEVANCE OF IGF SIGNALING PATHWAY IN HUMAN HEPATOCELLULAR CARCINOMA, AND PRE-CLINICAL ASSESSMENT OF NOVEL TARGETED THERAPIES
Victoria Tovar1, Clara Alsinet1, Manel Solé1, Augusto Villanueva2, Derek Chiang3, Laia Cabellos1, Adriana Lázaro1, Myron Schwartz2, Vincenzo Mazzaferraro4, Jordi Bruix1, Josep M. Llovet1,2
1Liver Unit and Pathology Department, IDIBAPS- Hospital Clinic, Barcelona, Spain. 2Mount Sinai Liver Cancer Program. Division of Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 3Cancer Program, Broad Institute of Harvard and MIT, Cambridge, Boston, MA, USA. 4National Cancer Institute, Milan, Italy

#635
PREVENTION OF INTRAHEPATIC METASTASIS OF HEPATOCELLULAR CARCINOMA BY COMBINATION OF SUICIDE GENE THERAPY AND MONOCYTE CHEMOATTRACTANT PROTEIN-1 DELIVERY IN MICE
Kaheita Kakinoki1, Yasunari Nakamoto1, Takashi Kagaya1, Tomoya Tsuchiyama1, Yoshio Sakai1, Naofumi Mukaida2, Shuichi Kaneko1
1Disease Control and Homeostasis, Graduate School of Medical Science, Kanazawa university, Kanazawa, Japan. 2Division of Molecular Bioregulation, Cancer Research Institute, Kanazawa university, Kanazawa, Japan

#636
IFNγ IS CRITICALLY REQUIRED FOR IL-12-MEDIATED NK CELL ACTIVATION AND ANTI-TUMOR EFFECT IN THE LIVER
Akio Uemura, Tetsuo Takehara, Hayato Hikita, Akira Sasakawa, Keisuke Kohga, Ryuotaro Sakamori, Shinjiro Yamaguchi, Takuya Miyagi, Tomohide Tatsumi, Kazuyoshi Ohkawa, Tatsuya Kanto, Naoki Hiramatsu, Norio Hayashi
Dept. of Gastroenterology and Hepatology, Osaka Graduate School of Medicine, Suita, Japan

#637
LIBRARY OF GENETIC ASSOCIATIONS: CONNECTING COMPLEX LIVER DISEASES AND GENETICS
Stefan Buchkremer, Jasmin Hendel, Markus Krupp, Arndt Weinmann, Kai Schlamp, Peter R. Galle, Andreas Teufel
Department of Medicine I, Johannes Gutenberg University, Mainz, Germany

#638
INHIBITION OF HEPATIC TUMOR ANGIogenesis WITH MET INHIBITORS
Piguet Anne-Christine1, Daniel Aebersold2,3, Willy Hofstetter4, Jean-François Dufour1, Yitzhak Zimmer2,3
1Department of Clinical Pharmacology, University of Bern, Bern, Switzerland. 2Department of Radiation Oncology, Inselspital, University of Bern, Bern, Switzerland. 3Department of Clinical Research, Radiation Oncology, University of Bern, Bern, Switzerland. 4Department of Clinical Research, Bone Biology, University of Bern, Bern, Switzerland

#639
PEGYLATED INTERFERON ATTENUATES WNT/β-CATENIN SIGNALING IN HEPATOCELLULAR CANCER
Michael D. Thompson, Gang Zeng, Ben Cieply, Satdarshan P. Monga
University of Pittsburgh, Pittsburgh, PA, USA

#640
EXPLOITING THE MULTIPLE MECHANISMS OF SORAFENIB: TUMOR GROWTH INHIBITION WITH A NOVEL COMBINATION OF SORAFENIB AND RAPAMYCIN TARGETING BOTH RAS AND MTOR PATHWAYS
Pippa Newell1, Augusto Villanueva1, Judit Peix1, Yingbei Chen1, Analisa Di Feo1, Stijn Van Laarhoven1, Eric R. Lemmer1, Maria Isabel Fiel1, Swan N. Thung1, Steven Yeo1, Susan Roayaie1, Myron Schwartz1, John A. Martignetti1, Scott L. Friedman1, Josep M. Llovet1,2
1Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Liver Unit, Hospital Clinic, Barcelona, Spain
#641

**ACTIVATION OF THE WNT/B-CATENIN PATHWAY IN HEPATOCELLULAR CARCINOMA, AND IN VITRO GROWTH INHIBITION WITH A NOVEL SMALL MOLECULE ICG-001**

Pippa Newell1, Augusto Villanueva1, Derek Chiang4, Judit Peix1, Clara Alsina1, Stijn Van Laerhoven1, Swan N. Thung1, Maria Isabel Fiel1, Steven Yea1, Sasan Roayaie1, Myron Schwartz1, Michael Kahn3, Scott L. Friedman1, Josep M. Llovet1,2

1Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Liver Unit, Hospital Clinic, Barcelona, Spain. 3Center for Stem Cell and Regenerative Medicine, University of Southern California, Los Angeles, CA, USA. 4Dana-Farber Institute, MIT and Harvard University, Boston, MA, USA

#642

**CLOSE RELATIONSHIP BETWEEN CYTOKERATIN 19 EXPRESSION AND SIDE POPULATION PHENOTYPE DURING HUMAN HEPATOCELLULAR CARCINOGENESIS**

Yoh Zen1, Yasuni Nakanuma2

1Pathology, Kanazawa University Hospital, Kanazawa, Japan. 2Human Pathology, Kanazawa University Graduate School of Medicine, Kanazawa, Japan

#643

**THE INTRONIC P53 BINDING SITE IS ESSENTIAL FOR ACTIVATION OF THE CD95 GENE BY THE P53 FAMILY NETWORK**

Elisa Schulze Schleithoff1, Astrid Kairat1, Andreas Koch1, Tobias Schilling2, Min Li-Weber3, Peter H. Kramer3, Martina Müller1

1Internal Medicine IV, University of Heidelberg, Heidelberg, Germany. 2Internal Medicine I, University of Heidelberg, Heidelberg, Germany. 3Tumor Immunology Program, German Cancer Research Center (DKFZ), Heidelberg, Germany

#644

**EXPRESSION OF MULTIDRUG RESISTANCE-ASSOCIATED PROTEIN 1 IN HEPATOCELLULAR CARCINOMA IS ASSOCIATED WITH AGGRESSIVE TUMOR PHENOTYPE AND CAN REFLECT PROGENITOR CELL ORIGIN**

Sara Vander Borght1, Louis Libbrecht1, Mina Komuta1, Jacques Pineau5, Frederik Nevens3, Snorri S. Thorgeirsson4, Chris Verslype3, Tania Raskams1

1Morphology and Molecular Pathology, University Hospitals Leuven, Leuven, Belgium. 2Abdominal Surgery, University Hospitals Leuven, Leuven, Belgium. 3Hepatology, University Hospitals Leuven, Leuven, Belgium. 4Laboratory of Experimental carcinogenesis, National Cancer Institute, Bethesda, MD, USA

#645

**SELECTIVE HOMING OF ENDOTHELIAL PROGENITOR CELLS WITH CYTOSINE DEAMINASE CDN TO TUMOR TISSUES SUPPRESSES GROWTH OF HEPATOCELLULAR CARCINOMA BY 5'-FLUOROURACIL SECRETION**

Takiji Torimura1,2, Takato Ueno2,1, Kinya Inoue1,2, Eitaro Taniguchi1,3, Toru Nakamura1,2, Osamu Hashimoto1,2, Hironori Koga1,2, Hirohisa Yano1,2, Masamichi Kajiro1,2, Michio Sata1,2

1Medicine, division of Gastroenterology, Kurume university, Kurume city, Japan. 2Research Center for Innovative Cancer Therapy and Center of the 21st Century COE Program for Medical Science, Kurume university, Kurume city, Japan. 3Pathology, Kurume university, Kurume city, Japan

#646

**MAPK7 IDENTIFIED AS A PROBABLE TARGET FOR AMPLIFICATION AT 17P11 IN HEPATOCELLULAR CARCINOMA**

Keika Zen1, Kohihiroh Yasui1, Tomaoki Nakajima1, Yoshikazu Inagaki1, Shojo Mitsufuji1, Shintar Tanaka2, Masahito Minami1, Yoshiho Itoh1, Shigeki Arii1, Takeshi Okanoue1

1Molecular Gastroenterology and Hepatology, Graduate School of Medical Science, Kyoto Prefectural University of Medicine, Kyoto, Japan. 2Department of Hepato-biliary-pancreatic Surgery, Tokyo Medical and Dental University, Tokyo, Japan

#647

**NEIGHBOR OF PUNC E11 (NOPE): A NOVEL MARKER FOR MURINE HEPATOCELLULAR CARCINOMA**

Dirk Nierhoff1, Jens Margardt1, Maria J. Quasdorff1, Gisela Holz1, Bernd Arnold2, Ulrike Protzer3, Tobias Goeser1

1Department of Gastroenterology and Hepatology, University of Cologne, Cologne, Germany. 2Molecular Infectiology at the Center for Molecular Medicine, University of Cologne, Cologne, Germany. 3German Cancer Research Center, Heidelberg, Germany

#648

**HSP90 INHIBITION ABROGATES HUMAN HCC GROWTH THROUGH CDC2-MEDIATED G2/M CELL CYCLE ARREST**

Robin D. Kim, Go Watanabe, Kevin E. Behns

Surgery, University of Florida School of Medicine, Gainesville, FL, USA

#649

**LIVER SPECIFIC LDB1 DELETION RESULTS IN ENHANCED LIVER CANCER DEVELOPMENT**

Andreas Teufel1, Heiner Westphal2, Yangu Zhao2, Stephan Kanzler1, Peter R. Galle1

1Department of Medicine I, Johannes Gutenberg University, Mainz, Germany. 2National Institute of Child Health and Human Development, National Institutes of Health, Bethesda, MD, USA
#650
LIVER AND SPLEEN DENDRITIC CELL FUNCTION MODIFICATION DURING A MURINE MODEL OF HEPATOCARCINOGENESIS
Antonino Castellaneta, Nicola De Tullio, Francesca I. Gagliardi, Doriana Francioso, Michele Barone, Alfredo Di Leo, Antonio Francavilla
Department of Emergency and Organ Transplantation, University of Bari, Bari, Italy

#651
TARGETING HISTONE DEACETYLATION FOR TREATMENT OF HEPATOCellular CARCINOMA
Yun-Han Lee1, Hyun Goo Woo1, Itzhak Avital1,2, Adam D. Judge3, Marian Durkin1, Anita Toni1, Ju-Seog Lee4, Elizabeth A. Conner1, Valentina Factor1, Ian MacLachlan3, Snorri S. Thorgeirsson1
1Lab of Experimental Carcinogenesis, National Cancer Institute, NIH, Bethesda, MD, USA. 2Surgery Branch, National Cancer Institute, NIH, Bethesda, MD, USA. 3ProTiva Biotherapeutics, Inc., Burnaby, BC, Canada. 4Department of Systems Biology, UT MD Anderson Cancer Center, Houston, TX, USA

#652
ACTIVATION STATUS OF PI3K/AKT/MTOR PATHWAY IN HEPATOCellular CARCINOMA (HCC): ONCOGENIC ROLE AND CLINICAL IMPLICATIONS RICTOR (MTOR COMPLEX 2)
Augusto Villanueva1, Derek Y. Chiang2, Philippa Newell1, Judit Peix1, Yujin Hoshida2, Si Jin Van Laarhoven1, Swan N. Thung3, Sasar Roayaie4, Clara Alsinet5, Victoria Tovar5, M. Isabel Fiel3, Myron Schwartz4, Samuel Waxman1, Jordi Bruix5, Vincenzo Mazzaferro6, Todd R. Golub2, Scott L. Friedman1, Matthew Meyerson2, Josep M. Llovet1,5
1Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Human Genetics, Mount Sinai School of Medicine, New York, NY, USA. 3Pathology, Mount Sinai School of Medicine, New York, NY, USA. 4Surgical Oncology, Mount Sinai School of Medicine, New York, NY, USA. 5BCLC Group. Liver Unit, IDIBAPS. Hospital Clinic, Barcelona, Spain

#653
DECREASED INTRAHEPATIC CD8 TRAPPING IS ASSOCIATED WITH SUPPRESSION OF HEPATOCellular CARCINOMA: A ROLE FOR THE BETA GLYCOLIPID ACYL CHAIN LENGTH
Gadi Lalazar, Ami Ben Ya’acov, Menachem Hareati, Yaron Ilan
Liver Unit, Hadassah Hebrew University Medical Center, Jerusalem, Israel

#654
SUPPRESSION OF ALPHA-1,6 FUCOSYLTRANSFERASE INHIBITS INVASIVENESS OF HUMAN HEPATOCellular CARCINOMA CELLS
Takayuki Kogure, Yoshiyuki Ueno, Osamu Kimura, Tooru Shimosegawa
Division of Gastroenterology, Tohoku University Graduate School of Medicine, Sendai, Japan

#655
INDUCTION OF HEPATOMA-SPECIFIC IMMUNITY BY SUICIDE GENE THERAPY IN CC CHEMOKINE RECEPTOR (CCR) 1- OR CCR5-DEPENDENT MANNER
Noriko Iida1, Yasunari Nakamoto1, Kaheita Kakinoki1, Shuichi Kaneko1, Naofumi Mukaida2
1Department of Disease Control and Homeostasis, Graduate School of Medical Science, Kanazawa University, Kanazawa, Japan. 2Division of Molecular Bioregulation, Cancer Research Institute, Kanazawa University, Kanazawa, Japan

#656
MOLECULAR COMBINED THERAPY IN HEPATOCellular CARCINOMA (HCC) WITH AEE788 (EGFR/HER2/VEGFR INHIBITOR) AND RAD001, EVEROLIMUS (MTOR INHIBITOR): ANTINEOPLASTIC ACTIVITY IN A XENOGRAFT MODEL OF HCC
Augusto Villanueva3, Philippa Newell1, Judit Peix1, Analisa Di Feo3, Si Jin Van Laarhoven1, Swan Thung3, Fiel Isabel1, Steven Yea1, Sasar Roayaie4, Myron Schwartz3, John Martignetti2, Scott L. Friedman1, Josep M. Llovet1,5
1Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Human Genetics, Mount Sinai School of Medicine, New York, NY, USA. 3Pathology, Mount Sinai School of Medicine, New York, NY, USA. 4Surgical Oncology, Mount Sinai School of Medicine, New York, NY, USA. 5BCLC Group. Liver Unit, IDIBAPS. Hospital Clinic, Barcelona, Spain

#657
INTEGRATIVE GENOMIC CLASSIFICATION OF HEPATITIS C VIRUS POSITIVE HEPATOCellular CARCINOMAS
Derek Chiang1,2, Augusto Villanueva3, Judit Peix2, Philippa Newell3, Elisa Wurmbach3, Diana Donovan6, Rameen Beroukhim1,2, Gad Getz2, Sasar Roayaie4, Myron Schwartz3, Samuel Waxman3, Jordi Bruix5, Vincenzo Mazzaferro6, Scott L. Friedman2, Massimo Loda7,5, Azra Ligon6, Matthew Meyerson1,2, Josep M. Llovet1,5
1Department of Medical Oncology and Center for Cancer Genome Discovery, Dana-Farber Cancer Institute, Cambridge, MA, USA. 2Cancer Program, Broad Institute of MIT and Harvard, Cambridge, MA, USA. 3Pathology, Mount Sinai School of Medicine, New York, NY, USA. 4Surgical Oncology, Mount Sinai School of Medicine, New York, NY, USA. 5BCLC Group. Liver Unit, IDIBAPS. Hospital Clinic, Barcelona, Spain. 6Department of Pathology, Brigham and Women’s Hospital, Boston, MA, USA. 7Department of Pathology, Dana-Farber Cancer Institute, Boston, MA, USA

#658
EXPRESSION AND ROLE OF STEAROYL COENZYMIE A DESATURASE (SCD) IN HUMAN HCC
Samiksha Bansal2,1, Michael Berk2,1, Ariel E. Feldstein2,1
1Cleveland Clinic, Cleveland, OH, USA. 2Cell Biology, Cleveland Clinic, Cleveland, OH, USA
#659
KNOCKDOWN OF MIRNAS ENCODED BY THE POLYCIESTRON, Mir-17-92, CAUSES A PARTIAL REVERSION OF THE MALIGNANT PHENOTYPE OF HEPG2 CELLS
Erin Connolly, Tatjana Tchaikovskaya, Leslie E. Rogler, Charles E. Rogler
Medicine, Albert Einstein College of Medicine, Bronx, NY, USA

#660
ABROGATION OF CONSTITUTIVE STAT3 ACTIVITY SENSITIZES HUMAN HEPATOMA CELLS TO TRAIL-MEDIATED APOPTOSIS
Kazuhiro Nakao, Mariko Kusaba, Tatsuki Ichikawa, Hisamitsu Miyaki, Yusuke Motoyoshi, Hitota Shibata, Katsumi Eguchi
First Department of Internal Medicine, Nagasaki University School of Medicine, Nagasaki, Japan

Experimental Liver Transplantation and Liver Surgery

#661
HEPATOCYTE PROLIFERATIVE RESPONSE TO PARTIAL HEPATECTOMY IS MARKEDLY IMPAIRED IN TIRAP KNOCKOUT MICE
Hongdan Sun1, Romi Ghose2, Saul J. Karpen1, Sundararajah Thevanesan1
1Pediatrics-Gastroenterology, Hepatology & Nutrition, Texas Children’s Liver Center, Baylor College of Medicine, Houston, TX, USA. 2Department of Pharmaceutical and Pharmacological Sciences, University of Houston, Houston, TX, USA

#662
INTRACELLULAR INTERLEUKIN-2 IN CYTOTOXIC CD8+ T-LYMPHOCYTES CORRELATES TO THE BANFF SCORE DURING ACUTE ORGAN REJECTION IN LIVER TRANSPLANT RECIPIENTS
Bora Akoglu1,2, Susanne Kriener3, Stefan Zeuzem1, Dominik Faust2,1
1Hepatology, University Hospital Frankfurt, Frankfurt, Germany. 2Gastroenterology, Asklepios Clinic, Langen, Germany. 3Senckenberg Institute of Pathology, University Hospital Frankfurt, Frankfurt, Germany

#663
INCREASED MORTALITY IN MMP-9 KNOCKOUT MICE FOLLOWING 75-PERCENT PARTIAL HEPATECTOMY
Norifumi Ohashi, Naoki Shimojima, Justin H. Nguyen
Division of Transplant Surgery, Mayo Clinic College of Medicine, Jacksonville, FL, USA

#664
DOWN-REGULATION BY 1,25 DlHYDROXYVITAMIN D3 OF CD40L-INDUCED IMMUNOREGULATORY CYTOKINES PRODUCTION AND CO-STIMULATORY ACTIVITY IN MONOCYTE-MACROPHAGES FROM LIVER TRANSPLANT RECIPIENTS
Cristiana Almerighi1, Alberto Bergamini2, Raffaella Lionetti1, Anna Sinistro2, Simona Francioso1, Giuseppe Tisone3, Mario Angelico1
1Hepatology Unit, Tor Vergata University, Rome, Italy. 2Infectious Disease, Tor Vergata University, Rome, Italy. 3Transplant Surgery, Tor Vergata University, Rome, Italy

#665
PERIPHERAL BLOOD MONONUCLEAR CELLS GZB POSITIVE INCREASE AFTER THE FIRST WEEK FROM LIVER TX IN PATIENTS EXPERIENCING HCV RECURRENT
Alessandro Perrella, Giuseppe Arenga, Oreste Cuomo
Department of Laparoscopic, Hepatic Surgery and Liver Transplant Unit, AORN, A. Cardarelli Hospital, Naples, Italy, Naples, Italy

#666
HEPATITIS C VIRUS COULD BE ERADICATED WITH STRONG IMMUNE RESPONSES AFTER WITHDRAWING INTERFERON TREATMENT POST LIVING DONOR LIVER TRANSPLANTATION
Akinobu Takaki1, Takahito Yagi2, Yoshiaki Iwasaki1, Hiroshi Sadamori2, Kazuko Koike1, Masashi Tatsukawa1, Haruhiko Kobashi1, Kohsaku Sakaguchi1
1Gastroenterology, Okayama University, Okayama, Japan. 2Gastroenterological surgery, transplant and surgical oncology, Okayama University, Okayama, Japan

#667
ISCHEMIC PRECONDITIONING INCREASES Mn-SUPEROXIDE DISMUTASE AND PREVENTS FREE RADICAL-DEPENDENT MITOCHONDRIAL DEPOLARIZATION IN SMALL-FOR-SIZE LIVER GRAFTS
Hasibur Rehman1, Henry D. Conner2, Venkat K. Ramshesh1, Tom Theruvath1, Ronald P. Mason3, John J. Lemasters1, Zhi Zhong1
1Pharmaceutical Sciences, Medical University of South Carolina, Charleston, SC, USA. 2Biochemistry & Molecular Biology, Medical University of South Carolina, Charleston, SC, USA. 3Laboratory of Pharmacology and Chemistry, NIEHS, RTP, NC, USA

#668
ADENOVIRAL GENE DELIVERY OF INTERLEUKIN-10 REDUCES HEPATIC ISCHEMIA-REPERFUSION INJURY IN RATS THRU INHIBITION OF KUPFFER CELL ACTIVATION
Matthias Froh, Peter Walbrun, Susanne Netter, Reiner Wiest, Juergen Schoelmerich, Claus Hellerbrand
Internal Medicine I, University of Regensburg, Regensburg, Germany
#669

**URIDINE-5’-TRIPHOSPHATE (UTP) PROTECTS AGAINST HEPATIC ISCHEMIC INJURY IN MICE**

Ziv Ben-Ari1, Ori Pappo2, Smadar Yitzhaki3, Yelena Cheporko4, Asher Shainberg5, Eytan Mor5, Edith Hochhauser4
1Liver Institute, Rabin Medical Center, Petah-Tiqva, Israel. 2Department of Histopathology, Rabin Medical Center, Petah-Tiqva, Israel. 3Faculty of Life Sciences, Bar-Ilan University, Ramat Gan, Israel. 4Cardiac and Liver Research Laboratory, Felsenstein Medical Research Center, Petah-Tiqva, Israel. 5Department of Transplantation, Rabin Medical Center, Petah-Tiqva, Israel

#670

**INTRAHEPATIC COMPLEMENT ACTIVATION, SINUSOIDAL ENDOTHELIAL INJURY AND LACTIC ACIDOSIS IS ASSOCIATED WITH INITIAL POOR FUNCTION OF THE LIVER POST TRANSPLANTATION**

Michael A. Silva, Darius F. Mirza, Nick Murphy, Douglas A. Richards, Stephen J. Wigmore, John A. Buckels, Desley A. Neil
The Liver Unit, University Hospital Birmingham NHS Trust - Queen Elizabeth, Birmingham, United Kingdom

#671

**INTERMITTENT REPERFUSION STRESS ACCELERATES LIVER REGENERATION BY INDUCING ENTRY AND PROGRESSION IN CELL CYCLE OF HEPATOCYTES**

Sasse-Fanie Mbatchi1, Hélène Duval1, Stéphane Grandadam1,2, Catherine Ribault1, Claire Piquet-Pellorce1, Pascal Loyer1, Christine Guguen-Guillouzo1, Anne Corlu1, Karim Boudjema1,2
1INSERM U522, INSERM, Rennes, France. 2Département de Chirurgie Viscérale, Hôpital Pontchaillou, Rennes, France

#672

**OXIDATIVE DAMAGE TO MITOCHONDRIAL DNA AND PROTEINS IN SMALL-FOR-SIZE LIVER GRAFTS**

Zhi Zhong1, Hasibur Rehman1, Tom Theruvath1, John J. Lemas ters1,2
1Pharmaceutical Sciences, Medical University of South Carolina, Charleston, SC, USA. 2Biochemistry & Molecular Biology, Medical University of South Carolina, Charleston, SC, USA

#673

**ALTERNATIVE PRECONDITIONING WITH DEATH LIGANDS TNF-α & FASL PROTECTS THE CIRRHOTIC MOUSE LIVER AGAINST ISCHEMIC INJURY**

Jae-Hwi Jang, Wolfgang Moritz, Rolf Graf, Pierre A. Clavien
Visceral and Transplantation Surgery, University Hospital Zürich, Zürich, Switzerland

#674

**P66SHC, AN AGEING PROTEIN, PLAYS A PIVOTAL ROLE IN POST-HEPATECTOMIZED LIVER REGENERATION IN AGED MICE**

Michitaka Ozaki1, Sanae Haga2, Tadahiro Osada2, Yuko Oikawa1, Hiroyuki Furukawa3, Kaikobd Irani4, Satoru Todo2
1Department of Molecular Surgery, Hokkaido University SOM, Sapporo, Japan. 2Department of Surgery, Hokkaido University SOM, Sapporo, Japan. 3Department of Organ Transplantation and Regenerative Medicine, Hokkaido University SOM, Sapporo, Japan. 4Cardiovascular Institute, University of Pittsburgh Medical Center, Pittsburgh, PA, USA

#675

**METHOXYPOLYETHYLENE GLYCOL MODIFIED-ALBUMIN (PEG-ALB) ENHANCED THE COLD PRESERVATION PROPERTIES OF UW SOLUTION IN RAT LIVER GRAFTS**

Rime Abbas1, David Dingam2, Deepak Malholtra2, Henry Brunengraber2, Juan R. Sanabria1
1Surgery, University Hospitals Case Medical Center, Cleveland, OH, USA. 2Medicine, University of Toledo Medical Center, Toledo, OH, USA

**#704**

**PROGRESSION IN PBC: NEW INSIGHTS FROM FOLLOW-UP LIVER BIOPSIES 10 YEARS AFTER DIAGNOSIS**

Teru Kugami1, Rupert Abdal1, Maha Guindi2, E. Jenny Heathcote1

1Gastroenterology, Toronto Western Hospital / University of Toronto, Toronto, ON, Canada. 2Pathology, Toronto General Hospital / University of Toronto, Toronto, ON, Canada
#705
RITUXIMAB FOR PRIMARY BILIARY CIRRHOSIS (PBC) REFRACTORY TO URSEDOXOXYCHOLIC ACID (UDCA)

Robert P. Myers, Abdel Aziz Shaheen, Mark Gordon Swain, Samuel S. Lee, Shirley Cole, Shauna Coffey-Williamson, Kelly W. Burak
Liver Unit, Department of Medicine, University of Calgary, Calgary, AB, Canada

#706
BILIARY INFECTION WITH MOUSE MAMMARY TUMOR VIRUS IN THE NOD.C3C4 MOUSE AND OTHER MOUSE MODELS OF PRIMARY BILIARY CIRRHOSIS

Min Chen1, Don Graham1, Guangzhi Zhang1, Shawn Wasilenko1, Chelsea McDougall1, Mark Kenteman1, Michael Sakalian1, William M. Ridgway3, Richard A. Flavell4, Andrew L. Mason1
1Division of Gastroenterology, University of Alberta, Edmonton, AB, Canada. 2Division of Gastroenterology, University of Alberta, Edmonton, AB, Canada. 3Microbiology and Immunology, University of Oklahoma Health Sciences Center, Oklahoma, OK, USA. 4Division of Rheumatology and Immunology, University of Pittsburgh School of Medicine, Pittsburgh, PA, USA.

#707
INCIDENCE AND MORTALITY OF PRIMARY SCLEROSING CHOLANGITIS IN THE UK: A POPULATION-BASED COHORT STUDY

Timothy R. Card, Masoud Solaymani-Dodaran, Joe West Department of Epidemiology ans Public Health, University of Nottingham, Nottingham, United Kingdom

#708
STIMULATION OF THE INNATE IMMUNE SYSTEM IS NECESSARY FOR LIVER-SPECIFIC CD8+ T LYMPHOCYTES TO INDUCE AN AUTOIMMUNE HEPATITIS

Kathie Béland1, Pascal Lapierre1,3, Fernando Alvarez1,2
1Gastroenterology, hepatology and nutrition division, CHU Sainte-Justine, Montreal, QC, Canada. 2Department of Biomedical Sciences, University of Montreal, Montreal, QC, Canada. 3Department of Pediatrics, University of Montreal, Montreal, QC, Canada

#709
CLINICAL RELEVANCE OF GENETIC AND SEROLOGIC MARKERS IN AUTOIMMUNE HEPATITIS: A SINGLE CENTER EXPERIENCE WITH 296 PATIENTS

Frauke Metzler, Eyk Heinrich, Christian P. Strassburg, Michael P. Manns, Arndt Vogel
Gastroenterology and Hepatology, Medical School Hannover, Hannover, Germany

#710
PERIPHERAL, BUT NOT CENTRAL, TOLERANCE NOR LEVEL OF AUTOANTIGEN EXPRESSION IS RESPONSIBLE FOR THE GENDER BIAS IN SUSCEPTIBILITY TO EXPERIMENTAL TYPE 2 AUTOIMMUNE HEPATITIS

Pascal Lapierre1,2, Kathie Béland1, Fernando Alvarez1,3
1Gastroenterology, hepatology and nutrition division, CHU Sainte-Justine, Montreal, QC, Canada. 2Department of Biomedical Sciences, University of Montreal, Montreal, QC, Canada. 3Department of Pediatrics, University of Montreal, Montreal, QC, Canada

#711
PREDICTIVE FACTORS FOR HEPATOCELLULAR CARCINOMA IN TYPE 1 AUTOIMMUNE HEPATITIS: IMPACT OF GENDER, STAGE, HLA PHENOTYPE AND TREATMENT

Aldo J. Montano-Loza1, Herschel A. Carpenter2, Albert J. Czaja1
1Medicine, Mayo Clinic College of Medicine, Rochester, MN, USA. 2Laboratory Medicine and Pathology, Mayo Clinic College of Medicine, Rochester, MN, USA

#712
GLUCOCORTICOID RESISTANCE IN AUTOIMMUNE HEPATITIS ASSOCIATES TO INCREASED EXPRESSION AND ACTIVITY OF P-GLYCOPROTEIN IN T CELL

Hiroki Takahashi, Masanori Nakano, Shigeo Tamaki, Yushi Kuniyasu, Mikio Zeniya
Gastroenterology and Hepatology, Department of Internal Medicine, JIKEI University School of Medicine, Tokyo, Japan

#713
POTENTIATION OF THE INHIBITORY EFFECT OF INTRAHEPATIC NKT LYMPHOCYTES BY A NOVEL NON-DEGRADABLE BETA-GLUCOSYLCERAMIDE ANALOG IS ASSOCIATED WITH DECREASED STAT 1 PHOSPHORYLATION

Gadi Lalazar1, Ami Ben Ya’acov1, Madi El-Haj1, Dan M. Livovskiy1, Orit Pappo2, Gunter Schwartzman3, Yaron Ilan1
1Liver Unit, Hadassah Hebrew University Medical Center, Jerusalem, Israel. 2Pathology, Hadassah Hebrew University Medical Center, Jerusalem, Israel. 3Institut fur Organische chemie und Biochemie, University of Bonn, Bonn, Germany

#714
ASSOCIATION OF CYTOTOXIC T-LYMPHOCYTE ANTIGEN 4 GENE POLYMORPHISMS WITH TYPE 1 AUTOIMMUNE HEPATITIS IN JAPANESE

Takeji Umemura1, Masao Ota2, Kaname Yoshizawa1, Yoshihiro Katsuyama3, Satoru Joshita1, Tetsuya Ichijo1, Eiji Tanaka1, Shigeyuki Kawa4, Kendo Kiyosawa1
1Internal Medicine, Shinshu University School of Medicine, Matsumoto, Japan. 2Legal Medicine, Shinshu University School of Medicine, Matsumoto, Japan. 3Pharmacy, Shinshu University School of Medicine, Matsumoto, Japan. 4Center for Health, Safety and Environmental Management, Shinshu University, Matsumoto, Japan
#715
OUTCOME AND SURVIVAL IN CHILDHOOD ONSET AUTOIMMUNE SCHELOSING CHOLANGITIS AND AUTOIMMUNE HEPATITIS; A 13 YEARS FOLLOW-UP STUDY
Astrid Scalori, Michael A. Heneghan, Nedim D. Hadzic, Diego Vergani, Giorgina Mieli-Vergani
King’s College Hospital, London, United Kingdom

#716
GENETICALLY DETERMINED ABNORMALITY OF THE PD-1/PD-LS PATHWAY MAY PREDISPOSE TO AUTOIMMUNE LIVER DISEASE
Pengyun Wang, Maria Serena Longhi, Giorgina Mieli-Vergani, Diego Vergani, Yun Ma
Institute of Liver Studies, King’s College London School of Medicine at King’s College Hospital, London, United Kingdom

#717
THE USE OF MYCOPHENOLATE MOFETIL IN THE TREATMENT OF AUTOIMMUNE HEPATITIS IN PATIENTS REFRACTORY TO OR INTOLERANT OF CONVENTIONAL TREATMENT
Kaveh Sharzehi, Kimberly Brown, Mary Ann H. Sherbondy
Henry Ford Hospital, Detroit, MI, USA

#718
LYMPHOTOXIN ALPHA GENE POLYMORPHISMS IN PEDIATRIC AUTOIMMUNE HEPATITIS TYPE 1
Gilda Porta1, L. C. Oliveira3, R. Ramasawmy4, P. L. Bittencourt5, I. K. Miura1, R. S. Pugliese1, V. B. Danesi1, J. Kalil4, A. C. Goldberg2

\( \beta \)-CATENIN ACTIVATION IS CRITICAL FOR HEPATIC REGENERATION AFTER ACUTE LIVER FAILURE
Udayan Apte1, Gang Zeng1, Benjamin Cieply1, Klaus Kaestner2, Sattarshar P. Monga1
1Department of Pathology, University of Pittsburgh School of Medicine, Pittsburgh, PA, USA. 2Genetics, University of Pennsylvania School of Medicine, Philadelphia, PA, USA

#862
CEREBRAL BLOOD FLOW AUTOREGULATION IN EXPERIMENTAL LIVER FAILURE
Thomas J. Dethloff1, Gitte M. Knudsen2, Fin Stolze Larsen1
1Dept Hepatology, afd. 2.12.1, Copenhagen University Hospital Rigshospitalet, Denmark, Copenhagen Ø, Denmark. 2The Neurobiology Research Unit, Copenhagen University Hospital Rigshospitalet, Copenhagen, Denmark

#863
AN HLA-DR EXPRESSING MONOCYTE INFILTRATE AND AN ABUNDANCE OF IL-10 TRANSCRIPTS CHARACTERIZE THE LIVER OF ACUTE LIVER FAILURE
Charalambos G. Antoniades, Philip A. Berry, Munther Hussain, Maria Serena Longhi, Alberto Quaglia, Julia Wendon, Diego Vergani
King’s College Hospital, Institute of Liver Studies, London, United Kingdom

#864
DEVELOPMENT OF A NOVEL MODEL OF ACUTE LIVER FAILURE IN XENOTOLERANT NOD-SCID MICE FOR STUDYING THERAPEUTIC INTERVENTIONS
Ekaterine Berishvili, Brigid Joseph, Sriram Bandi, Rohit Singhania, Yao-Ming Wu, Sanjeev Gupta
Marion Bessin Liver Research Center, Albert Einstein College of Medicine, Bronx, NY, USA

#865
PRECLINICAL ASSESSMENT OF HEPAHOPE BIOARTIFICIAL LIVER SYSTEM
Sung-Soo Park1, Yoon-Kyong Yang1, Young-Tm Lee1, Jaeho Jung1, Delai Zhao1, Young Park1, Hyoungyoon Yoon1, Jun-Seok Park1, Jennifer Tam1, Chintya Ganda1, Hyung-Taek Lee1, Sunny Yang1, Charles Gropper1, Robert G. Gish2, Brendan McGuire3, Angela Panoskalis-Mortari4, Dong Jin Suh5, Han Chu Lee6, James Ferguson6
1HepaHope, Irvine, CA, USA. 2California Pacific Medical Center, SanFrancisco, CA, USA. 3University of Alabama, Tuscaloosa, AL, USA. 4University of Minnesota, Minneapolis, MN, USA. 5University of Ulsan, Seoul, South Korea. 6ISIS services, Berkeley, CA, USA

Denotes AASLD Presidential Poster of Distinction
#866
ACTIN FREE GC GLOBULIN: A RELIABLE MARKER OF OUTCOME IN ACUTE AND ACUTE ON CHRONIC LIVER FAILURE
Andrew J. Portal, Matthew Bruce, Mark Austin, Constantine J. Karvellas, Mark McPhail, Elizabeth Sizer, Georg Auzinger, Julia Wendon, William Bernal
Institute of Liver Studies, Kings College Hospital, London, United Kingdom

#867
INTEGRATED METABONOMIC INVESTIGATION IN THE MODEL OF LIVER INJURY AND REGENERATION INDUCED BY CCL4 IN RATS
Athina Zira1,2, Stamatos E. Theocharis1, Soren Engelsen3, Ioannis Stamos1, Ioanna Andreadou2, Emmanuel Mikros2
1Department of Forensic Medicine and Toxicology, Medical School, National and Kapodistrian University of Athens, Athens, Greece. 2Department of Pharmaceutical Chemistry, School of Pharmacy, National and Kapodistrian University of Athens, Athens, Greece. 3Department of Dairy and Food Sciences, Royal Veterinary and Agricultural University of Copenhagen, Copenhagen, Denmark

#868
ANATOMICAL LOCATION OF ACUTE LIVER INJURY DETERMINES THE BONE MARROW RESPONSE TO LIVER INJURY
Eleanor S. Gilchrist1, Catherine Payne1, Kay Samuel2, Patricia Lee1, Philip N. Newsome1, John Plevris1
1Hepatology, University of Edinburgh, Edinburgh, United Kingdom. 2John Hughes Bennett Laboratories, University of Edinburgh, Edinburgh, United Kingdom

#869
RENAL FAILURE IN ACUTE AND ACUTE ON CHRONIC LIVER FAILURE: A ROLE FOR NOVEL RENAL BIOMARKERS?
Andrew J. Portal1, Mark Austin1, Matthew Bruce1, Constantine J. Karvellas1, Funmi Awopetu2, Roy Sherwood2, Elizabeth Sizer1, William Bernal1, Georg Auzinger1, Michael Heneghan1, Julia Wendon1
1Institute of Liver Studies, Kings College Hospital, London, United Kingdom. 2Department of Biochemistry, Kings College Hospital, London, United Kingdom

#871
THE RATIO OF COMPUTED TOMOGRAPHY- DERIVED LIVER VOLUME / STANDARDIZED LIVER VOLUME IS A USEFUL PROGNOSTIC FACTOR OF ADULT ACUTE LIVER FAILURE
Yoshiyuki Yamagishi, Hidetsugu Saito, Shinichiro Tada, Hirotsoshi Ebinuma, Masahiro Kikuchi, Yoshinori Horie, Shinzo Kato, Toshifumi Hibi
Division of Gastroenterology & Hepatology, Department of Internal Medicine, School of Medicine, Keio University, Tokyo, Japan

HCV: Epidemiology

#872
A NEW GENOTYPE OF HEPATITIS C VIRUS ORIGINATING FROM CENTRAL AFRICA
Donald Murphy1, Jasmine Chamberland1, Raymond Dandavino2, Erwin Sablon3
1Laboratoire de santé publique du Québec, Institut national de santé publique du Québec, Sainte-Anne-de-Bellevue, QC, Canada. 2Service de néphrologie, Hôpital Maisonneuve-Rosemont, Montréal, QC, Canada. 3Infectious Diseases Unit, Innogenetics, Ghent, Belgium

#873
OUTBREAK OF A NEW HEPATITIS C VIRUS SUBTYPE (SUBTYPE 1M) IN A HEMODIALYSIS UNIT
Stephane Chevaliez1, Rozenn Brillet1, Jean Sehonou2, Laetitia Barbotte1, Jean-Michel Pawlotsky1
1Henri Mondor Hospital, University of Paris 12, Creteil, France. 2Hubert Kutuku Maga Hospital, Cotonou, Benin

#874
HEPATITIS C VIRUS RNA IS DETECTED IN CERVICOVAGINAL FLUIDS OF MENSTRUATING WOMEN, IN A MENOPAUSAL WOMAN WITH BLOODY CERVICOVAGINAL FLUID, BUT NOT IN WOMEN WHO HAVE HAD HYSTERECTOMY
Chia C. Wang1, Linda Cook2, Sarah Holte1, Meighan Krows1, Arthur Bagabag2, Kaying Ng2, Keith Jerome1,2, Lawrence Corey1,2
1Medicine, University of Washington, Seattle, WA, USA. 2Virology, Fred Hutchinson Cancer Research Center, Seattle, WA, USA

#875
HEPATITIS C TESTING, CARE AND TREATMENT: EVOLUTION OVER TEN YEARS IN FRANCE
Christine Meffre1, Elisabeth Delarocque-Astagneau1, Corinne Pioche1, Frédéric Dubois1, Françoise Roudot-Thoraval1, Dominique Guyader1, Christine Silvain1, Yann Le Strat1, Jean Claude Desenclos1

#1028
HCV-SPECIFIC CELLULAR RESPONSES IN ANTIBODY NEGATIVE, HCV RNA NEGATIVE INJECTION DRUG USERS
Marija Zeremski, Queenie B. Brown, Marla A. Shu, Brian R. Edlin, Andrew Talal
Division of Gastroenterology, Department of Medicine, Center for the Study of Hepatitis C, Weill Medical College of Cornell University, New York, NY, USA

#1029
DETECTION OF CD4+ T CELL RESPONSES IN PATIENTS WITH ACUTE HCV INFECTION IRRESPECTIVE OF CLINICAL OUTCOME
Julian C. Schulze zur Wiesch1,2, Victoria Kasprowicz2, Arthur Y. Kim2, Steve Longworth2, Brian Nolan2, Thomas Kuntzen2, Barbara McGovern2, Lia Lewis-Ximenas6,2, Raymond T. Chung3, William Kwock4, Bruce D. Walker2,7, Georg M. Lauer2
1Medizinische Klinik I, Universitätsklinikum Hamburg Eppendorf, Hamburg, Germany. 2Partners Aids Research Center, Massachusetts General Hospital, Boston, MA, USA. 3Gastrointestinal Unit, Massachusetts General Hospital, Boston, MA, USA. 4Benaroya Research Institute, Seattle, WA, USA. 5Lemuul Shattuck Hospital, Boston, MA, USA. 6Instituto Oswaldo Cruz, Rio de Janeiro, MA, USA. 7Howard Hughes Medical Institute, Chevy Chase, MD, USA

#1030
CHRONIC EVOLUTION OF ACUTE HEPATITIS C IS ASSOCIATED WITH LOWER FREQUENCIES OF HCV-SPECIFIC CD4+ T-CELLS BUT UNRELATED TO HCV-SPECIFIC FOXP3+ REGULATORY CD4+ T-CELLS
Malte H. Heeg1,2, Axel Ulsenheimer1,2, Norbert H. Gruener1,2, Maria C. Jung1,2, Reinhard Zachoval1,2, Winfried Schraut2, Martin Waechtler2, Gerold Pape1,2, Herlmut M. Diepolder1,2
1Dept. of Medicine II, LMU-Munich, Munich, Germany. 2Dept. of Immunology, LMU Munich, Munich, Germany. 3Hospital Munich-Schwabing, Munich, Germany

#1031
HIGHER PERCENTAGES OF INTRA-HEPATIC REGULATORY T CELLS ARE PRESENT IN CHRONIC HEPATITIS B PATIENTS WITH A HIGH VIRAL LOAD
Jeroen N. Stoop1, Andrea M. Woltman1, Rekha S. Bind1, Johannes G. Kusters1, Pieter E. Zandervan1, Ernest J. Kuipers1, Harry L. Janssen1, Renate G. van der Molen1
1Gastroenterology & Hepatology, Erasmus MC, University Medical Center Rotterdam, Rotterdam, Netherlands. 2Pathology, Erasmus MC, University Medical Center Rotterdam, Rotterdam, Netherlands

#1032
ANTIGEN-PULSED DENDRITIC CELLS ARE CAPABLE OF INDUCING BOTH INNATE AND ADAPTIVE IMMUNITY: A LESION LEARNT FROM CROSS TALK BETWEEN NATURAL KILLER CELLS AND DENDRITIC CELLS AND THEIR APPLICATION FOR IMMUNE THERAPY OF CHRONIC HEPATITIS B VIRUS INFECTION
Osamu Yoshida, Sh. Md. Fazle Akbar, Teruki Miyake, Mao Hamada, Yoichi Hiasa, Kojiro Michitaka, Morikazu Onji
Department of Gastroenterology and Metabolism, Ehime University Graduate School of Medicine, Toon, Japan

#1033
HLA CLASS II AND RACE-DEPENDENT DIFFERENCES IN IMMUNE RESPONSE TO HCV, SUSCEPTIBILITY TO CHRONIC INFECTION, AND RESPONSE TO THERAPY
Tony N. Marion1, Yanming Xing1, Zhimin Liu1, Ann Madey2, Jacqueline F. Fleckenstein2
1Molecular Sciences, University of Tennessee Health Science Center, Memphis, TN, USA. 2Medicine-Gastroenterology, University of Tennessee Health Science Center, Memphis, TN, USA

#1034
ADHESION OF IN VITRO GENERATE DENDRITIC CELLS TO HUMAN HEPATIC ENDOTHELIUM UNDER CONDITIONS OF SHEAR STRESS
Stuart Curbishley, Janine Youster, Vincent W K Lai, David H. Adams
Liver Research Group, Queen Elizabeth Hospital, University of Birmingham, Birmingham, United Kingdom

#1035
INTRAHEPATIC REGULATORY T CELLS DIFFER PHENOTYPICALLY FROM THEIR CIRCULATING COUNTERPARTS IN CHRONIC THERAPY NAIVE HCV PATIENTS
Mark Claassen, Rob J. de Knegt, Harry L. Janssen, Andre Boomstra
Laboratory of Gastroenterology and Hepatology, Erasmus MC - University Medical Centre Rotterdam, Rotterdam, Netherlands

#1036
THE ROLE OF NANOBACTERIA IN CHOLECYSTITIS AND CHOLELITHIASIS
Somaia Shehab Elddeen, Linda K. Green, Vladimir Kharoustov, Boris Yoffe
Department of Medicine, Michael E. DeBakey VAMC, Baylor College of Medicine, Houston, TX, USA
#1037
CRITICAL ROLE OF CD44 IN HEPATOTOXIN-MEDIATED LIVER INJURY
Kiminori Kimura1,2, Masahito Nagaki2, Kazuhiro Kakimi1, Hisatake Moriwaki2
1Department of Immunotherapeutics, The University of Tokyo, Bunkyo-ku, Japan. 2First Department of Internal Medicine, Gifu University School of Medicine, Gifu-shi, Japan

#1038
INCREASED ACETYLATION OF ALPHA-TUBULIN AND DECREASED EXPRESSION OF FIBROCYSTIN ARE SENSITIVE MARKERS OF CELLULAR DAMAGE AND ACTIVATION IN INFLAMMATORY LIVER DISEASE
Sarah Blair-Reid1, Gary Reynolds1, Jane Hartley3, Deirdre A. Kelly2, Stefan Hubscher2, Peter C. Harris5, Colin A. Johnson4, Christopher J. Ward5, Simon Afford1
1Liver Research Group, University of Birmingham, Birmingham, United Kingdom. 2Pathology, University of Birmingham, Birmingham, United Kingdom. 3Paediatrics and Child Health, The Children’s Hospital, Birmingham, United Kingdom. 4The Leeds Institute of Molecular Medicine, Leeds, United Kingdom. 5Division of Nephrology, The Mayo Clinic, Rochester, MN, USA

#1039
CRITICAL ROLE OF EARLY GROWTH RESPONSE-1 TO GALACTOSAMINE / LIPOPOLYSACCHARIDE-INDUCED ACUTE LIVER INJURY IN MICE
Michele T. Pritchard1, Sanjoy Roychowdhury1, Megan R. McMullen1, Laping Guo2, Gavin E. Arteel2, Laura Nagy1
1Pathobiology, Cleveland Clinic, Cleveland, OH, USA. 2Pharmacology and Toxicology, University of Kentucky health Sciences Center, Louisville, KY, USA

#1040
INHIBITION OF THE KUPFFER CELL INCREASED SERUM HMGB1 LEVELS AND THE MORTALITY IN A RAT SEPTIC PERITONITIS MODEL
Hiroshi Kono, Kenichi Ishii, Naohiro Hosomura, Nobuyuki Tanaka, Masanori Matsuda, Hideki Fuji
First Department of Surgery, University of Yamanashi, Chuo, Japan

#1041
MRNA EXPRESSION ANALYSIS OF IMMUNOREGULATION, APOPTOSIS AND FIBROSIS IN LIVER DISEASES
Georgios Germanidis1,3, Gedeon Loules1, Ioannis Kouvelis2, Vaios Karanikas1, Eleutherios Giannoulis2, Konstantinos Ritis3, Anastasios Germanis1, Mathaios Speletas1
1Immunology and Histocompatibility,University Hospital of Larissa,Thessaly Medical School, Larissa, Greece. 2First Dept.of Internal Medicine, Aristotle University of Thessaloniki,AHEPA Hospital, Thessaloniki, Greece. 3First Department of Internal Medicine, Democritus University of Thrace, Alexandroupolis, Greece

#1042
EXPRESSION OF NOTCH SIGNALING AND ANTIGEN PROCESSING MOLECULES IN PROGRESSIVE PATHOGENENIC BIOPSIES OF CHRONIC HEPATITIS B INFECTION
Nirupma T. Pati, Sujoy Bose, Sukriti Baveja, Hisar Syed, Shiv K. Sarin
Gastroenterology, G B Pant Hospital, New Delhi, India

Moderator: Liver Fibrogenesis

#1043
INTRAHEPATIC STATUS OF REGULATORY T CELLS IN AUTOIMMUNE HEPATITIS, PRIMARY BILIARY CIRRHOSIS, CHRONIC HEPATITIS C, AND CHRONIC HEPATITIS B
Masashi Sakaki1, Kazumasa Hiroishi1, Toshiyuki Baba1, Miki Kushima2, Michio Imawari1
1Second Department of Internal Medicine, Showa University School of Medicine, Tokyo, Japan. 2Division of Hospital Pathology, Showa University School of Medicine, Tokyo, Japan

#1044
SPECIFIC CONTRIBUTION OF NADPH-OXIDASE IN DISTINCT CELL TYPES DURING HEPATIC FIBROSIS.
Samuele De Minicis1, Ekihiro Seki1, Christoph Osterreicher1, Robert F. Schwabe2, David Brenner1
1Department of Medicine, University of California, San Diego, School of Medicine, La Jolla, CA, USA. 2Department of Medicine, Columbia University, New York, NY, USA

#1045
TLR4/MYD88/NF-KB-MEDIATES HEPATIC STELLATE CELLS ACTIVATION BY THE REGULATION OF TGF-B PSEUDORECEPTOR BAMBI IN HEPATIC FIBROSIS
Ekihiro Seki1, Samuele De Minicis1, David A. Brenner1, Robert F. Schwabe2
1Medicine, University of California, San Diego, School of Medicine, La Jolla, CA, USA. 2Medicine, Columbia University, College of Physicians and Surgeons, New York, NY, USA

#1046
GLYCATED FIBRONECTIN STIMULATES HEPATIC STELLATE CELL (HSC) ACTIVATION AND TYPE I COLLAGEN PRODUCTION IN PRIMARY CULTURES
Milan Dodig, Min Li, Srinivasan Dasarathy, Arthur J. McCullough Department of Gastroenterology and hepatology, Cleveland Clinic Foundation and Lerner College of Medicine, Cleveland, OH, USA

#1047
BENEFICIAL EFFECT OF ANGIOTENSIN-BLOCKING AGENTS ON LIVER FIBROSIS IN PATIENTS WITH HEPATITIS C
Nirali Shah1, Hui Zheng2, Joseph Misraji3, Raymond T. Chung2
1Departments of Internal Medicine and Pediatrics, Massachusetts General Hospital, Boston, MA, USA. 2Gastroenterology Unit, Department of Medicine, Massachusetts General Hospital, Boston, MA, USA. 3Biostatistics, Department of Medicine, Massachusetts General Hospital, Boston, MA, USA. 4Department of Pathology, Massachusetts General Hospital, Boston, MA, USA
#1048
ROLE OF P75 SIGNALLING IN THE PATHOGENESIS OF LIVER FIBROSIS IS CONTEXT AND LIGAND STRUCTURE DEPENDENT

Timothy J. Kendall1, R Christopher Benyon1, John Iredale2
1Liver Group, University of Southampton, Southampton, United Kingdom. 2MRC Centre for Inflammation Research, University of Edinburgh, Edinburgh, United Kingdom

#1049
LIVER FIBROSIS PERSISTS FOLLOWING NEUTROPHIL DEPLETION DURING LIVER REPAIR

Mark Harty1, Elaine F. Papa1, Grant A. Ramm2, Stephen H. Gregory3, Thomas F. Tracy4
1Surgery, The Warren Alpert Medical School of Brown University, Providence, RI, USA. 2The Hepatic Fibrosis Group, The Queensland Institute of Medical Research, Brisbane, QLD, Australia. 3Medicine, The Warren Alpert Medical School of Brown University, Providence, RI, USA. 4Surgery and Pediatrics, The Warren Alpert Medical School of Brown University, Providence, RI, USA

#1050
EVIDENCE OF SNAIL1 TRANSCRIPTION FACTOR INVOLVEMENT IN HEPATIC STELLATE CELLS ACTIVATION PROCESS

Melania Scarpa1,2, Alessia Grillo1,2, Paola Brun1,2, Federica Ditadi1, Giorgio Palù1, Ignazio Castagliuolo1, Diego Martines2
1Histology, Microbiology and Medical Biotechnologies, University of Padova, Padova, Italy. 2Surgical and Gastroenterological Sciences, University of Padova, Padova, Italy

#1051
INCREASED MORTALITY, ENHANCED LIVER FIBROSIS AND DIMINISHED ACUTE-PHASE RESPONSE AFTER BILE-DUCT LIGATION IN HEPATOCYTE SPECIFIC C-MET/GP130 DEFICIENT MICE

Arne Giebeler1, Nikolaus Gassler2, Malgazorta Borowiak5, Carmen Birnmeier3, Christian Trautwein3, Konrad L. Streetz1
1Department of Medicine 3, University Hospital Aachen, Aachen, Germany. 2Department of Pathology, University Hospital, Aachen, Germany. 3Developmental Biology/Signal Transduction, Max-Delbrueck-Center, Berlin, Germany. 4Angiogenesis and Cardiovascular Pathology, Max-Delbrueck-Center, Berlin, Germany. 5Department of Molecular and Cellular Biology Howard Hughes Medical Institute, Harvard University, Cambridge, MA, USA

#1052
AMELIORATION OF BILIARY FIBROSIS BY AN ALPHAVBETA 6 INTEGRIN ANTAGONIST IS MEDIATED BY INHIBITION OF CHOLANGIOCYTE ADHESION TO FIBRONECtin AND CHOLANGIOCYTE TGFbeta1 ACTIVATION

Eleonora Patenkera1, Yury Popovb2, Felix Stickelb2, Gerald Niedobitek3, Detlef Schuppan2
aClinical Pharmacology, University of Bern, Bern, Switzerland. bGastroenterology, Beth Israel Deaconess, Boston, MA, USA. cInstitute of Pathology, University of Erlangen, Erlangen, Germany

#1053
TOLL-LIKE RECEPTOR-9 ACTIVATION AMELIORATES HEPATIC FIBROSIS ASSOCIATED WITH LYMPHOCYTE INTERACTIONS

Jonathan H. Axelrodc2, Elena Khvalevskyc2, Sarit Doron3, Jonathan Enkc2, Yael Nechemiac2, Orit Pappoc3, Ethan Galunc2, Rifaat Safadif1
1Liver and Gastroenterology Units; Division of Medicine, Hadassah Medical Center, Jerusalem, Israel. 2Goldyne Savad Institute of Gene Therapy, Hadassah Medical Center, Jerusalem, Israel. 3Pathology Department, Hadassah Medical Center, Jerusalem, Israel

#1054
ANGIOTENSIN 1–7 REDUCES BILE DUCT PROLIFERATION AND HEPATIC FIBROSIS IN THEBILE DUCT LIGATED RAT

John S. Lubel, Chandana B. Herath, Zhiyuan Jia, Louise M. Burrell, Peter W. Angus
Medicine, University of Melbourne, Melbourne, VIC, Australia

#1055
ROLE OF C-C CHEMOKINE RECEPTOR 2 (CCR2) DURING CONSTITUTION AND RESOLUTION OF FIBROSIS INDUCED BY CARBONE TETRACHLORIDE IN MICE

Claudia Mitchell1, Dominique Couton1, Vincent O. Mallet1, Stanislav Pol2, Laurent Renia2, William A. Kuziel3, Helene Gilgenkrantz1
1genetic and development, Cochin Institute, INSERM U567, CNRS UMR8104, Paris, France. 2Immunology Department, Cochin Institute, INSERM U567, CNRS UMR8104, Paris, France. 3Autoimmune and inflammatory diseases, Protein design labs, Fremont, CA, USA

#1056
INCREASED SUSCEPTIBILITY TO HEPATIC STEATOSIS, INFLAMMATION AND ADVANCED FIBROSIS IN APOLIPOPROTEIN-E DEFICIENT MICE

Natalía Ferré1, Marcos Martinez-Clemente1, Marta López-Parra1, Ana González-Pérez1, Raquel Horrillo1, Anna Planagumà1, Jordi Camps3, Jorge Joven1, Ramón Bataller2, Vicente Arroyo2, Juan Rodes2, Joan Claria1
1Department of Biochemistry and Molecular Genetics, Hospital Clinic, Centro de Investigación Biomédica Esther Koplowitz (CIBEK), IDIBAPS, University of Barcelona, Barcelona, Spain. 2Liver Unit, Hospital Clinic, Barcelona, Spain. 3Centre de Recerca Biomèdica, Hospital Universitari Sant Joan de Reus, Institut de Recerca en Ciències de la Salut (IRCIS), Reus, Spain

#1057
DELETION OF THE THROMBIN RECEPTOR GENE, PAR 1, AMELIORATES LIVER FIBROSIS AND DECREASES TGFβ EXPRESSION BY HEPATIC STELLATE CELLS IN A MURINE MODEL OF CIRRHOSIS

Virginia H. Knight, Jorge Tchongue, Peter Tipping, William Sievert
Centre for Inflammatory Diseases, Monash University, Clayton, VIC, Australia
#1058
HUMAN DISCOIDIN DOMAIN RECEPTOR 1: INTRAHEPATIC FORMS AND IN VITRO FUNCTIONS
Sunmi Song, Nicholas A. Shackel, Xin M. Wang, Katerina Ajami, Geoffrey W. McCaughan, Mark D. Gorrell
Centenary Institute, Royal Prince Alfred Hospital, University of Sydney, Camperdown, NSW, Australia

#1059
BXD RECOMBINANT INBRED MOUSE LINES - A GENETIC REFERENCE POPULATION FOR DISSECTION OF THE COMPLEX GENETICS OF LIVER FIBROSIS
Rabea Hall, Sonja Hillebrandt, Katrin Hochrath, Frank Grunhage, Yildiz Yildiz, Susanne Weber, Stephanie Schwartz, Tilman Sauverbruch, Frank Lammert
Department of Internal Medicine I, University Hospital Bonn, University of Bonn, Bonn, Germany

#1060
GENETIC ASSOCIATION STUDY OF PROFIBROGENIC GENE VARIANTS USING TRANSIENT ELASTOGRAPHY FOR PHENOTYPIC CHARACTERIZATION OF LIVER FIBROSIS
Frank Grünhage, Stephanie Schwartz, Tilman Sauverbruch, Frank Lammert
Department of Internal Medicine I, University Hospital Bonn, University of Bonn, Bonn, Germany

#1061
SYNERGISTIC ANTI-FIBROTIC EFFICACY OF STATIN AND PROTEIN KINASE C INHIBITOR IN HEPATIC FIBROSIS
Jong In Yang1, Jung-Hwan Yoon1, Yung-Jue Bang1, Sun Jung Myung1, Bo Hyun Kim1, Jeong-Hoon Lee1, Dong Hee Kim1, Won Kim1, Kyung-Suk Suh2, Hyo-Suk Lee1
1Department of Internal Medicine, Seoul National University College of Medicine, Seoul, South Korea. 2Department of Surgery, Seoul National University College of Medicine, Seoul, South Korea

#1062
THE IMPACT OF BONE MARROW STEM CELLS ON LIVER FIBROSIS IS CRITICALLY DETERMINED BY THEIR ROUTE OF CELL TRAFFICKING
Catherine Payne2, Kay Samuel2, Anne Pryde2, Patricia Lee2, Andrew Jeske2, Stuart Forbes2, John Plevis3, John Iredale4, Philip N. Newsome1,3
1Liver Research Group, University of Birmingham, Birmingham, United Kingdom. 2University of Edinburgh, Edinburgh, United Kingdom

#1063
TGFβ1 STIMULATES THE HUMAN α1(I) COLLAGEN PROMOTER BY COOPERATION BETWEEN SMAD2/4 AND SP1 TRANSMITTING FACTORS
Polina Sysa, James J. Potter, Xiaopu Liu, Esteban Mezey Medicine, Johns Hopkins University School of Medicine, Baltimore, MD, USA

#1064
A HUMAN RECOMBINANT ANTIBODY FOR TARGETING ANTI-FIBROGENIC THERAPEUTICS TO MYOFIBROBLASTS IN VIVO
Angela Douglass3,1, Karen Wallace1, Rebecca Parr2, Jennifer Park2, Elaine Durward1, Caroline Bareille2, Andrew J. Porter2,3, Matthew C. Wright1,3
1Institute Cellular Medicine, Newcastle University, Newcastle Upon Tyne, United Kingdom. 2Haptogen, Aberdeen, United Kingdom. 3University of Aberdeen, Aberdeen, United Kingdom

#1065
ENHANCED IL-6 PRODUCTION BY HEPATIC STELLATE CELLS IN RESPONSE TO IMATINIB MESYLATED STI571 - (GLEEVEC ®), A NOVEL LINK BETWEEN RECEPTOR TYROSINE KINASE INHIBITION AND HEPATIC REGENERATION
Carlos E. Alvarez1, Youngchul Kim1, Efsevia Albanis1, Maria Isabel Fiel2, Scott L. Friedman1
1Division of Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA. 2Department of Pathology, Mount Sinai School of Medicine, New York, NY, USA

#1066
CD147 REGULATION OF HEPATOCYTE DERIVED MATRIX METALLOPROTEINASES: A NOVEL PATHWAY INVOLVED IN LIVER FIBROGENESIS
Sarah R. Richardson1, Fiona J. Warner1, Geoff W. McCaughan1,2, Mark D. Gorrell1,2, Rosa Lam1, Nicholas A. Shackel1,2
1Liver Immunobiology, Centenary Institute for Cancer Medicine and Cell Biology, Camperdown, NSW, Australia. 2AW Morrow Gastroenterology and Liver Centre, Royal Prince Alfred Hospital, Camperdown, NSW, Australia

#1067
DETECTION AND PREVENTION OF HEPATIC FIBROSIS TARGETING TGF-β ACTIVATION REACTION
Soichi Kojima1, Ayako Arai1, Ryutaro Teraoka1, Shinji Ogawa2, Katsuhiro Shinjo2
1Mal Cell Pathol Res Unit, RIKEN, Wako, Japan. 2Nagoya Lab, Pfizer Japan, Nagoya, Japan

#1068
C-REACTIVE PROTEIN AMELIORATES HEPATIC FIBROGENESIS THROUGH INHIBITION OF HEPATIC STELLATE CELL TRANSACTIVATION
Kenichi Ikejima, Kumiko Arai, Kazuyoshi Kon, Tamonori Aoyama, Kyoko Okumura, Reiko Yaginuma, Shunhei Yamashina, Sumio Watanabe
Department of Gastroenterology, Juntendo University, Tokyo, Japan

#1069
THE FUNCTIONAL CONTRIBUTION OF BONE MARROW-DERIVED CELLS TO LIVER FIBROSIS IN A MOUSE MODEL OF CHRONIC LIVER INJURY
Yiannis N. Kallis1, Rob Goldin2, John Iredale3, Stuart Forbes3
1Dept of Medicine, Imperial College London, London, United Kingdom. 2Dept. of Histopathology, Imperial College London, London, United Kingdom. 3MRC Centre for Inflammation Research, University of Edinburgh, Edinburgh, United Kingdom
ACCELERATED ORTHOTOPIC HCC GROWTH IS LINKED WITH INCREASED PRO-ANGIOGENIC AND PRO-METASTATIC FACTORS IN MURINE LIVER FIBROSIS

Miroslaw Kornek¹, Esther Raskopf¹, Rene Tolba², Tilman Sauer-bruch¹, Volker Schmitz¹
¹Internal Medicine I, University Hospital Bonn, Bonn, Germany. ²Department of Surgery, University Hospital Bonn, Bonn, Germany

CONCORDANCE BETWEEN FIBROTEST® (FT) AND FIBROSCAN® (FS): A NEW NON-INVASIVE METHODOLOGY FOR IMPROVING ACCURACY IN A WORLD WITHOUT A GOLD STANDARD

Thierry Poynard¹, Patrick Ingliz¹, Mona Munteanu², Pascal Lebray¹, Rachel Morra¹, Djamilia Messous¹, Françoise Imbert-Bismut¹, Yves Benhamou¹, Vlad Ratziu¹
¹Hepato Gastro Groupe Hospital, Pitie Salpetriere, Paris, France. ²Biopredictive, Paris, France

LACK OF INDUCIBLE NITRIC OXIDE SYNTHASE IN A MOUSE MODEL WITH CARBON TETRACHLORIDE INJURY LEADS TO INCREASED APOPTOSIS AND DECREASED FIBROSIS

Ghazaleh Aram, James J. Potter, Xiaopu Liu, Esteban Mezey Medicine, Johns Hopkins University, Baltimore, MD, USA

EXTRA-CELLULAR FIBRONECTIN INDUCED HEPATIC OVAL CELL PROLIFERATION THROUGH CYCLOOXYGENASE-2-INDUCED PROSTAGLANDIN SIGNALING

Si Hyun Bae¹, Seung Kew Yoon¹, Jong Young Choi¹, Jung Hyun Kwon¹, Soung Wan Jeong¹, Il Hoan Oh¹, Kun Ho Yoon¹, Seh Hoon Oh², Bryon E. Petersen²

#1094
HBEAG SEROCONVERSION CORRELATES WITH A HIGH NUMBER OF CORE GENE MUTATIONS AND WITH GENOTYPES B AND D IN PAEDIATRIC PATIENTS

Ivana Carey, Maria Mytilinaiou, Antonietta Giannattasio, Sanjay Bansal, Paul Cheeseman, Dita Cebecauerova, Giorgina Mieli-Vergani, Diego Vergani
Institute of Liver Studies, King’s College London School of Medicine at King’s College Hospital, London, United Kingdom

#1095
GRAFT HISTOLOGY UP TO 10 YEARS AFTER PEDIATRIC LIVER TRANSPLANTATION: HIGH INCIDENCE OF SEVERE FIBROSIS, CORRELATED WITH TRANSPLANT RELATED FACTORS

Rene Scheenstra1, Paul M. Peeters2, Henk-Jan J. Verkade1, Anette S. Gouw3
1Pediatric Gastroenterology, University Medical Center Groningen, Groningen, Netherlands. 2Hepatobiliary Surgery, University Medical Center Groningen, Groningen, Netherlands. 3Pathology, University Medical Center Groningen, Groningen, Netherlands

#1096
IMPROVED PREDICTIVE VALUE OF PELD WITH THE ADDITION OF SERUM SODIUM AND PLATELET COUNT

Tassos Grammatikopoulos1, Rachel M. Taylor1, Juan Gonzalez2, Nora Donaldson2, Anil Dhawan1
1Paediatric Liver Centre, King’s College London School of Medicine at King’s College Hospital NHS Foundation Trust, London, United Kingdom. 2Biostatistics Unit, King’s College London Dental Institute, London, United Kingdom

#1097
PEDIATRIC LIVER RETRANSPANTATION: OUTCOMES AND A PROGNOSTIC SCORING TOOL

Adam R. Davis1, Philip Rosenthal1, David Glidden2
1Pediatrics, UCSF, San Francisco, CA, USA. 2Epidemiology and Biostatistics, UCSF, San Francisco, CA, USA

#1098
LIPID-ENRICHED DIET INDUCES GROWTH RETARDATION AND LIVER STEATOSIS IN CYSTIC FIBROSIS MICE

Charles-Henry Cottart1, Elise Bonvin2, Colette Rey1, Dominique Wendem3, Jean-François Bernardin4, Sylvie Dumont3, E. Lasnier5, Dominique Debray4, Annick Clément2, Chantal Housset1, Monique Bonora2
1UMR S 680, Inserm, Université Pierre et Marie Curie - Paris 6, Paris, France. 2UMR S 719, Inserm, Université Pierre et Marie Curie - Paris 6, Paris, France. 3Anatomie Pathologique, AP-HP Hôpital Saint-Antoine, Paris, France. 4EA3499, Université Pierre et Marie Curie - Paris 6, Faculté de Médecine, Paris, France. 5Biochimie, AP-HP Hôpital Saint-Antoine, Paris, France
#1099
CAN INSULIN-LIKE GROWTH FACTOR BINDING PROTEIN-1 (IGFBP-1) IDENTIFY OVERWEIGHT CHILDREN AT RISK OF DEVELOPING STEATOHepATITIS?
Carlos E. Martinelli1, Alexsandra C. Moura-Ribeiro1, Paula C. Bez- zan1, Jorge Elias2, Ana L. Martinelli2
1Pediatrics, School of Medicine of Ribeirão Preto, University of São Paulo, Ribeirão Preto, Brazil. 2Medicine, School of Medicine of Ribeirão Preto, University of São Paulo, Ribeirão Preto, Brazil

#1100
PREDICTORS FOR SEVERE COURSE OF CYSTIC FIBROSIS-RELATED LIVER DISEASE IN CHILDREN
Nynke Doornebal, Frank Bodewes, HenkJan J. Verkade
Pediatries, University Medical Centre Groningen, Groningen, Netherlands

#1101
PATTERN OF DIAGNOSTIC EVALUATION FOR THE CAUSES OF PEDIATRIC ACUTE LIVER FAILURE (PALF): OPPORTUNITIES FOR QUALITY IMPROVEMENT
Michael Narkewicz1, Dominic Dell Olio6, Saul J. Karpen5, Susan Krug7, Karen F. Murray4, Kathleen B. Schwarz8, Nada Yazigi7, Song Zhang3, Steven H. Belle2, For the Pediatric Acute Liver Failure Study Group3
1Pediatrics, University of Colorado at Denver Health Sciences Center, Denver, CO, USA. 2Pediatrics, University of Pittsburgh, Pittsburgh, PA, USA. 3Biostatistics, University of Pittsburgh, Pittsburgh, PA, USA. 4Pediatrics, University of Washington, Seattle, WA, USA. 5Pediatrics, Baylor College of Medicine, Houston, TX, USA. 6University of Birmingham, Birmingham, United Kingdom. 7Pediatrics, Cincinnati Children's Hospital, Cincinnati, OH, USA. 8Pediatrics, Johns Hopkins University, Baltimore, MD, USA

#1102
CLINICAL SIGNIFICANCE OF THE ABERNETHY MALFORMATIONS (CONGENITAL ABSENCE OR HYPOPLASIA OF THE PORTAL VEIN)
Matthew Y. Suh1, Humberto Azpurua2, Yoshihiro Kitano3, Heung B. Kim1
1Surgery, Children’s Hospital Boston, Boston, MA, USA. 2Obstet- rics and Gynecology, Yale New Haven Hospital, New Haven, CT, USA. 3Surgery, Saitama Children’s Medical Center, Saitama, Japan

#1103
SCLEROSING CHOLANGITIS IN CHILDREN—RETROSPECTIVE SINGLE CENTER REVIEW
Tamir Miloh1,2, Ronen Arnon1,2, Benjamin L. Shneider3, Frederick Suchy1, Nanda Kerkar1,2
1Pediatrics, Mount Sinai Hospital, New-York, NY, USA. 2RMTI, Mount Sinai Hospital, New York, NY, USA. 3Division of Gastroenterology, Children’s Hospital Pittsburgh, Pittsburgh, PA, USA

#1104
ROLE OF LIVER HISTOLOGY IN THE MANAGEMENT OF ACUTE LIVER FAILURE IN CHILDREN
Jonathan M. Hind, Alberto Quaglia, Rachel Taylor, Anil Dhawan
Paediatric Liver Centre, King’s College Hospital, London, United Kingdom

#1105
BUDD CHIARI SYNDROME IN CHILDREN: A SINGLE CENTRE EXPERIENCE IN THE UNITED KINGDOM
Roshni Varan1, Natalie J. Bab1, John Karani3, Ghulam J. Mufti2, Nigel Heaton3, Giorgina Mieli-Vergani1, Anil Dhawan1
1Paediatric Liver Centre, King’s College Hospital NHS Foundation Trust, London, United Kingdom. 2Haematology Department, King’s College Hospital NHS Foundation Trust, London, United Kingdom. 3Liver Transplantation, King’s College Hospital NHS Foundation Trust, London, United Kingdom. 4Radiology Department, King’s College Hospital NHS Foundation Trust, London, United Kingdom

Steatosis and Steatohepatitis: Clinical

#1106
CLINICAL CORRELATES OF HISTOPATHOLOGY IN PEDIATRIC NONALCOHOLIC FATTY LIVER DISEASE
Heather M. Patton1, Aynur Unalp2, Jeffrey Schwimmer1, Jean Molleston3, Ann Scheimann4, Karen F. Murray5, Mark Van Natta2, Joel E. Lavine1
1UCSD Medical Center, San Diego, CA, USA. 2Johns Hopkins School of Public Health, Baltimore, MD, USA. 3Riley Hospital for Children, Indianapolis, IN, USA. 4Johns Hopkins Children’s Center, Baltimore, MD, USA. 5Children’s Hospital and Regional Medical Center, University of Washington, Seattle, WA, USA

#1107
NON-ALCOHOLIC FATTY LIVER DISEASE AS AN IMPORTANT RISK FACTOR OF CORONARY HEART DISEASE
Donghee Kim1, Su Yeon Choi1, Su kyung An1, Won Kim2, Yong Jin Jung3, Chan Soo Shin1, Sang Heon Cho1, Byung Hee Oh1
1Healthcare Research Institute, Seoul national university hospital Gangnam Healthcare Center, Seoul, South Korea. 2Internal medi- cine, Seoul national university hospital, Seoul, South Korea

#1108
INHERITED VARIANTS OF GENES INVOLVED IN INSULIN SIGNALING AFFECT THE RISK OF HEPATIC FIBROSIS IN NAFLD
Paola Dongiovanni, Luca Valenti, Raffaela Rametta, Anna Ludovica Fracanzani, Silvia Fargion
Internal Medicine, University of Milan, Ospedale Policlinico IRCCS, Milano, Italy
#1109
DAILY CANNABIS USE, A NOVEL RISK FACTOR OF STEATOSIS SEVERITY IN PATIENTS WITH CHRONIC HEPATITIS C

Christophe Hezode1,2, Elie-Serge Zafrani3,2, Françoise Roudot-Thoraval3,4, Charlotte Costentin1, Ali Hessami3, Fatima Medkour1, Magali Bouvier-Alias4,2, Jean-Michel Pawlotsky4,2, Sophie Lotersztajn2, Ariane Mallat1,2
1Hepatology, Hopital Henri Mondor, Paris XII University, Creteil, France. 2INSERM U841, Hopital Henri Mondor, Paris XII University, Creteil, France. 3Pathology, Hopital Henri Mondor, Paris XII University, Creteil, France. 4Virology, Hopital Henri Mondor, Creteil, France. 5Public Health, Hopital Henri Mondor, Paris XII University, Creteil, France

#1110
PIGMENT EPITHELIUM-DERIVED FACTOR (PEDF) REGULATES HEPATOCYTE LIPID CONTENT THROUGH ITS INTERACTION WITH ADIPOSE TRIGLYCERIDE LIPASE (ATGL)

Arijeet Gattu1, Christine Shugrue1,2, Susan Crawford3, Chuhan Chung1,2
1VA CT Medical Center, West Haven, CT, USA. 2Yale University, New Haven, CT, USA. 3Pathology, Northwestern University, Chicago, IL, USA

#1111
ALCOHOL CONSUMPTION IN SEVERELY OBESE PATIENTS WITH NONALCOHOLIC FATTY LIVER DISEASE: RELATIONSHIP WITH HEPATIC FIBROSIS

Helma P. Cotrim1, Alessandro Almeida1, Erivaldo Alves1, Daniel May1, Antonio Ricardo Ferraz1, Stephen H. Caldwell3, Luiz Antonio Freitas2
1Medicine, Universidade Federal da Bahia, Salvador, Brazil. 2CPqGM - FIOCRUZ - BAHIA, Salvador, Brazil. 3Virginia University, Charlottesville, VA, USA

#1112
CHOLESTEROL ACCUMULATION IN PATIENTS WITH FATTY LIVER DISEASE CORRELATES WITH INDUCTION OF CHOLESTEROL-REGULATING ENZYMES AND SIGNS OF STEATOHEPATITIS

Francisco Caballero, Jordi Colmenero, Ramon Bataller, Antonio Lacy, Jose C. Fernandez-Checa, Juan Caballero, Carmen Garcia-Ruiz
Liver Unit, Hospital Clinic, Barcelona, Spain

#1113
ARTERIALIZATION OF CENTRAL ZONES IN NONALCOHOLIC STEATOHEPATITIS (NASH)

Linda D. Ferrell1, Patricia Bell2, Nathan M. Bass3, Clinical Research Network for the Nash2
1Pathology, Univ of California San Francisco, San Francisco, CA, USA. 2NASH Clinical Research Network, Johns Hopkins Center for Clinical Trials, Baltimore, MD, USA. 3Medicine, Univ of California San Francisco, San Francisco, CA, USA

#1114
MODEST WINE DRINKING IS ASSOCIATED WITH A DECREASED PREVALENCE OF SUSPECTED NONALCOHOLIC FATTY LIVER DISEASE

Winston Dunn1, Ronghui Xu3, Jeffrey Schwimmer2
1Medicine, UCSD, San Diego, CA, USA. 2Pediatrics, UCSD, San Diego, CA, USA. 3Mathematics, UCSD, San Diego, CA, USA

#1115
ANALYSIS OF HEPATIC EXPRESSION OF GENES INVOLVED IN LIPID AND IRON METABOLISM IN NONALCOHOLIC FATTY LIVER DISEASE

Hironori Mitsuyoshi1, Kohichiroh Yasui1, Yuichi Harano2, Yoshito Itoh1, Takeshi Okanoue3
1Kyoto Prefectural University of Medicine, Kyoto, Japan. 2Akashi City Hospital, Akashi, Japan. 3Saiseikai Suita Hospital, Suita, Japan

#1116
NON-INVASIVE DIAGNOSTIC BIOMARKERS FOR NON-ALCOHOLIC STEATOHEPATITIS (NASH)

Ancha Baranova1,2, Mohammed Jarar1,2, Clare Nugent1,3, Arian Afendy1,3, Caitlin Quiigley1, Maria Stepanova1,2, Hazem Elariny1, Zachary Goodman4, Vikas Chandhoke1,2, Zobair M. Younossi1,3
1Translational Research Institute, Inova Health System, Annandale, VA, USA. 2Department of Molecular and Microbiology, George Mason University, Manassas, VA, USA. 3Center for Liver Diseases, Inova Health System - Inova Fairfax Hospital, Annandale, VA, USA. 4Armed Forces Institute of Pathology, Washington, DC, USA

#1117
EFFECT OF PENTOXIFYLLINE ON CLINICAL, BIOCHEMICAL AND METABOLIC PARAMETERS, HEPATIC NECROINFLAMMATION, FIBROSIS AND STELLATE CELL ACTIVATION IN PATIENTS WITH NONALCOHOLIC STEATOHEPATITIS

Deepak K. Singh1, Puja Sakhuja1, Archana Rastogi1, Ajay Kumar2, Ranjana Gondal1, Shiv K. Sarin2
1Pathology, G B Pant hospital, Delhi, India. 2Gastroenterology, G B Pant Hospital, Delhi, India

#1118
ADIPOSE TISSUE OF INSULIN RESISTANCE IN NASH PATIENTS

Masahiko Shimada1,2, Hiromu Kawahara1, Masayoshi Yamada1, Masayuki Fukura1, Mutsumi Tsuchishima1, Shuhei Yoshida2, Yoshiaki Kitamura2, Morihiko Yoshino2, Shujiro Takase1
1Department of Gastroenterology, Kanazawa Medical University, Uchinada, Japan. 2Department of Gastroenterology, TMG Asakadai Central Medical Hospital, Asaka, Japan
#1119
HIGH SENSITIVITY C-REACTIVE PROTEIN IS AN INDEPENDENT CLINICAL FEATURE OF NONALCOHOLIC STEATOHEPATITIS (NASH) AND ALSO OF THE SEVERITY OF FIBROSIS IN NASH
Yuichi Nozaki, Masato Yoneda, Takuma Higurashi, Hiroshi lida, Hironori Mawatari, Hiroki Endo, Ayako Tamimoto, Kyoko Yonemitsu, Tomoyuki Akiyama, Koji Fujita, Hirokazu Takahashi, Masahiko Inamori, Noritoshi Kobayashi, Yasunobu Abe, Kensuke Kubota, Hiroyuki Kinkoshi, Satoru Saito, Atsushi Nakajima Division of Gastroenterology, Yokohama City University, Yokohama, Japan

#1120
PRESENCE OF OBSTRUCTIVE SLEEP APNEA IS ASSOCIATED WITH FIBROSIS IN PATIENTS WITH NONALCOHOLIC FATTY LIVER DISEASE
Poonam Mishra, Clare Nugent, Chunhong Bai, Mariam Afendy, Theresa Egasani-Elises, Hazem Elariny, Zobair M. Younossi Center for Liver Diseases, Inova Health System - Inova Fairfax Hospital, Annandale, VA, USA

#1121
PROTEOMIC ANALYSIS OF SERUM BIOMARKERS IN PATIENTS WITH NONALCOHOLIC STEATOHEPATITIS USING SELDI-TOF/MS OR MALDI-TOF/MS
Hirofumi Uto1, Yuko Sato2, Yoichi Ishida3, Yoichiro Takami3, Shuji Kanamura1, Akihiro Moriuchi1, Susumu Hasegawa1, Makoto Oke-tani1, Akio Ido1, Tomoaki Nakajima4, Takeshi Okanoue5, Hirohito Tsoubuchi1
1Department of Digestive and Life-style related Disease, Kagoshima University Graduate School of Medical and Dental Sciences, Kagoshima, Japan. 2Miyazaki Prefectural Industrial Support Foundation, Miyazaki, Japan. 3Molecular Gastroenterology and Hepatology, Kyoto Prefectural University of Medicine Graduate School of Medical Science, Kyoto, Japan. 4Liver Diseases Section, Akashi Municipal Hospital, Akashi, Japan

#1122
PIOGLITAZONE ENHANCES HEPATIC, MUSCLE AND ADIPOSE TISSUE INSULIN SENSITIVITY AND AMELIORATES SYSTEMIC INFLAMMATION IN PATIENTS WITH IGT OR T2DM AND NASH
Kenneth Cusi1, Renata Belfort 1, Steve Harrison2, Bogdan Balas1, Stephen Schenker1, Celia Darland1, Amalia Gastaldelli1, Kenneth Brown1, Jean Hardies1
1The University of Texas Health Science Center at San Antonio, San Antonio, TX, USA. 2Brooke Army Medical Center, San Antonio, TX, USA

#1123
OXIDATIVE STRESS PROFILES IN PEDIATRIC NONALCOHOLIC FATTY LIVER DISEASE
Richard Rosencrantz1, Hong Lin2, Yin Yan Xu3, Susanna Cunningham-Ramles1,2
1Pediatric Gastroenterology and Nutrition, New York Presbyterian Hospital-Weill Cornell Medical Center, New York, NY, USA. 2Pediatric Hematology/Oncology, New York Presbyterian Hospital-Weill Cornell Medical Center, New York, NY, USA. 3Host Defense Program, New York Presbyterian Hospital-Weill Cornell Medical Center, New York, NY, USA

#1124
SHORT-TERM VARIABILITY IN COMMONLY USED LIVER TESTS: IMPLICATIONS FOR CLINICAL PRACTICE
Mariana Lazo1, Elizabeth Selvin2, Jeanne M. Clark1,2
1School of Medicine, Johns Hopkins Medicine, Baltimore, MD, USA. 2Welch Center for Prevention, Epidemiology, and Clinical Research, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA

#1125
ADIPOPHILIN EXPRESSION AND OXIDIZED PHOSPHATIDYLCHOLINE LOCALIZATION IN BALLOONED HEPATOCYTES IN NONALCOHOLIC STEATOHEPATITIS
Hideki Fujii1, Yoshihiro Ikura2, Norifumi Kawada1, Hiroyuki Itaba3, Sang H. Park4, Julia C. Iezzon5, Stephen H. Caldwell6
1Hepatology, Osaka City University Graduate School of Medicine, Osaka, Japan. 2Pathology, Osaka City University Graduate School of Medicine, Osaka, Japan. 3Biological Chemistry, Showa University, Tokyo, Japan. 4GI/Hepatology, University of Virginia, Charlottesville, VA, USA. 5Pathology, University of Virginia, Charlottesville, VA, USA

#1126
ASSOCIATION OF AST AND ALT WITH LIVER HISTOLOGY IN ADULTS WITH NAFLD
Jeanne M. Clark1,2, Mark Van Natta2, David Kleiner3, Naga P. Chalasani4, Arthur J. McCullough5, Brent A. Neuschwander-Tetri6, Aynur Ünalp7, Jay H. Hoofnagle3, Anna Mae Diehl7
1Medicine, Johns Hopkins University, Baltimore, MD, USA. 2Gastroenterology, Johns Hopkins University, Baltimore, MD, USA. 3NIH/NIDDK, Bethesda, MD, USA. 4Medicine, Indiana University, Indianapolis, IN, USA. 5Gastroenterology/Hepatology, Case Western Reserve, Cleveland, OH, USA. 6St. Louis University, St. Louis, MO, USA. 7Medicine, Duke University, Durham, NC, USA

#1127
METABOLIC SYNDROME AMONG CHILDREN WITH VARIABLE FEATURES OF NONALCOHOLIC FATTY LIVER DISEASE
Heather M. Patton1, Aynur Ünalp2, Katherine Yates3, Jeffrey B. Schwimmer1, Joel E. Lavine1
1UCSD Medical Center, San Diego, CA, USA. 2Johns Hopkins University School of Public Health, Baltimore, MD, USA

#1128
ADVANCED FIBROSIS IN NAFLD IS ASSOCIATED WITH LIFETIME ALCOHOL USE, DIABETES, AND AGE BUT NOT WITH LIFETIME CIGARETTE SMOKING
Claudia O. Zein1, Aynur Ünalp3, Ryan Colvin3, Arthur J. McCul-lough2,3, for the NASH CRN Research Group3
1Gastroenterology and Hepatology, Case Western Reserve University, Cleveland, OH, USA. 2Gastroenterology and Hepatology, Cleveland Clinic, Cleveland, OH, USA. 3NASH CRN Research Group, Baltimore, MD, USA
#1129
NON-ALCOHOLIC FATTY LIVER DISEASE CAN INDUCE PORTAL HYPERTENSION, DEMONSTRATED BY HEPATIC VENOUS PRESSURE GRADIENT MEASUREMENT, RELATED TO THE SEVERITY OF STEATOSIS BUT NOT FIBROSIS IN OVERWEIGHT AND OBESE PATIENTS
Sven M. Francque1, Ann Verrijken2, Ilse Mertens2, Eric Van March2, Luc Van Gaal1, Paul Pelckmans1, Peter Michielsen1
1Gastroenterology, Hepatology, University Hospital Antwerp, Edegem, Belgium. 2Diabetology, Metabolic Diseases and Nutrition, University Hospital Antwerp, Edegem, Belgium. 3Pathology, University Hospital Antwerp, Edegem, Belgium

#1130
STUDY OF A POLYMORPHISM IN THE GLUTAMATE-CYSTEINE LIGASE (GCLC) GENE IN NONALCOHOLIC FATTY LIVER DISEASE
Claudia P. Oliveira1, Ana Mercedes C. Luna2, Jose T. Stefano1, Telma E. Santos1, Suzana M. Vieira2, Vicencia M. Rodrigues De Lima1, Maria Angela H Z. Fortes2, Venancio A F. Alves3, Flair J. Carrilho1, Maria Lucia Correa-Giannella2
1Gastroenterology (LIM-07), School of Medicine of University of São Paulo, São Paulo, Brazil. 2Endocrinology (LIM-25), University of Sao Paulo School of Medicine, Sao Paulo, Brazil. 3Pathology (LIM-14), University of Sao Paulo School of Medicine, Sao Paulo, Brazil

#1131
INFLUENCE OF IMPAIRED GLUCOSE TOLERANCE, GLUCOSE CONTROL STATUS, LIGHT TO MODERATE ALCOHOL CONSUMPTION, AND REDUCED CARBOHYDRATE DIETS ON SERUM ALT CHANGE DURING RAPID WEIGHT LOSS IN THE RESIDENTIAL WEIGHT LOSS PROGRAM
Ayako Suzuki1, Ronald Sha2, Amy Wachholtz2, Martin Binks2, Anna Mae Diehl1
1Division of Gastroenterology, Dept. of Medicine, Duke University Medical Center, Durham, NC, USA. 2Duke Diet and Fitness Center, Duke University Health System, Durham, NC, USA. 3Department of Community and Family Medicine, Duke University Medical Center, Durham, NC, USA. 4Division of Medical Psychology, Dept. of Psychiatry and Behavioral Sciences, Duke University Medical Center, Durham, NC, USA

#1132
NON-ALCOHOLIC FATTY LIVER DISEASE IS ASSOCIATED WITH TRANSCRIPTIONAL DYSREGULATION OF THE CORTICOSTEROID METABOLISING ENZYME 11βHSD-1 LEADING TO EXCESS INTRAHEPATIC STEROID EXPOSURE
F. M. Coyle1, N. F. Taylor2, J. P. Monson3, W. M. Drake4, G. R. Foster1
1Gastroenterology, Institute of Cell and Molecular Science, QMUL, London, United Kingdom. 2Clinical Biochemistry, King’s College Hospital, London, United Kingdom. 3Clinical Endocrinology, Barts and the London School of Medicine, London, United Kingdom

#1133
NORMAL ALT IN NAFLD SHOULD NOT PRECLUDE LIVER BIOPSY
Anna Ludovica Fracanzani1, Luca Valenti1, Elisabetta Bugianesi2, Giulio Marchesini3, Marco Andreolli4, Agostino Collì4, Cristina Bertelli1, Erika Fatta1, Silvia Fargion1
1Internal Medicine, University of Milan, Ospedale Policlinico IRCCS, Milano, Italy. 2Gastroenterology, Ospedale San Giovanni Battista, Università di Torino, Torino, Italy. 3Internal Medicine, Universita Alma Mater Studiorum Bologna, Bologna, Italy. 4Internal Medicine, Ospedale A Manzoni, Lecco, Italy

#1134
ULTRASTRUCTURAL EVALUATION OF HEPATOCYTES WITH TYPE 2 MALLORY-DENK BODIES: CLUES TO BALLOONING IN NONALCOHOLIC STEATOHEPATITIS (NASH)
Stephen H. Caldwell1, Jan A. Redick2, Christine A. Davis2, Elizabeth M. Brun3, Vicencia M. Lima5, Curtis K. Argo1, Abdullah M. Al-Osaimi1, Brent A. Tetri4
1GI/Hepatology, University of Virginia, Charlottesville, VA, USA. 2Advanced Microscopy Facility, University of Virginia, Charlottesville, VA, USA. 3Pathology, Saint Louis University, Saint Louis, MO, USA. 4GI/Hepatology, Saint Louis University, Saint Louis, MO, USA. 5GI/Hepatology, University of Sao Paulo, Sao Paulo, Brazil

#1135
RELATIONSHIP OF BMI AND THE METABOLIC SYNDROME IN NON-DIABETIC PATIENTS WITH NAFLD
James e. Nelson1, Katherine Yates2, Aynur Unalp2, Kris V. Kowdley1
1GI, Virginia Mason Medical Center/Benaroya Research Institute, Seattle, WA, USA. 2School of Public Health, Johns Hopkins, Baltimore, MD, USA

#1136
FATIGUE IN NAFLD IS SEVERE AND ASSOCIATES WITH EXCESSIVE DAYTIME SOMNOLENCE BUT NOT WITH LIVER DISEASE SEVERITY OR INSULIN RESISTANCE
Julia L. Newton, David E. Jones, Lara Kane, Elsbeth Henderson, Jessie Pairman, Katharine Wilton, Alastair D. Burt, Christopher P. Day
Institute for Cellular Medicine, Newcastle University, Newcastle, United Kingdom

#1137
INFLUENCE OF ADIPONECTIN GENE POLYMORPHISMS IN PATIENTS WITH NONALCOHOLIC FATTY LIVER DISEASE
Katsutoshi Tokushige, Etsuko Hashimoto, Ayae Kabutake, Mihoko Takakura, Maki Tobari, Storu Yatsusi, Makiko Tanai, Keiko Shiratori
Tokyo Women’s Medical University, Tokyo, Japan
#1138
HISTOLOGICAL CHARACTERISTICS OF PATIENTS WITH 'CRYPTOGENIC' CIRRHOSIS AND PRIOR BIOPSY SHOWING NASH
Vanessa D. Lee1, David Kleiner2, Abdullah M. Al-Osaimi1, Curtis K. Argo1, Patrick G. Northup1, Carl L. Berg1, Timothy L. Pruett3, Timothy M. Schmitt1, Stephen H. Caldwell1
1GI/Hepatology, University of Virginia, Charlottesville, VA, USA. 2Clinical Pathology, National Cancer Institute, Bethesda, MD, USA. 3Liver Transplant Surgery, University of Virginia, Charlottesville, VA, USA

#1139
NAFLD AS A RISK FACTOR FOR THE DEVELOPMENT OF DIABETES AND THE METABOLIC SYNDROME: AN ELEVEN YEAR FOLLOW-UP STUDY
Leon A. Adams 1, Oliver R. Waters2, Matthew Knuiman3, Robert Elliott4, John K. Olynky1,3
1Medicine and Pharmacology, University of Western Australia, Nedlands, WA, Australia. 2Gastroenterology, Fremantle Hospital, Fremantle, WA, Australia. 3Population Health, University of Western Australia, Nedlands, WA, Australia

#1140
ETHNIC AND GENDER DIFFERENCES IN LIVER HISTOLOGY IN OBESITY SURGERY PATIENTS
Eric R. Kallwitz, Grace Guzman, Veronica Tencate, Mrudula Kumar, Jamie L. Berkes, Joseph Vitello, Neelima Nadella, Roshan Patel, Thomas J. Layden, Scott Cotler
University of Illinois, Chicago, IL, USA

#1141
RETINOL-BINDING PROTEIN 4 IN SERUM AND LIVER TISSUE OF PATIENTS WITH NON ALCOHOLIC FATTY LIVER DISEASE. A NEW MEMBER OF ADIPOKINE FAMILY
John Kaskinas1, Maria J. Schina1,3, Emanuel K. Manesis1, Dina G. Tiniakos2, Emilia Hadziyannis1, Savvas Savvas1, Basilios Karanam1, Athanasios Archimandritis1
1Academic Department of Medicine, Medical School of Athens, Hippokration General Hospital, Athens, Greece. 2Histology Department, Medical School of Athens, Athens, Greece. 33rd Department of Internal Medicine, Evangelismos General Hospital, Athens, Greece

#1142
IMPACT OF NEW UPPER LIMITS OF NORMAL FOR ALANINE AMINOTRANSFERASE IN THE US POPULATION
W. Ray Kim1, Kiran Bambha2, Rachel A. Pedersen1, Nathan M. Bass2, Terry M. Therneau1
1Mayo Clinic College of Medicine, Rochester, MN, USA. 2UCSF, San Francisco, CA, USA

#1143
NON-ALCOHOLIC FATTY LIVER DISEASE IN CHINESE DOES LEAD TO PROGRESSIVE DISEASE
Chee-Kin Hui1, Nancy Leung2, Sik To Lai3, Jak-Yiu Lai3, Tony Shek4, Hung Yao5, Wai-Ki Li6, George K. Lau1
1Medicine, The University of Hong Kong, Hong Kong, China. 2Medicine, Alice Ho Miu Ling Hospital, Hong Kong, China. 3Medicine, Princess Margaret Hospital, Hong Kong, China. 4Pathology, The University of Hong Kong, Hong Kong, China. 5Pathology, Princess Margaret Hospital, Hong Kong, China. 6Surgery, The University of Hong Kong, Hong Kong, China

#1144
NON-ALCOHOLIC FATTY LIVER DISEASE IN NON-OBESE AMERICAN CHEMICAL WORKERS
Matthew C. Cave1, Arpana Mahalingashetty1, Rehan Khan1, Royce Grace1, Lark Reynolds1, Makunda Ray3, Craig J. McClain1,2
1Medicine/Gastroenterology, University of Louisville, Louisville, KY, USA. 2Louisville VAMC, Louisville, KY, USA. 3Pathology, University of Louisville, Louisville, KY, USA

#1145
A NEW APPROACH IN THE TREATMENT OF PATIENTS WITH NASH—RESULTS OF A PILOT STUDY
Adriana Popescu
Internal medicine, Fundeni Clinical Institute Bucharest, Bucharest, Romania

#1146
A NASH PREDICTIVE INDEX (NPI) FOR USE IN PATIENTS WITH NONALCOHOLIC FATTY LIVER DISEASE
Claudia O. Zein1, John M. Edmison2, Mark Schluchter3, Ariel E. Feldstein2, Nizar N. Zein2, Arthur J. McCullough2
1Gastroenterology and Hepatology, Case Western Reserve University, Cleveland, OH, USA. 2Division of Gastroenterology and Hepatology, Cleveland Clinic, Cleveland, OH, USA. 3Biostatistics and Epidemiology, Case Western Reserve University, Cleveland, OH, USA

#1147
PHOSPHOPROTEOMIC BIOMARKERS PREDICTING WEIGHT LOSS AFTER BARIATRIC SURGERY IN PATIENTS WITH NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD)
Valerie S. Calvert1,2, Clare Nugent1, Rochelle Collantes1,3, Hazem Elariny1, Arian Afndy1,3, Ancha Baranova1,2, Yun Fang1, Jianghong Deng1,2, Zachary Goodman4, Lance A. Liotta1,2, Emanuel F. Petricoin1,2, Zabair M. Younossi1,3
1Translational Research Institute, Inova Health System, Annandale, VA, USA. 2Center for Applied Proteomics and Molecular Medicine / Department of Molecular and Microbiology, George Mason University, Manassas, VA, USA. 3Center for Liver Diseases, Inova Health System - Inova Fairfax Hospital, Annandale, VA, USA. 4Armed Forces Institute of Pathology, Washington, DC, USA
#1148
NUTRITIONAL ASSESSMENT OF PATIENTS WITH NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD) AND CHRONIC VIRAL HEPATITIS
ChinHee Kim, Jillian B. Kallman, Ragini Srivastava, Ravindra Gupta, Arvind Murthy, Mary Ellen Sabatella, Lisa Pavloski, Zobair M. Younossi
Outcomes Research Program and the Center for Liver Disease, Inova Health System, Annandale, VA, USA

#1149
DIRECT COMPARISON OF TWO NON INVASIVE BIOMARKERS FOR THE DIAGNOSIS OF ADVANCED FIBROSIS IN PATIENTS WITH NON ALCOHOLIC FATTY LIVER DISEASE (NAFLD) : NAFLD SCORE AND FIBROTEST
Mona Munteanu1, Frederic Charlotte1, Vlad Ratziu1, Sophie Jacqueminet1, Djamilia Messous1, Philippe Podevin3, Laurence Sarfay1, Eric Bruckert1, Andre Grimal1, Thierry Poyard1
1APHP GIPS, Paris, France. 2Biopredictive, Paris, France. 3APHP Cochin, Paris, France. *APHP StAntoine, Paris, France

#1150
ROLE OF PHYSICAL ACTIVITY IN NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD): A POPULATION BASED STUDY
Shira Zelber Sag1, Dorit Nitzan-Kaluski2, Rebecca Goldsmith2, Muriel Webb1, Laurie M. Blends1, Zamir Halpern1,3, Ran Oren1,3
1Department of Gastroenterology, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel. 2The Food and Nutrition Administration, Ministry of Health, Tel Aviv, Israel. 3The Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel

#1151
SEVERITY OF NON-ALCOHOLIC FATTY LIVER DISEASE IS RELATED TO MTHFR 677C→T HOMOZYGOSITY, LOWER GLUTATHIONE AND INSULIN RESISTANCE
John M. Edmison, Srinivasan Dasarathy, Satish C. Kalhan, Arthur J. McCullough
Department of Gastroenterology and Hepatology, Cleveland Clinic, Cleveland, OH, USA

#1152
UPPER LIMIT OF NORMAL FOR ALANINE AMINOTRANSFERASE LEVEL IN KOREAN POPULATION: EFFECT OF BMI
Jae Keun Lee, Han Chu Lee, Koung Hoon Lee, Kang Mo Kim, Young Suk Lim, Young-Hwa Chung, Yung Sang Lee, Dong Jin Suh
Department of Internal Medicine, University of Ulsan College of Medicine, Asan Medical Center, Seoul, South Korea

#1153
VALIDATION OF THE “NAFLD FIBROSIS SCORE” IN PREDICTING ADVANCED FIBROSIS IN PATIENTS WITH HISTOLOGICALLY PROVEN NON-ALCOHOLIC FATTY LIVER DISEASE
Hellan Kang1, Jason Omo1, Greenson Joel2, Anna S. Lok1, Hari S. Conjeevaram1
1Gastroenterology, University of Michigan, Ann Arbor, MI, USA. 2Pathology, University of Michigan, Ann Arbor, MI, USA

#1154
ANGIOTENSIN II CAUSES PROGRESSIVE NONALCOHOLIC FATTY LIVER DISEASE MEDIATED BY OXIDATIVE STRESS IN THE REN-2 RAT MODEL
Yongzhong Wei1, Suzanne Clark1, E. M. Morris1, John Thyfault1, Grace Uptegrove1, Adam Whaley-Connel1, Carlos M. Ferriano2, James R. Sowers1, Jamil A. Ibdah1
1Gastroenterology, University of Missouri School of Medicine, Columbia, MO, USA. 2Physiology/Pharmacology, Wake Forest University School of Medicine, Winston-Salem, NC, USA

#1155
MONOCYTE CHEMOTACTIC PROTEIN-1 SECRETED BY ADIPOSE TISSUE INDUCES LIPID ACCUMULATION IN HEPATOCYTES
Sophie Clément, Cristiana Juge-Aubry, Stéphanie Conzelmann, Valeria Pazienza, Brigitte Pittet-Cuenod, Christoph Meier, Francesco Negro
University of Geneva, Geneva, Switzerland

#1156
THE ZEBRAFISH FOIE GRAS MUTANT IS A MODEL OF FATTY LIVER DISEASE WITH ACTIVATED UNFOLDED PROTEIN RESPONSE
Ayca Cinaroglu, Smita Gopinath, Katherine Krahn, Kirsten C. Sadler
Division of Liver Disease/Dept. of Medicine and Dept. of Molecular Cell and Developmental Biology, Mt. Sinai School of Medicine, New York, NY, USA

#1157
C-REACTIVE PROTEIN INDUCES INSULIN RESISTANCE IN BOTH HUMAN HEPATOCYTES AND ADIPOCYTES
Adeline Bertola2, Rodolphe Anty1,2, Stephanie Bonnafous2, Yannick Le Marchand-Brustel2, Albert Tran1,2, Philippe Gual2
1Pôle digestif, Centre Hospitalier universitaire, Nice, France. 2INSERM U568, Nice, France

#1158
MB07811, A HEPDIRECT PRODRUG OF A LIVER-TARGETED THYROID HORMONE RECEPTOR (TR) AGONIST, AND OTHER SYNTHETIC NON-LIVER-TARGETED TR AGONISTS, BUT NOT T3, REDUCE HEPATIC STEATOSIS
Edward E. Cable, Xiaohong Yang, Patricia D. Finn, Jian Li, Jeffery W. Stebbins, Michael P. Haughey, Jinzhao Hou, Bruce R. Ito, Paul D. van Poelje, David L. Linemeyer, Mark D. Erion
Metabasis Therapeutics, La Jolla, CA, USA

#1159
HOMOCYSTEINE SUPPLEMENTATION ATTENUATES, RATHER THAN INCREASES, THE UNFOLDED PROTEIN RESPONSE IN A MURINE NUTRITIONAL MODEL OF STEATOHEPATITIS
Anne S. Henkel, Richard M. Green
Medicine, Northwestern University Feinberg School of Medicine, Chicago, IL, USA
#1160
GENETIC EVIDENCE THAT LIPID TRAFFICKING PLAYS A KEY ROLE IN FIBROSIS IN NON ALCOHOLIC FATTY LIVER DISEASE
Nimantha M. De Alwis1, Ann K. Daly1, Guruprasad P. Aithal2, Elsbeth Henderson1, Julian Leathart1, Sushma Saksena1, Tom Shaw1, Christopher P. Day1
1Liver Group, Institute of Cellular Medicine, University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom. 2Liver Unit, Queens Medical Centre, Nottingham, United Kingdom

#1161
ALTERATIONS IN LYMPHOCYTE LIPID RAFT COMPOSITION AND STRUCTURE VIA BETAGLYCOLIPIDS IS ASSOCIATED WITH AMELIORATION OF NON ALCOHOLIC STEATOHEPATITIS: A NOVEL THERAPEUTIC TARGET FOR NASH
Gadi Lalazar, Ami Ben Ya’acov, Dan M. Livovsky, Ehud Zigmond, Yaron Ilan
Liver Unit, Hadassah Hebrew University Medical Center, Jerusalem, Israel

#1162
HIGH FAT DIET CHANGES EXPRESSION OF IRON RELATED MOLECULES IN MICE LIVER AND DUODENUM
Shigeki Miyoshi, Takaaki Ohtake, Masami Abe, Yasuaki Suzuki, Masumi Ohhira, Yutaka Kohgo
Department of Medicine, Asahikawa Medical College, Asahikawa, Japan

#1163
THE CAR AGONIST, TCPOBOP, ATTENUATES STEATOHEPATITIS IN THE MCD-FED MOUSE
Edwina S. Baskin-Bey, A. Anan, H. Isomoto, S. F. Bronk, Gregory J. Gores
Mayo Clinic College of Medicine, Rochester, MN, USA

#1164
ROLE OF VISCERAL FAT REMOVAL IN THE PREVENTION OF HEPATIC INSULIN RESISTANCE AND TRIGLYCERIDE ACCUMULATION IN RESPONSE TO HIGH FAT DIET IN VIVO
Sigal Fishman1,2, Radhika H. Muzumdar2, Francine H. Einstein2, Gil Azmon2, Nir Barzilai2
1Department of gastroenterology and hepatology, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel. 2Institute for Aging Research and Diabetes Research, Albert Einstein College of Medicine, Bronx, NY, USA

#1165
RESOLUTION OF HEPATIC STEATOSIS DESPITE PERSISTENT OBESITY IN MICE FED STANDARD RODENT CHOW AFTER INDUCTION OF TYPE 2 NAFLD USING THE AMERICAN DIET INDUCED OBESITY SYNDROME MODEL
Brent A. Neuschwander-Tetri1,3, Metin Basaranoglu1, Lisa M. Yerian4, Laura H. Tetri1, Elizabeth M. Brunton2,3
1Division of Gastroenterology and Hepatology, Saint Louis University, St. Louis, MO, USA. 2Dept of Pathology, Saint Louis University, St. Louis, MO, USA. 3Saint Louis University Liver Center, Saint Louis University, St. Louis, MO, USA. 4Dept of Pathology, Cleveland Clinic, Cleveland Clinic, Cleveland, OH, USA

#1166
THE DEVELOPMENT OF NEW DRUG SCREENING SYSTEM USING STEATOHEPATITIS MEDAKA FISH MODEL INDUCED BY HIGH-FAT DIET
Toshihiko Matsumoto1, Shuji Tera1, Shinya Kuwashira1, Koichi Fujisawa1, Naoki Yamamoto1, Yoshihiko Hamamoto2, Isao Sakaida1
1Department of Gastroenterology and Hepatology, Yamaguchi University Graduate School of Medicine, Ube, Yamaguchi, Japan. 2Department of Computer Science and Systems Engineering, Faculty of Engineering, Yamaguchi University, Ube, Yamaguchi, Japan

#1167
HYPOXIA WORSENS NON-ALCOHOLIC STEATOHEPATITIS
Piguet Anne-Christine1, Monika Ledermann1, Arthur Zimmermann2, Deborah Stroka2, Jean-François Dufour1
1Department of Clinical Pharmacology, University of Bern, Bern, Switzerland. 2Institute of Pathology, University of Bern, Bern, Switzerland. 3Department of Visceral Surgery and Transplantation, Inselspital, University of Bern, Bern, Switzerland

#1168
DISTINCT REQUIREMENT OF APOB-100 FOR INCREASED SECRETION OF VLDL-TRIGLYCERIDE IN RESPONSE TO HEPATIC OVEREXPRESSION OF MTP IN OB/OB MICE
Zhouji Chen, Elizabeth P. Newberry, Jin Y. Norris, Jianyang Luo, Susan M. Kennedy, Nicholas O. Davidson
Medicine, Washington University School of Medicine, St Louis, MO, USA

#1169
5-LIPOXYGENASE INHIBITION ABROGATES HEPATIC STEATOSIS BY REDUCING LIVER FATTY ACID-BINDING PROTEIN EXPRESSION AND INCREASING HEPATOCYTE MICROSONAL TRIGLYCERIDE TRANSFER PROTEIN ACTIVITY
Marta López-Parra1, Esther Titos1, Raquel Horrillo1, Natalia Ferré1, Marcos Martinez-Clemente1, Ana González-Pérez1, Anna Planagumà1, Jaime Masferrer2, Vicente Arroyo2, Juan Rodes2, Joan Clària1
1Department of Biochemistry and Molecular Genetics, Hospital Clinic, Centro de Investigación Biomédica Esther Koplowitz (CIBEK), IDIBAPS, University of Barcelona, Barcelona, Spain. 2Liver Unit, Hospital Clinic, Centro de Investigación Biomédica Esther Koplowitz (CIBEK), IDIBAPS, University of Barcelona, Barcelona, Spain. 3Pfizer, Research and Development, St Louis, MO, USA
#1170

DAILY EXERCISE INCREASES HEPATIC FATTY ACID OXIDATION AND PREVENTS STEATOSIS IN OTSUCA LONG-EVANS TOKUSHIMA FATTY (OLETF) RATS

R. Scott Rector1, John Thyfault1,2, R. Tyler Morris5, Matthew Laye5, Sarah J. Borengeass3, Frank Booth4,5, Jamal A. Ibdah1,2
1Gastroenterology, University of Missouri School of Medicine, Columbia, MO, USA. 2Research, Harry S. Truman Veterans Medical Center, Columbia, MO, USA. 3Nutritional Science, University of Missouri-Columbia, Columbia, MO, USA. 4Biomedical Sciences, University of Missouri-Columbia, Columbia, MO, USA. 5Medical Pharmacology and Physiology, University of Missouri-Columbia, Columbia, MO, USA

#1176

STUDY OF THE MITOCHONDRIAL COMPLEX I BY BLUE NATIVE ELECTROPHORESIS IN LEAN AND OB/OB MICE

Inmaculada García-Ruiz2, Cristina Rodriguez-Juan5, Teresa Díaz Sanjuan2, Daniel Fernández-Moreira2, Mercedes Pérez-Carreras1, Teresa Muñoz-Yagüe1, Jose A. Solis-Herruzo1,2
1Gastroenterology, Hospital Universitario “12 de Octubre”, Madrid, Spain. 2Research Center, Hospital Universitario “12 de Octubre”, Madrid, Spain

#1171

PHYLLANTHUS URINARIA AMELIORATES THE SEVERITY OF NUTRITIONAL STEATOHEPATITIS

Bo Shen, Jun Yu, Shiyuan Wang, Eagle SH Chu, Vincent WS Wong, Xin Zhou, Ge Lin, Joseph JY Sung, Henry LY Chan
The Chinese University of Hong Kong, Hong Kong, China

#1172

OXIDATIVE STRESS-RELATED DAMAGE IS IMPLICATED IN LPS-INDUCED ACTIVATION OF HEPATIC STELLATE CELLS

Paola Brun1,2, Melania Scarpa1,2, Alessia Grillo1,2, Federica Ditadi2, Giorgio Palù2, Diego Martines1, Ignazio Castaglione2
1Surgical and Gastroenterological Sciences, University of Padova, Padova, Italy. 2Department of Histology, Microbiology and Medical Biotechnologies, University of Padua, Padova, Italy

#1173

PIOGLITAZONE RESTORES REGENERATION FAILURE FOLLOWING PARTIAL HEPATECTOMY IN OBSE & DIABETIC KK-AY MICE

Tomonori Aoyama, Kenichi Ikejima, Kazuyoshi Kon, Kyoko Okumura, Kumiko Arai, Sumio Watanabe
Department of Gastroenterology, Juntendo University, Tokyo, Japan

#1174

MECHANISM OF SERUM ALT INCREASE IN EXPERIMENTAL NASH

Rui Liu, Xiaomin Pan, Peter F. Whittington
Children’s Memorial Research Center, Chicago, IL, USA

#1175

THE MITOCHONDRIAL SUPEROXIDE DISMUTASE 2 (SOD2) TARGETING SEQUENCE POLYMORPHISM IS ASSOCIATED WITH FIBROTIC NAFLD: CONSISTENT EVIDENCE FROM CASE-CONTROL AND INTRA-FAMILIAL ALLELIC ASSOCIATION STUDIES

V. Nobile2, Ann K. Daly1, A. Al-Serri1, M. Marcellini2, A. Alisi2, M. Manco2, Julian Leatham1, J. Graham1, Christopher P. Day1
1Liver Group, Institute of Cellular Medicine, University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom. 2Liver Unit, Bambino Gesu’ Hospital, Rome, Italy

#1177

TRB3 IS ASSOCIATED WITH HEPATIC LIPGENESIS AND DYSLIPIDEMIA IN NAFLD

Luca Valenti1, Raffaela Rametta1, Paola Dongiovanni1, Anna Ludovica Fracanzani1, Giancarlo Rovira2, Silvia Fargion1
1Internal Medicine, University of Milan, Ospedale Policlinico IRCCS, Milano, Italy. 2Surgery, University of Milan, Ospedale Policlinico Mangiagalli Regina Elena IRCCS, Milano, Italy

#1178

HEPATIC ADIPOR2 SIGNALING REGULATES THE DEVELOPMENT OF NONALCOHOLIC STEATOHEPATITIS IN MICE

Kengo Tomita1, Yuichi Oike4, Terufumi Yokoyama2, Takashi Taguchi1, Shinobu Tanaka2, Masaki Naguchi2, Toshiaki Teranishi1, Takahiro Suzuki1, Hirokazu Yokoyama3, Mitsuhisa Tabata4, Tamiko Ohkura2, Toshifumi Hibi1
1Department of Internal Medicine, Keio University School of Medicine, Tokyo, Japan. 2Institute for Advanced Medical Research, Keio University School of Medicine, Tokyo, Japan. 3Health Center, Keio University School of Medicine, Tokyo, Japan. 4Department of Molecular Genetics, Graduate School of Medical Sciences, Kumamoto University, Kumamoto, Japan

#1179

PREVENTION OF HEPATIC FIBROSIS IN A MURINE MODEL OF METABOLIC SYNDROME WITH NON-ALCOHOLIC STEATOHEPATITIS (NASH)

Laurie D. DeLeve1, Xiangdong Wang1, Gary C. Kanel2, Roscoe Atkinson2, Robert S. McCuskey3
1Div of GI/Liver Diseases and Research Center for Liver Diseases, USC Keck School of Medicine, Los Angeles, CA, USA. 2Department of Pathology, USC Keck School of Medicine, Los Angeles, CA, USA. 3Department of Cell Biology and Anatomy, University of Arizona, Tucson, AZ, USA

#1180

HEPATOCELLULAR SPECIFIC GP130 PROTECTS AGAINST THE DEVELOPMENT AND PROGRESSION OF STEATOHEPATITIS

Daniela Kroy1, Naiara Beraza1, Uta Dierssen1, Leif Sander1, Werner Plum1, Nikolaus Gassler2, Christian Trautwein1, Konrad L. Streitz1
1Department of Medicine III, RWTH Aachen, Aachen, Germany. 2Department of pathology, RWTH Aachen, Aachen, Germany
#1181
NOVEL THERAPEUTIC APPROACH FOR NAFLD USING ANTIPLATELET AGENTS IN AN ANIMAL MODEL
Koji Fujita, Masato Yoneda, Yuichi Nozaki, Hiroshi Iida, Takuma Higurashi, Hironori Mawatari, Hiroki Endo, Ayako Tomimoto, Kyoto Yoneda, Tomoyuki Akiyama, Hirokazu Takahashi, Ayumu Goto, Satoru Hirokawa, Yasunobu Abe, Masahiko Inamori, Noritoshi Kobayashi, Hiroyuki Kirikoshi, Kenseke Kubota, Satoru Saito, Atsushi Nakajima gastroenterology, Yokohama-city university graduate school of medicine, Yokohama, Japan

#1182
ENDOCANNABINOID PRODUCTION BY MONOCYTES IS INCREASED IN NONALCOHOLIC STEATOHEPATITIS
Onpan Cheung1, Carol C. Sargeant1, Vincenzo Di Marzo2, Puneet Puri1, Faridoddin Mirshahi1, Arun J. Sanyal1
1Gastroenterology, Hepatology and Nutrition, Medical College of Virginia, Richmond, VA, USA. 2Istituto di Chimica Biomolecolare, Pozzuoli (NA), Italy

#1183
THE TRADITIONAL JAPANESE KAMPO FORMULA KEISHIBUKURYOGAN AMELIORATES STEATOSIS, REDUCES OXIDATIVE STRESS AND INFLAMMATION, AND ULTIMATELY PREVENTS LIVER FIBROSIS IN A RABBIT MODEL OF NON ALCOHOLIC STEATOHEPATITIS
Makoto Fujimoto1,2, Koichi Tsuneyama2,3, Masaburo Kainuma4, Nobuyasu Sekiya5, Yasuo Takano6, Katsutoshi Terasawa3,6, Carlo Selmi7,8, M. Eric Gershwin7, Yutaka Shimada1,3
1Japanese Oriental Medicine, University of Toyama, Toyama, Japan. 2Diagnostic Pathology, University of Toyama, Toyama, Japan. 321st Century COE Program, University of Toyama, Toyama, Japan. 4Environmental Medicine and Infectious Diseases, Kyushu University, Fukuoka, Japan. 5Frontier Japanese Oriental Medicine, Chiba University, Chiba, Japan. 6Japanese Oriental Medicine, Chiba University, Chiba, Japan. 7Internal Medicine, University of California, Davis, Davis, CA, USA. 8Clinical Sciences ‘Luigi Sacco’, University of Milan, Milan, Italy

#1184
PALMITATE-INDUCED LIPID ACCUMULATION IN HEPATOCYTES LEADS TO ACTIVATION AND PRO-FIBROTIC GENE EXPRESSION IN HEPATIC STELLATE CELLS – A NEW IN VITRO MODEL TO STUDY FIBROGENESIS IN NASH
Hella Wobser1, Christoph Dorn1, Thoams Weiss2, Roland Buettnner1, Cornelius Bollheimer1, Juergen Schoelmerich1, Claus Hellingbrand1
1Department of Medicine, University Clinics, Regensburg, Germany. 2Department of Surgery, University Clinic, Regensburg, Germany

#1185
DIETARY CONSTITUENTS IN MICE ARE REFLECTED IN THE HEPATIC LIPID PROFILE AS DETECTED BY CARBON-13 MAGIC ANGLE SPINNING MAGNETIC RESONANCE SPECTROSCOPY
Jeremy F. Cobbold1, Suchitra Chinthapalli1, Quentin Anstee1, Robert D. Goldin2, Roger Cox3, Mark R. Thursz1, Howard C. Thomas1, Simon D. Taylor-Robinson1, J. C. Cox4
1Medicine, Imperial College London, London, United Kingdom. 2Investigative Sciences, Imperial College London, London, United Kingdom. 3Mammalian Genetics, Medical Research Council Harwell, Harwell, United Kingdom. 4Imaging Sciences, Imperial College London, London, United Kingdom

#1186
ADENOVIRUS-MEDIATED TRANSFER AND INDUCTION OF HEPATIC HEME OXYGENASE-1 IN THE LIVER PROTECTS AGAINST STEATOHEPATITIS IN VITRO AND IN VIVO
Jun Yu, Eagle SH Chu, Ruizhi Wang, Chung W Wu, Yim P Wong, Enders KW Ng, Henry LY Chan, Joseph JY Sung The Chinese University of Hong Kong, Hong Kong, China

#1187
DELAYED LIVER REGENERATION AND IMPAIRED FATTY ACID METABOLISM IN ADIPOPOETIN KNOCKOUT MICE AFTER PARTIAL HEPATECTOMY
Hisao Ezaki1, Yukiko Saji1, Yuichi Yoshida1, Shinichi Kiso1, Yoshihiro Kamada1, Hitoshi Matsumoto1, Juichi Fukushima1, Akira Wada1, Shinji Kihara2, Tohru Funahashi3, Ichiro Shimomura4, Shinji Tamura1, Norio Hayashi1
1Department of Gastroenterology and Hepatology, Osaka university, Suita, Japan. 2Department of Metabolic Medicine, Osaka university, Suita, Japan

#1188
GREEN TEA POLYPHENOLS IMPROVE LIVER INJURY OF NONALCOHOLIC STEATOHEPATITIS (NASH) MODEL MICE EXPRESSING NUCLEAR STEROL REGULATORY ELEMENT-BINDING PROTEIN 1C (NSREBP-1C) IN ADIPOSE TISSUE
Takato Ueno1,2, Toru Nakamura2,1, Ryuichiro Sakata2,1, Osamu Hashimoto2,1, Kinya Inoue2,1, Hiromi Koga2,1, Takui Torigura2,1, Masako Shinkawa1, Hitomi Nakayama2, Syuichi Otabe2, Naotoshi Hitori3, Kentaro Yamada2, Michio Sata2,1
1Research Center for Innovative Cancer Therapy and Center of the 21st Century COE Program for Medical Science, kurume University, Kurume, Japan. 2Division of Gastroenterology, Department of Medicine, Kurume University School of Medicine, Kurume, Japan. 3Division of Endocrinology and Metabolism, Department of Medicine, kurume University School of Medicine, Kurume, Japan

#1189
TRANS-FATTY ACID POTENTIATES ACCUMULATION OF TRIGLYCERIDE AND SUSCEPTIBILITY TO OXIDATIVE STRESS IN HEPATOCYTES
Kazuyoshi Kon, Kenichi Ikejima, Tomonori Aoyama, Kyoko Okumura, Kumiko Arai, Sumio Watanabe Gastroenterology, Juntendo University, Tokyo, Japan
#1190
LOSS OF β-CATENIN EXACERBATES MEHIONINE-CHOLINE-DEFICIENT DIET INDUCED STEATOHEPATITIS IN MICE
Jaideep Behari1, Wade Otruba1, Benjamin Cieply2, Udayan Apte2, Tong Wu2, Satdarshan P. Monga1,2
1Department of Medicine, University of Pittsburgh, Pittsburgh, PA, USA. 2Department of Pathology, University of Pittsburgh, Pittsburgh, PA, USA

#1191
DIETARY ZINC SUPPLEMENTATION REVERSES ALCOHOLIC FATTY LIVER IN THE PRESENCE OF CHRONIC ALCOHOLIC ADMINISTRATION
Zhanxiang Zhou, Xinqin Kang, Zhenyuan Song, Craig J. McClain, Y. James Kang
University of Louisville, Louisville, KY, USA
Cell and Molecular Biology

#1192
CAVEOLIN-1 UPREGULATES ENDOTHELIAL CAPILLARY-LIKE TUBULAR FORMATION AND FENESTRAL CONTRACTION IN ASSOCIATION WITH RHO GTPASES IN SINUSOIDAL ENDOTHELIAL CELLS

Hiroaki Yokomori¹, Masaya Oda², Toshifumi Hibi³
¹Internal Medicine, Kitasato Medical Center Hospital, Saitama, Japan. ²Organized Center of Clinical Medicine, International University of Health and Welfare, Tokyo, Japan. ³Internal Medicine, School of Medicine, Keio University, Tokyo, Japan

#1193
ROLE OF THE N-TERMINAL SEQUENCE OF BSEP (ABCB11) IN PROTEIN TRAFFICKING AND STABILITY

Claire L. Pearson, Ping Lam, James L. Boyer
Internal Med., Yale University, New Haven, CT, USA

#1194
LIVER CELL VOLUME REGULATION AND ATP RELEASE REQUIRE INTACT VESICULAR TRAFFICKING PATHWAYS

Meghana N. Sathe¹, Andrew P. Feranchak¹, J. Gregory Fitz², Charles Kresge¹
¹Pediatrics, UTSW, Dallas, TX, USA. ²Internal Medicine, UTSW, Dallas, TX, USA

#1195
THE SORTING OF ENDOCYTIC PROTEIN ALONG ACTIN AND MICROTUBULES IN THE HEPATOCYTE

Souvik Sarkar, Allan W. Wolkoff, John W. Murray
Liver Research Center, Albert Einstein College of Medicine, Bronx, NY, USA

#1196
PROTEOMIC AND IMMUNOFLOUORESCENCE ANALYSIS OF EARLY AND LATE ENDOCYTIC VESICLES ISOLATED FROM RAT HEPATOCYTES

Subhajit Mukherjee¹,², Jean J. Wang³, Fa-Yun Che³, Kristie Gordon³, Linda Siconolfi-Baez⁴, Edward Nieves⁴, Ruth H. Angeletti⁵, John W. Murray¹,², Allan W. Wolkoff¹,²

#1201
HEPATIC STEATOSIS AND GLOMERULAR DISEASE IN MICE WITH C-TERMINALLY TRUNCATED GP73 (GOLPH2)
Lorinda M. Wright1,2, Maria Picken3, Sherri Yong3, Don C. Rockey4, Scherazade Nisar2, Claus J. Fimmel1,2
1Division of Gastroenterology, Hepatology and Nutrition, Loyola University, Chicago, IL, USA. 2Research (151), Hines VA Hospital, Hines, IL, USA. 3Department of Pathology, Loyola University, Stritch School of Medicine, Chicago, IL, USA. 4Internal Medicine, Digestive & Liver Diseases, UT Southwestern Medical Center, Dallas, TX, USA

#1202
PRIMARY HUMAN HEPATOCYTES UNDERGO DNA SYNTHESIS IN RESPONSE TO ENGINEERED FORMS OF HEPATOCYTE GROWTH FACTOR (HGF/SF): A PRE-REQUISITE TO USING HGF ANALOGUES CLINICALLY
Clare Selden1, Myrddin Rees3, Jennifer Mann1, Humphrey J. Hodgson1, Ermanno Gherardi2
1Centre for Hepatology at the Royal Free, Royal Free & University College Medical School, London, United Kingdom. 2Medical School, University of Cambridge, Cambridge, United Kingdom. 3Dept of Surgery, North Hampshire Hospital, Basingstoke, United Kingdom

#1203
THE ROLES OF LYSOSOMAL PROTEINASES IN PRIMARY HEPATOCYTE DEATH INDUCED BY TNF-α AND ACTINOMYCIN D
Noriyuki Yamamura1, Toshirou Nishida1, Kiyokazu Nakajima1, Masahiro Shibata2, Masato Kakei2, Yoshiki Sawa1, Yasuo Uchiyama2
1Surgery, Osaka University Graduate School of Medicine, Suita, Japan. 2Cell Biology and Neurosciences, Osaka University Graduate School of Medicine, Suita, Japan

#1204
NATURAL POLYMORPHISM OF NS3 PROTEASE DOMAIN STRAINS HCV-1 IN HCV AND HIV-HCV COINFECTED PATIENTS: VIROLOGICAL AND CLINICAL IMPLICATION FOR DRUG RESISTANT VIRUSES
Philippe Halffon1, Hawwa Dia1, Philippe Benech2, Patrick Philipbert3, Agnès Martineau1, Guillaume Pénaranda4, Jérôme Courcambeck2, Mourad Bouzidi2, Hacène Khiri1
1Laboratoire Alphabio, Marseille, France. 2Genoscience, Marseille, France. 3Hôpital Ambroise Paré, Marseille, France. 4CDL Pharma, Marseille, France

#1205
MICROENVIRONMENTAL REGULATION OF SINUSOIDAL ENDOTHELIAL CELL PHENOTYPE
Sandra March1, Elliot E. Hui1, Sangeeta N. Bhatia1,2
1Health Sciences and Technology / Electrical Engineering and Computer Science, Massachusetts Institute of Technology, Cambridge, MA, USA. 2Medicine, Brigham and Women’s Hospital, Boston, MA, USA

#1206
DEVELOPMENT AND CHARACTERIZATION OF MICROSCALE MODELS OF RAT AND HUMAN LIVERS
Salman Khetani1, Sangeeta N. Bhatia1,2
1Health Sciences and Technology / Electrical Engineering and Computer Science, Massachusetts Institute of Technology, Cambridge, MA, USA. 2Medicine, Brigham and Women’s Hospital, Boston, MA, USA

#1207
SWELLING-INDUCED TRAFFICKING OF ACTIN-COATED VESICLES AND CONTROL OF HEPATOCYTOPLASMIC VOLUME REGULATION BY MYOSIN LIGHT CHAIN KINASE
Elisabeth T. Barford1, Ann L. Moore2, Steven D. Lidofsky1,2
1Pharmacology, University of Vermont, Burlington, VT, USA. 2Medicine, University of Vermont, Burlington, VT, USA

#1208
OVEREXPRESSION OF CYP2E1 IN LIVER INCREASES INSULIN RESISTANCE AND INHIBITS INSULIN SIGNALING IN AN ANIMAL MODEL OF NASH
Elango Kathirvel1,2, Philip T. Chen2, Kengathey Morgan1,2, Samuel W. French3, Timothy R. Morgan1,2
1Department of Medicine/Gastroenterology, VA Long Beach Healthcare System, Long Beach, CA, USA. 2Medicine, University of California, Orange, CA, USA. 3Pathology, Harbor-UCLA Medical Center, Torrance, CA, USA

#1209
POST-TRANSLATIONAL MODIFICATION OF HEPATIC SCAVENGER RECEPTOR CLASS B, TYPE I AND CHYLOMICRON METABOLISM IN A MOUSE MODEL
Tao Fu1, Marc S. Elias1, Nishath Quader1, Jayme Borensztajn2
1Medicine/Hepatology, Northwestern University, Chicago, IL, USA. 2Pathology, Northwestern University, Chicago, IL, USA

#1210
WNT11 INHIBITS THE CANONICAL WNT PATHWAY THROUGH THE PKC-MEDIATED β-CATENIN PHOSPHORYLATION IN HUMAN HEPATOMA CELLS
Takashi Toyama, Han Chu Lee, Jack R. Wands, Miran Kim
Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI, USA

#1211
NEGATIVE FEEDBACK REGULATION OF β-CATENIN SIGNALING BY THE MICROENVIRONMENT THROUGH A FRIZZLED-LIKE MODULE IN THE EXTRACELLULAR MATRIX OF HEPATOCELLULAR CARCINOMA
Orlando Musso1, Ismail Hendauoui1, Elise Lavergne1, Harri Elamaa2, Nathalie Theret1, Delphine Quelard1, Bruno Turlin1, Taina Pihlajaaniemi2, Bruno Clement1
1INSERM U620, Rennes, France. 2MEDICAL BIOCHEMISTRY, UNIVERSITY OF OULU, OULU, Finland
#1212
INACTIVATION OF CASPASE-8 AFFECTS HEPATOCYTE PROLIFERATION AFTER PARTIAL HEPATECTOMY IN MICE
Julia Freimuth1, Dieter Riethmacher2, Christian Trautwein1, Christian Liedtke1
1Medicine III, University Hospital Aachen, Aachen, Germany. 2Centre for Molecular Neurobiology, Hamburg, Germany

#1213
IGF-II IS A GROWTH FACTOR TO HEPATOBLASTOMA AND HEPATOCELLULAR CARCINOMA VIA PHOSPHATIDYL INOSITOL 3 KINASE AS A TARGET OF MOLECULAR THERAPY
Minoru Tomizawa, Osamu Yokosuka
Department of Medicine and Clinical Oncology, Chiba University Graduate School of Medicine, Chiba City, Japan

#1214
PTEN ASSOCIATION WITH P13Kα SUBUNIT IS A NEGATIVE REGULATORY MECHANISM FOR INSULIN SIGNALING IN THE LIVER
Jiman He, Suzanne de la Monte, Jack R. Wands
Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI, USA

#1215
FARNESOID X RECEPTOR (FXR) REGULATES RECK EXPRESSION
Helen B. Hartman1, Wenyan Zhong2, Douglas C. Harnish1, Paige E. Mahaney3, Mark J. Evans1
1Cardiovascular and Metabolic Diseases Research, Wyeth, Collegeville, PA, USA. 2Biological Technologies, Wyeth, Collegeville, PA, USA. 3Chemical and Screening Sciences, Wyeth, Collegeville, PA, USA

#1216
Marco Breinig, Peter Schirmacher, Michael A. Kern
Department of General Pathology, University Hospital Heidelberg, Heidelberg, Germany

#1217
CONDITIONAL ABLATION OF C-FLIP RENDERS HEPATOCYTE MORE SENSITIVE TOWARDS CD95 MEDIATED APOPTOSIS IN VIVO
Marcus Schuchmann1, Daniel Sammet1, Jörn M. Schattenberg1, Jürgen Siebler1, You-Wen He2, Peter R. Galle1
1Department of Medicine, University of Mainz, Mainz, Germany. 2Department of Immunology, Dukes University, Durham, NC, USA

#1218
MICRONRNA-370 REGULATES INTERLEUKIN-6 DEPENDENT P38 MAP KINASE SIGNALING IN HUMAN CHOLANGIOCARCINOMA
Fanyin Meng1,2, Hania Wehbe-Janek2, Roger Henson2, Heather Smith2, Tushar Patel1,2
1Department of Internal Medicine, Ohio State University Medical Center, Columbus, OH, USA. 2Scott & White Clinic, Temple, TX, USA

#1219
IL-22 MAY BE INVOLVED IN LIVER REGENERATION VIA A STAT-3 SIGNALING PATHWAY AFTER 70% HEPATECTOMY
Xiaodan Ren, Lisa Colletti
Department of Surgery, University of Michigan, Ann Arbor, MI, USA

#1220
DIFFERENTIAL EXPRESSION OF DISCOID DOMAIN RECEPTORS IN EPITHELIAL-MESENCHYMAL TRANSITION
Hironori Koga1, Michiko Maeyama1, Sivakumar Ramadoss1, Selvendran Karuppiah2, Takaumi Yoshida1, Osamu Hashimoto1, Mitsuhiko Abe1, Chikatomi Yanagimoto1, Hiroti Kummur1, Shinichiro Hanada1, Eitaro Taniguchi1, Takumi Kawaguchi1, Masaru Harada1, Takuji Torimura1, Hirohisa Yano3, Takato Ueno4, Michio Sata1
1Division of Gastroenterology, Department of Medicine, Kurume University, Kurume, Japan. 2Dorothy M. Davis Heart and Lung Research Institute, The Ohio State University Medical Center, Columbus, OH, USA. 3Department of Pathology, Kurume University, Kurume, Japan. 4Research Center for Innovative Cancer Therapy, Kurume University, Kurume, Japan

#1221
PS3 IS A SPECIFIC MOLECULAR TARGET OF URSEDOXYCHOLIC ACID IN REGULATING APOPTOSIS
Joana D. Amaral1, Rui E. Castro1, Susana Solá1, Clifford J. Steer2,3, Cecilia Maria P. Rodrigues1
1iMed.UF, Faculty of Pharmacy, University of Lisbon, Lisbon, Portugal. 2Department of Medicine, University of Minnesota Medical School, Minneapolis, MN, USA. 3Department of Genetics, Cell Biology and Development, University of Minnesota Medical School, Minneapolis, MN, USA

#1222
HEPATIC STAT3 ATTENUATES SYSTEMIC INFLAMMATORY RESPONSE AND LETHALITY IN SEPTIC MICE
Ryoitaro Sakamori, Tetsuo Takehara, Hayato Hikita, Akira Sasakawa, Keisuke Kohga, Akio Uemura, Shinjiro Yamaguchi, Tomohide Tatsuki, Kazuyoshi Ohkawa, Norio Hayashi
Gastroenterology and Hepatology, Osaka University, Graduate School of Medicine, Suita, Japan
#1223
**DISRUPTED CELL ADHESION BUT NOT PROLIFERATION OR ANTI-APOPTOSIS MEDIATES POLYCYSTIC LIVER DISEASE**

Esmé Waanders¹, Cathy N. Maass², René H. te Morsche¹, Erwin H. van Geffen³, Han J. van Krieken², Joost P. Drenth¹

¹Department of Gastroenterology and Hepatology, Radboud University Nijmegen Medical Center, Nijmegen, Netherlands. ²Department of Pathology, Radboud University Nijmegen Medical Center, Nijmegen, Netherlands. ³Department of Surgery, Jeroen Bosch Hospital, Den Bosch, Netherlands

#1224
**GP130-STAT3-DEPENDENT SOCS3 INDUCTION CONTROLS TIMING OF HEPATOCYTE PROLIFERATION DURING LIVER REGENERATION**

Uta Dierssen¹, Naiara Beraza¹, Matthias Ernst³, Christian Trautwein¹

¹Internal Medicine III, University Hospital, RWTH Aachen, Aachen, Germany. ²Internal Medicine III, University Hospital, RWTH Aachen, Aachen, Germany. ³Colon Molecular and Cell Biology Laboratory, Ludwig Institute for Cancer Research, Parkville VIC 3050, VIC, Australia

#1225
**LIVER TETRAPLOIDIZATION IS TRIGGERED BY WEANING UNDER AN INSULIN SIGNAL**

Séverine Morizur, Germain Margall-Ducos, Dominique Couton, Chantal Desdouets

Genetic and Development, Institut Cochin - INSERM 567, Paris, France

#1226
**MOLECULAR MECHANISMS OF ANTI-APOPTOTIC AND ANTI-OXIDANT EFFECTS OF GRAPE AND ITS COMPOUNDS**

Jing Yu¹, Yumin Xu¹, Zhongying Bao¹, Vladimir Khaoustov¹,², Boris Yoffe¹,²

¹Baylor College of Medicine, Houston, TX, USA. ²Michael E. Debakey VAMC, Houston, TX, USA

#1227
**EXPRESSION AND LOCALIZATION OF ATYPICAL PKC ISOFORMS IN LIVER PARENCHYMAL CELLS**

Claudia Stross, Verena Keitel, Ralf Kubitz, Dieter Häussinger

Klinik für Gastroenterologie, Hepatologie und Infektiologie, Heinrich Heine Universität Düsseldorf, Düsseldorf, Germany

#1228
**ESTROGEN RECEPTORS ACTIVATE THE EXPRESSION OF THE HUMAN ENTEROHEPATIC TRANSPORTER GENES SLC10A2 AND SLC01B1 BY ENHANCING THE DNA-BINDING OF HNF-1α**

Jyrki J. Eloranta, Christian Hiller, Gerd A. Kullak-Ublick

Division of Clinical Pharmacology and Toxicology, University Hospital Zurich, Zurich, Switzerland

#1229
**S6K1 INHIBITION BY A NOVEL CLASS OF DITHIOLETHIONES ABROGATES INSULIN RESISTANCE INDUCED BY HYPEROSMOTIC STRESS**

Eun Ju Bae, Yoon Mi Yang, Sang Geon Kim

College of Pharmacy, Seoul National Univ., Seoul, South Korea

#1230
**ADAM17 PROMOTES ERK-MEDIATED PHOSPHORYLATION OF SER112 IN BAD**

Katsuhiro Senda, Haruhisa Nakao, Shunsuke Nojiri, Takashi Joh, Tomokatsu Miyaki

Department of Gastroenterology and Metabolism, Nagoya City University, Nagoya, Japan

#1231
**OVEREXPRESSION OF THE LIVER TRANSCRIPTION FACTOR HNF6 ACCELERATES HEPATOCYTE PROLIFERATION DURING MOUSE LIVER REGENERATION**

Yuichi Yoshida¹, Yongjun Tan², Douglas E. Hughes³, Shinji Tamura¹, Norio Hayashi¹

¹Department of Gastroenterology and Hepatology, Osaka University, Suita, Osaka, Japan. ²The Biomedical Engineering Center, Hunan University, Yuelu District, China. ³Departments of Biochemistry and Molecular Genetics, University of Illinois at Chicago, College of Medicine, Chicago, IL, USA

#1232
**THE HUMAN SMALL HETERODIMER PARTNER (SHP) PROMOTER CONTAINS INDEPENDENT AND UNCONVENTIONAL 9-CIS RETINOIC ACID- AND BILE SALT-RESPONSIVE ELEMENTS**

Martijn O. Hoeke, Janette Heegsma, Klaas Nico Faber

Department of Gastroenterology and Hepatology, University Medical Center Groningen, University of Groningen, Groningen, Netherlands

#1233
**ROLE OF FARNESOID X RECEPTOR IN REGULATING HEPATIC LIPID HOMEOSTASIS**

Bo Kong, Nariko Esterly, Manimaran Rengasamy, Grace Guo

Department of Pharmacology, Toxicology and Therapeutics, University of Kansas Medical Center, Kansas City, KS, USA

#1234
**HOMOCYSTEINE-INDUCED INHIBITORY EFFECTS ON ADIPONECTIN PRODUCTION IN ALCOHOLIC LIVER DISEASE**

Zhenyuan Song¹, Zhanxiang Zhou¹, Ion V. Deaciuc¹, Theresa S. Chen¹, Craig J. McClain¹,²

¹Medicine/Gastroenterology, University of Louisville, Louisville, KY, USA. ²Louisville VAMC, Louisville, KY, USA
#1235
PROTEIN KINASE C REGULATES H2O2-INDUCED HEPATOCYTES NECROSIS BY SUPPRESSION OF PROTECTIVE SIGNALING VIA AMP ACTIVATED KINASE AND AKT
Saberi Behnam1, Mie Shinohara1, Naoko Hanawa1, William A. Gaarde2, Derick Han1, Neil Kaplowitz1
1GI/Liver, USC, Los Angeles, CA, USA. 2Isis Pharmaceuticals, San Diego, CA, USA

#1236
ALTERING TRANSPLANTED CELL ENGRAFTMENT AND PROLIFERATION IN THE LIVER THROUGH PARACRINE SIGNALING WITH COTRANSPLANTATION OF LIVER SINUSOIDAL ENDOTHELIAL CELLS (LSEC) AND HEPATOCYTES IN MICE
Antonia Follenzi1,2, Ekaterine Berishvili1, Brigid Joseph1, Simone Merlin1, Sanjeev Gupta1
1Marion Bessin Liver Research center, Albert Einstein college of Medicine, Bronx, NY, USA. 2Medical Sciences, Universita’ del Piemonte Orientale, Novara, Italy

#1237
USEFULNESS OF ONCOSTATIN M GENE THERAPY ON LIVER DAMAGE INDUCED BY DIMETHYLNITROSAMINE IN RATS
Tetsuhiro Hamada1,2, Ayuko Sato2, Ikuko Torii2, Jiro Fujimoto1, Tohru Tsujimura2
1Surgery, Hyogo college of medicine, Nishinomiya, Japan. 2Pathology, Hyogo college of medicine, Nishinomiya, Japan

#1238
SEROTONIN 2B RECEPTOR SIGNALING: A NOVEL NEGATIVE REGULATOR OF LIVER GROWTH
Mohammad R Ebrahimkhani1, Luc Maroteaux2, Fiona Oakley1, Derek A Mann1
1Liver Research Group, Institute of Cellular Medicine, School of Clinical Medical Sciences, University of Newcastle upon Tyne, Newcastle upon Tyne, United Kingdom. 2Developmental of Neurobiology INSERM U616, Hôpital Pitié-Salpetrière, Paris, France

#1239
THE SODIUM-COUPLED NEUTRAL AMINO ACID TRANSPORTER (SNAT) 4 IS EXPRESSED IN DEVELOPING MOUSE LIVER AND REGULATED BY HEPATOCYTE NUCLEAR FACTOR (HNF) 4ɑ
Hiroki Kondou1, Masayo Yamagata1,2, Kanako Tachikawa1, Toshimi Michigami1
1Department of Bone and Mineral Research, Research Institute, Osaka Medical Center for Maternal and Child Health, Osaka, Japan. 2Laboratory of Clinical Pharmacology, Osaka Ohtani University, Osaka, Japan

#1240
MONOCYTE CHEMOATTRACTANT PROTEIN-1 ENHANCED ANTITUMOR EFFECTS OF SUICIDE GENE THERAPY AGAINST HEPATOCELLULAR CARCINOMA VIA ACTIVATING TH1-POLARIZED IMMUNE RESPONSES
Tomoya Tsuchiyama1,2, Yasunari Nakamoto1, Yoshio Sakai1, Seiji Yano2, Naofumi Mukaida3, Shuichi Kaneko1
1Gastroenterology, Graduate School of Medical Science, Kanazawa University, Kanazawa, Japan. 2Medical Oncology, Cancer Research Institute, Kanazawa University, Kanazawa, Japan. 3Molecular Bioregulation, Cancer Research Institute, Kanazawa University, Kanazawa, Japan

#1241
DIFFERENTIAL FUNCTIONS OF CYCLIN E1 AND E2 FOR CELL CYCLE CONTROL AND ENDOREPLICATION DURING LIVER REGENERATION IN MICE
Yulia Nevzorova1, Darjus F. Tschaharganeh1, Peter Sicinski2, Christian Trautwein1, Christian Liedtke1
1Department of Medicine III, University Hospital Aachen, Aachen, Germany. 2Dana-Farber Cancer Institute, Boston, MA, USA

#1242
S-ADENOSYLMETHIONINE AND METHYLTHIOADENOSINE INHIBIT LIPOPOLYSACCHARIDE-INDUCED TUMOR NECROSIS FACTOR α EXPRESSION VIA MODULATION OF HISTONE METHYLATION
Ainhoa Iglesias Ara, Meng Xia, Komal Ramani, Shelly C. Lu Medicine, Keck School of Medicine USC, Los Angeles, CA, USA

#1243
ADENOVIRAL TRANSFER OF SIRNA AGAINST POLO-LIKE KINASE 1 INHIBITS TUMOR PROGRESSION OF HEPATOCELULAR CARCINOMA IN VITRO AND IN VIVO
Christina Baehr1, Jörg Haupenthal2, Otto Kollmar3, Bernd Kronenberg1, Simone Kiernymayer2, Thomas Pieli2, Oliver Waidmänn3, Stefan Zeuzem1, Albrecht Piiper2
1Department of Medicine I, J. W. Goethe-University Hospital, Frankfurt, Germany. 2Department of Medicine II, University Hospital of Saarland, Homburg/Saar, Germany. 3Department of General, Visceral, Vascular and Pediatric Surgery, University Hospital of Saarland, Homburg/Saar, Germany

#1244
GENE EXPRESSION BASED RECURRENT PREDICTION OF HBV-RELATED HUMAN HEPATOCELULAR CARCINOMA
Yoon Jun Kim1, Hyun Goo Woo2, Yong Jin Jung1, Dong Hee Kim1, Bum Joon Park1, Nam-Joon Yi2, Kyung-Suk Suh1, Kuhn Ulke2, Jung-Hwan Yoon1, Snorri S. Thorgeirsson4, Hyo-Suk Lee1
1Department of Internal Medicine, Seoul National University Hospital, Seoul, South Korea. 2Korea Bioinformation center, Korea Research Institute of Bioscience and Biotechnology, Daejeon, South Korea. 3Department of Surgery, Seoul National University Hospital, Seoul, South Korea. 4Laboratory of Experimental Carcinogenesis, Center for Cancer Research, National Cancer Institute, National Institutes of Health, Bethesda, MD, USA
#1245
MITOCHONDRIAL CHOLESTEROL IN HEPATOMA CELLS MODULATES APOPTOSIS SUSCEPTIBILITY AND CANCER THERAPY IN TUMOR XENOGRAFTS
Joan Montero, Albert Morales, Laura Ucuna, Josep M. Lluis, Carmen Garcia-Ruiz, Anna Colell, Jose C. Fernandez-Checa
Liver Unit, Instituto Malalties Digestives, Hospital Clinic, Barcelona, Spain

#1246
HEPATOCYTE GROWTH FACTOR ATTENUATED MOUSE LIVER FIBROSIS BY ADENO-ASSOCIATED VIRUS VECTOR
Kazuhiro Suzumura, Tadamichi Hirano, Yuji Iimuro, Jiro Fujimoto
Surgery, Hyogo college of medicine, Nishinomiya, Japan

#1247
SUBCUTANEOUS VACCINATION WITH DENDRITIC CELLS ENGINEEREED TO EXPRESS MAFP AND IL-12 INDUCES INHIBITION OF AFP-EXPRESSING SUBCUTANEOUS HEPATOCELLULAR TUMOR GROWTH IN MICE
Maria A. Gonzalez-Carmona1, Carlo Schneider1, Ingo G. Schmidt-Wolf1, Volker Schmitz1, Tilman Sauerbruch1, Wolfgang H. Caselmann2
1Internal Medicine I, University of Bonn, Bonn, Germany. 2Bavarian State Ministry of the Environment, Public Health and Consumer Protection, Munich, Germany

#1248
TRANSFORMING GROWTH FACTOR-β GENE EXPRESSION SIGNATURE PREDICTS CLINICAL OUTCOME IN CANCER
Cedric Coulouarn, Valentina M. Factor, Snorri S. Thorgerisson
Laboratory of Experimental Carcinogenesis, NIH/NCI, Bethesda, MD, USA

#1249
A UNIQUE METASTASIS-RELATED MICRORNA EXPRESSION SIGNATURE IS A PROGNOSTIC INDICATOR OF SURVIVAL AND RECURRENT IN HEPATOCELLULAR CARCINOMA
Anuradha Budhu1, Hu-Liang Jia1,2, Marshonna Forguers1, Chang-Gong Liu1, David Goldstein3, Amy Lam4, Krista Zanetti1, Qing-Hai Ye2, Lun-Xiu Qin2, Carlo Croce1, Zhao-You Tang2, Xin Wang1
1Laboratory of Human Carcinogenesis, National Cancer Institute, Bethesda, MD, USA. 2Liver Cancer Institute and Zhongshan Hospital, Fudan University, Shanghai, China. 3Department of Molecular Virology, Immunology and Medical Genetics and Comprehensive Cancer Center, Ohio State University, Columbus, OH, USA. 4Office of Science and Technology Partnerships, Center for Cancer Research, National Cancer Institute, Bethesda, MD, USA. 5EMMS Corporation, Rockville, MD, USA

#1250
HUGL-2, THE HUMAN HOMOLOGUE OF THE DROSOPHILA TUMOR SUPPRESSOR LGL, IS REGULATED BY EGF AND SNAIL, A PRIME REGULATOR OF EPITHELIAL-MESENCHYMAL TRANSITION (EMT)
Tim Zimmerman1, Anubha Kashyap1, Urs Hartmann1, Gerd Otto2, Peter R. Galle1, Susanne Strand1, Dennis Strand1
11st Department of Medicine, University of Mainz, Mainz, Germany. 2Department of Transplantation Surgery, University of Mainz, Mainz, Germany

#1251
ENHANCED RETINOIC ACID-INDUCED APOPTOSIS IN HYPOXIC HEPATOCELLULAR CARCINOMA CELLS VIA ER STRESS-RELATED JNK ACTIVATION IS ATTENUATED BY HYPOXIA INDUCTION OF CRABP-II
Jung-Hwan Yoon1, Jeong-Hoon Lee1, Goh Eun Chung1, Bo Hyun Kim1, Sun Jung Myung1, Jong In Yang1, Won Kim1, Yoon Jun Kim1, Kyung-Suk Suh2, Hyo-Suk Lee3
1Department of Internal Medicine and Liver Research Institute, Seoul National University College of Medicine, Seoul, South Korea. 2Department of Surgery, Seoul National University College of Medicine, Seoul, South Korea

#1252
INVESTIGATION OF THE ROLE OF GLYPCAN-3 IN RAT HEPATOCYTE GROWTH AND LIVER REGENERATION
Bowen Liu, William C. Bowen, Aaron W. Bell, Shirish Paranjpe, Wendy M. Mars, Kari N. Nejak-Bowen, Jianhua Luo, George Michalopoulos
Pathology, University of Pittsburgh Medical Center, Pittsburgh, PA, USA

#1253
THE ROLE OF NF-κB ACTIVITY IN THE ANTIVIRAL ACTION OF INTERFERON
Lawrence Pfeffer
UTHSC, Memphis, TN, USA

#1254
GANGLIOSIDE GD3 SYNTHASE OVEREXPRESSION SENSITIZES HUMAN HEPATOMA CELLS TO HYPOXIA BY SUPPRESSING THE NUCLEAR FACTOR-κB-DEPENDENT SURVIVAL PATHWAY
Josep M. Lluis1, Albert Morales1, Scott Welford2, Amato Giaccia2, Jose C. Fernandez-Checa1
1Liver Unit, Instituto Malalties Digestives, Hospital Clinic, IDIBAPS, CSIC, Barcelona, Spain. 2Division of Radiation and Cancer Biology, Stanford University, Stanford, CA, USA

#1255
TRANSLATIONAL CONTROL OF GENE EXPRESSION DURING LIVER DIFFERENTIATION
Desiree M. Espiet, Richard Stockert
Department of Medicine, Albert Einstein College of Medicine, Liver Research Center, Bronx, NY, USA
#1256
**IN VIVO SUPPRESSION OF MAFA MRNA WITH SIRNA AND ALTERATION OF THE GENE EXPRESSION PROFILE, ESPECIALLY OF ADIPOCYTOKINE GENES, IN MOUSE LIVER ANALYZED BY THE MICROARRAY METHOD**

Mariko Tsuchiya¹, Atsushi Maeda¹, Junko Tanaka¹, Ken Tsuchiya²  
¹Institute of Geriatrics, Tokyo Women’s Medical University, Tokyo, Japan. ²Department of Medicine IV, Tokyo Women’s Medical University, Tokyo, Japan

#1257
**AUGMENTER OF LIVER REGENERATION (ALR): THE FACTOR THAT REGULATES HEPATOCYTE APOPTOSIS IN LIVER REGENERATION AFTER PARTIAL HEPATECTOMY**

Lorenzo Polimeno, Barbara Pesetti, Emanuele Annoscia, Marcella Margiotta, Floriana Giorgio, Thomas Lisowsky, Annacinzia Amoruso, Antonio Francavilla  
DETO, Università degli Studi di Bari, Bari, Italy

#1258
**COBALT PROTOPORPHYRIN BINDS TO BACH1, A TRANSCRIPTIONAL REPRESSOR OF HEME OXYGENASE 1 GENE**

Weihong Hou¹, Ying Shan¹, Richard W. Lambrecht², Jianyu Zheng¹, Susan E. Donohue¹, Herbert L. Bonkovsky²  
¹Department of Medicine, University of Connecticut Health Center, Farmington, CT, USA. ²The Liver-Biliary-Pancreatic Center, University of Connecticut Health Center, Farmington, CT, USA.

#1259
**POSSIBLE ROLE OF TYROSINE KINASE INHIBITOR AND PROTEASOME INHIBITOR FOR HCC TREATMENT**

Tomomi Kogiso², Hikaru Nagahara¹, Keiko Shiratori²  
¹Sanno Hospital, International University for Health and Welfare, Tokyo, Japan. ²Institute of Gastroenterology, Tokyo Women’s Medical University, Tokyo, Japan

#1260
**GENE EXPRESSION PROFILE OF PERIPHERAL BLOOD MONONUCLEAR CELLS MAY REFLECT THOSE OF TUMOR-INFILTRATING LYMPHOCYTES IN HEPATOCELLULAR CARCINOMA**

Yoshio Sakai¹, Masao Honda¹, Haruo Fujinaga², Isamu Tatsumi², Shuichi Kaneko¹  
¹Gastroenterology, Kanazawa University Hospital, Kanazawa, Japan. ²Disease Control and Homeostasis, Kanazawa University, Kanazawa, Japan

#1261
**HUMAN GANKYRIN OVEREXPRESSION DOWNREGULATES P53 EXPRESSION AND PROMOTES CELL PROLIFERATION IN ZEBRAFISH**

Seung Kew Yoon, So Yeon Kim, Wonhee Hur, Jung-Eun Choi, Daniel Kim, Lian-Shu Piao, Chan Ran You, Hyun Young Woo, Soung Won Jeong, Si Hyun Bae, Jong Young Choi  
Department of Internal Medicine, The Catholic University of Korea, Seoul, South Korea

#1262
**IN VITRO VALIDATION THAT PHARMACOLOGIC INHIBITION OF FRIZZLED RECEPTORS CAN EXERT ANTI-ONCOGENIC PROPERTIES IN HUMAN CANCEROUS HEPATOCYTES**

Sarah Beseme¹, Lydie Lefrancois¹, Pierre Jalino², Christian Trepo¹, Ludmila Vitvitski¹, Philippe Merle¹  
¹u871, INSERM, Lyon, France. ²UMR 5161, CNRS-ENS, Lyon, France

#1263
**HYPOXIA INDUCED GENE EXPRESSION SIGNATURE IN NORMAL HEPATOCYTES AND HUMAN HEPATOCELLULAR CARCINOMA**

Salvador Naranjo-Suarez, Valentina M. Factor, Cedric Coulouarn, Snorri Thorgrimsson, NCI, NIH, Bethesda, MD, USA

#1264
**CHROMATIN-BASED ANALYSIS OF THE IFNα TRANSCRIPTOME REVEALS FUNCTIONALLY DISTINCT SUBSETS OF STAT2 DIRECT TARGET GENES**

Barbara Testoni¹,², Christine Voellenke², Giovanni Blandino², Massimo Levrero¹,²  
¹Dept. Internal Medicine, University of Rome La Sapienza, Rome, Italy. ²Rome Oncogenomic Center (ROC), Rome, Italy

#1265
**COMPREHENSIVE GENE EXPRESSION ANALYSIS IN HEPATOCELLULAR CARCINOMA (HCC) BY NEWLY DEVELOPED 5'-END SAGE METHOD AND IDENTIFICATION OF NOVEL UP-REGULATED INTRONIC TRANSCRIPT**

Yuji Hodo¹,², Shin-ichi Hashimoto², Shungo Deshimaru³, Masao Honda¹, Taro Yamashita¹, Teruyuki Ueda¹, Kouji Matsuhashi², Shuichi Kaneko¹  
¹Gastroenterology, Graduate school of Medicine Science, Kanazawa University, Kanazawa, Japan. ²Molecular Preventive Medicine, University of Tokyo, Tokyo, Japan. ³Post Genome Institute Co., Ltd., Tokyo, Japan

#1266
**HYDRODYNAMICS-BASED INJECTION OF A SHORT HAIRPIN RNA-PRODUCING VECTOR TARGETING C-JUN IN RAT LIVERS**

Kazuyuki Hanajiri¹, Hiroshi Mitsu³, Toshiyuki Maruyama¹, Naoaki Hashimoto³, Haruki Yamada³, Masao Omata¹  
¹Gastroenterology, The University of Tokyo, Tokyo, Japan. ²Gastroenterology, Tokyo Teishin Hospital, Tokyo, Japan. ³Gastroenterology, Social Insurance Central General Hospital, Tokyo, Japan
#1267
CLINICOPATHOLOGICAL SIGNIFICANCE OF EZH2 AND BMI1 EXPRESSION IN PATIENTS WITH HEPATOCELLULAR CARCINOMA

Yutaka Yonemitsu1, Fumio Imazeki1, Nagai Yuichiro2, Kenichi Fukai3, Makoto Arai3, kaiyu zhang4, Keiichi Fujiwara5, Osamu Yakesuka1
1Department of Medicine and Clinical Oncology, Graduate School of Medicine, Chiba University, Chiba, Japan. 2Department of Basic Pathology, Graduate School of Medicine, Chiba University, Chiba, Japan

#1268
RNA INTERFERENCE MEDIATED SILENCING OF EGFR IN REGENERATING RAT LIVER FOLLOWING A PARTIAL HEPATECTOMY

Shirish Paranjpe, William Bowen, George Michalopoulos
Pathology, University of Pittsburgh, Pittsburgh, PA, USA

#1269
RNAI THERAPEUTICS FOR THE TREATMENT OF LIVER DISEASES

Akin Akin1, Daniel Anderson2, Birgit Bramlage2, David Bumcrot3, J. Robert Dorkin1, Kevin Fritzgerald1, Maria Frank-Kamenetsky1, Michael Goldberg3, Jens Harborth1, Jay D. Horton5, K. Narayananannair Jayaprakash1, Muthusamy Jayaraman1, Matthias John1, Kallanbhathil Rajeev1, Victor Kotelianiski1, Robert Langer3, Muthiah Manoharan1, Lubomir Nechev1, June Qin1, Timothy Racie1, Ingo Röh2, Dina Sahl2, Jürgen Soutscheck2, Hans-Peter Vornlocher1, Tracy Zimmermann1, Andreas Zumbuehl5
1Dept of Surgical and Gastroenterological Sciences, University of Padua, PADOVA, Italy. 2Internal Medicine, University of Padua, PADOVA, Italy. 3Laboratory Medicine, Hospital Bambin Gesù, Roma, Italy. 4Laboratory of Histopathology, Istituto Zooprofilattico Sperimentale delle Venezie, PADOVA, Italy

#1270
INHIBITION OF TNF ALPHA STIMULATION BY PRETREATING HUMAN HEPATOCYTES WITH STAUROSPORINE AND LY294002 ON INTRINSIC APOPTOSIS PATHWAYS

Andromachi Kotsafti1, Anna Granato4, Maria Teresa Vilei2, Chiara Carlotta1, Maurizio Muraca2, Marina Bertolami1
1Dept of Surgical and Gastroenterological Sciences, University of Padua, PADOVA, Italy. 2Internal Medicine, University of Padua, PADOVA, Italy. 3Laboratory Medicine, Hospital Bambin Gesù, Roma, Italy. 4Laboratory of Histopathology, Istituto Zooprofilattico Sperimentale delle Venezie, PADOVA, Italy

#1271
MODULATION OF STEMNESS IN DYSFUNCTIONAL PROGENITOR/STEM CELLS ALTERS CANCER FORMATION IN THE LIVER

Chohee Yun1, Michael J. Pishvaian1, Yi Tang1, Krit Kitisin1, Eugene A. Volpe1, Jonathan S. Mendelson1, Wilma Jogunnoori1, Cuiling Li5, Chu-Xia Deng3, Susette Mueller4, Habtom Ressom1, Asif Rasheid6, Anton N. Sidawy2, Stephen R. Evans1, Kirti Shetty1, Michael Zasloff1, Lynt B. Johnson1, Lopa Mishra1,5

**MODELING THE POTENTIAL COST-EFFECTIVENESS OF ADDING A NOVEL STAT-C AGENT TO CURRENT STANDARD THERAPY IN PATIENTS WITH GENOTYPE 1 CHRONIC HEPATITIS C INFECTION**

Sumedha P. Galhenage, Gillian D. Sanders, Keyur Patel, Kevin A. Schulman, John G. McHutchison

1GI/Hepatology, Duke Clinical Research Institute, Durham, NC, USA. 2Outcomes Research and Assessment Group, Duke Clinical Research Institute, Durham, NC, USA. 3Division of Clinical Pharmacology, Duke University Medical Center, Durham, NC, USA. 4Division of Gastroenterology and Hepatology, Duke University Medical Center, Durham, NC, USA. 5Center for Clinical and Genetic Economics, Duke Clinical Research Institute, Durham, NC, USA. 6Division of General Internal Medicine, Duke University Medical Center, Durham, NC, USA

#1397
**AM3 INHIBITS HCV REPLICATION THROUGH ACTIVATION OF PERIPHERAL BLOOD MONONUCLEAR CELLS**

Pedro L. Majano, Samuel Martín-Vilchez, Yolanda Rodriguez-Munoz, Paloma Sanz Cameno, Francisca Molina-Jimenez, Jose L. Alonso, Salvador Gonzalez, Manuel Lopez-Cabrera, Ricardo Moreno-Otero

1Liver Unit, Hospital Universitario “La Princesa”, Madrid, Spain. 2Molecular Biology Unit, Hospital Universitario “La Princesa”, Madrid, Spain. 3Memorial Sloan-Kettering Cancer Center, New York, NY, USA. 4R&D Department, Industrial Farmaceútica Cantabria S.A, Madrid, Spain

#1398
**PRECLINICAL PHARMACOKINETIC CHARACTERIZATION OF GS-9190, A NOVEL NON-NUCLEOSIDE HCV NS5B POLYMERASE INHIBITOR**

Chris Yang, Yujin Wang, Lani Wieman, Eugene Eisenberg, Melody Lee, Bernard Murray, Leah Tong, Adrian Ray, Steven Bondy, Winston Tse, Amy Coluci, Matthew Wright, Laura S. Lehman, William A. Lee, Gerald Rhodes

Gilead Sciences, Foster City, CA, USA
Liver Fibrogenesis and Non-Parenchymal Cell Biology

#1399
SONIC HEDGEHOG IS AN AUTOCRINE VIABILITY FACTOR FOR MYOFIBROBLASTIC HEPATIC STELLATE CELLS
Liu Yang1, Ying Wang1, Hua Mao1, Susanne Fleig1, Alessia Omenetti1, Kevin Brown1, Jason K. Sicklick2, Yin-Xiong Li1, Anna Mae Diehl1
1Medicine, Division of Gastroenterology, Duke University Medical Center, Durham, NC, USA. 2Surgery, Johns Hopkins University School of Medicine, Baltimore, MD, USA

#1400
AUTOCRINE SIGNALING BY SDF-1α THROUGH ITS RECEPTOR, CXCR4, MEDIATES HEPATIC STELLATE CELL ACTIVATION IN VIVO AND IN VITRO
Feng Hong, Ana Tuyama, Ritu Agarwal, Ritu Gupta, Xin Cheng, Anita Garg, Yukiko Inoue, M. Isabel Fiel, Myron Schwartz, Martina Schwarzkopf, Alison D. Schecter, Meena B. Bansal
Mount Sinai School of Medicine, New York, NY, USA

#1401
HUMAN AND RAT HEPATIC STELLATE CELLS EXPRESS OPIOID RECEPTORS AND ARE STIMULATED BY ENDOGENOUS OPIOID PEPTIDES IN A PARACRINE MANNER
Gianluca Svegliati-Baroni1, Cinzia Candelaresi1, Tania Roskams2, Samuele De Minicis1, Stefania Saccomanno1, Nicola Cautero3, Salzano Renata4, Fabrizio Di Francesco5, Marco Marzioni1, Alessandro Casini4, Andrea Risaliti3, Antonio Benedetti1
1Gastroenterology, PolITEchnic University of Marche, Ancona, Italy. 2Morphology and Molecular Pathology, University of Leuven, Leuven, Belgium. 3Hepatobiliary and Liver transplant surgery, Politechnic University of Marche, Ancona, Italy. 4Nutrition Center and GI Unit, University of Florence, Florence, Italy

#1402
EFFECT OF SIMULATED MICROGRAVITY ON RAT HEPATIC STELLATE CELLS AND THEIR INTERACTION WITH EXTRACELLULAR MATRIX PROTEINS
Kota N. Gopalakrishna, Bruce Luxon
GI Division, University of Iowa, Iowa City, IA, USA

#1403
MOUSE HEPATIC STELLATE CELL INSULIN RESISTANCE IS CAUSED BY DOWNREGULATION OF INSULIN RECEPTOR PROTEIN AND DEFECTIVE DOWNSTREAM SIGNALING
Sara Knops1, Leo A. van Grunsven1, Hendrik Reynaert1,2, Albert Geerts1
1Department of Cell biology, Vrije Universiteit Brussel, Brussels, Belgium. 2Department of Gastroenterology-Hepatology, Vrije Universiteit Brussel, Brussels, Belgium

#1404
A NOVEL ISOLATION METHOD FOR PRIMARY RAT PORTAL FIBROBLASTS BY EXPLANTING BILIARY TRACT TISSUE REVEALS KEY BIOLOGICAL DIFFERENCES COMPARED TO LOBULAR ACTIVATED HEPATIC STELLATE CELLS AS ASSESSED BY CYTOKINE MICROARRAY
Xiaokun Ding, Neeraj Saxena, Frank A. Anania
Department of Medicine, Division of Digestive Diseases, Emory University School of Medicine, Atlanta, GA, USA

#1405
NOX2 AND RAC1 PLAY IMPORTANT ROLES IN LIVER FIBROGENESIS BY FACILITATING PHAGOCYTOSIS OF APOPTOTIC BODIES AND PRODUCTION OF ROS BY STELLATE CELLS
Joy Jiang, Kornelia Baghy, Natalie Torok
Gastroenterology and Hepatology, UCDMC, Sacramento, CA, USA

#1406
REGULATION OF HEPATIC STELLATE CELL GROWTH BY NUCLEAR AND CYTOSOLIC CALCIUM SIGNALS
Elwy M. Soliman, Michelle Rodrigues, Davidson A. Gomes, Jin Yu, Michael H. Nathanson, Jonathan A. Dranoff
Internal Medicine/Digestive Diseases, Yale University School of Medicine, New Haven, CT, USA

#1407
APOPTOTIC HEPATOCYTE DNA INHIBITS HSC CHEMOTAXIS AND STIMULATES HEPATIC STELLATE CELL DIFFERENTIATION VIA TLR9
Azuma Watanabe1, Aradeshir Hashmi1, Davidson Gomes1, Terrence Town2, Abdallah Badou2, Muhammad A. Sorial1, Richard A. Flavell2, Wajahat Z. Mehal1
1digestive disease, Yale University, New Haven, CT, USA. 2Immunobiology, Yale University, New Haven, CT, USA

#1408
SYMPATHETIC NERVOUS SYSTEM SIGNALLING IN HUMAN PRIMARY HEPATIC STELLATE CELLS: A NOVEL ANTI-FIBROTIC PATHWAY
Barbara Sigala1, Florence Potter1, Clare Selden1, Myrddin Rees2, Anthony Wierzbicki3, Humphrey J. Hodgson1, Jude A. Oben1,3
1Centre for Hepatology, University College London, London, United Kingdom. 2Surgery, North Hampshire Hospital, Basingstoke, United Kingdom. 3Gastroenterology, Guy’s and St Thomas’ Hospital, London, United Kingdom

#1409
ENDOGLIN PHOSPHORYLATION BY TGF-β RECEPTORS IN TRANSDIFFERENTIATING HSC
Steffen K. Meurer, Wanda N. Vreden, Lidia Tihaa, Axel M. Gressner, Ralf Weiskirchen
Inst. of Clinical Chemistry and Pathobiocchemistry - Central Laboratory, RWTH University Hospital, Aachen, Germany
#1410
OXIDATIVE STRESS INDUCE COLLAGEN SYNTHESIS BY C-ABL ACTIVATION IN HUMAN HEPATIC STELLATE CELLS
Tommaso Mello1, Elisabetta Ceni1, Simone Polvani2, Laura Cioni1, Francesca Lisi1, Barbara Ottanelli1, Francesca Buccoliero1, Mirko Tarocchi1, Stefano Milani1, Andrea Galli1
1Clinical Pathophysiology - Gastroenterology Unit, University of Florence, Florence, Italy. 2FiorGen Pharmacogenomic Foundation, Florence, Italy

#1411
MESENCHYMAL β-CATENIN SIGNALING REGULATES HEPATIC STELLATE CELLS FATE
Tove A. Berg, Stijn De Langhe, Joaquin J. Estrada, Hidekazu Tsukamoto, Saverio Bellusci, Kasper Wang
Saban Research Institute, Los Angeles, CA, USA

#1412
MOUSE HEPATIC STELLATE CELLS EXPRESS THE INTERMEDIATE FILAMENT PROTEIN SYNCOILIN
Elke Van Rossen1, Zhenan Liu1, Leo A. van Grunsven1, Jona Van der Straeten1, Jan Van Daele2, Hendrik Reynaert1-3, Jean-Pierre Timmermans2, Albert Geerts1
1Department of Cell Biology, Vrije Universiteit Brussel, Jette, Belgium. 2Laboratory of Cell Biology & Histology, Department of Veterinary Sciences, Universiteit Antwerpen, Antwerpen, Belgium. 3Department of Gastroenterology-Hepatology, University Hospital, Vrije Universiteit Brussel, Jette, Belgium

#1413
ATRIAL NATRIURETIC PEPTIDE (ANP) PREVENTED LIVER FIBROSIS IN RAT USING NEW TREATMENT SYSTEM
Noriko Ishigaki, Naoki Yamamoto, Haiyan Jin, Koichi Uchida, Shuji Terai, Isao Sakaida
Department of Gastroenterology & Hepatology, Yamaguchi University,Graduated School of Medicine, Yamaguchi University, Ube city, Japan

#1414
THE SYNTHETIC COLLAGEN ANALOG (GPO)10 STIMULATES PROLIFERATION, MIGRATION AND EXPRESSION OF N-CADHERIN IN HEPATIC STELLATE CELLS VIA ACTIVATION OF PROMMP-2
Christian Freise1, Martin Ruehl1, Marion Seja1, Ulrike Erben1, Richard Farndale2, Detlef Schuppan3, Martin Zeitz1, Rajan Somasundaram1
1Gastroenterology/Hepatology, Charité-Campus B.Franklin, Berlin, Germany. 2Department of Pharmacology, University of Cambridge, Cambridge, United Kingdom. 3Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, MA, USA

#1415
CD95 LIGAND INDUCES PROLIFERATION AND CD95-TYROSINE NITRATION IN QUIESCENT RAT HEPATIC STELLATE CELLS
Roland Reinehr, Annika Sommerfeld, Stephan Becker, Dieter Haussinger
Gastroenterology, Hepatology and Infectiology, University Hospital Duesseldorf, Duesseldorf, Germany

#1416
INHIBITION AND IDENTIFICATION OF NONMUSCLE MYOSIN II ISOFORMS IN HEPATIC STELLATE CELLS
Cathy C. Moore, Christopher M. Yengo, Laura W. Schrum
Biology, UNC-Charlotte, Charlotte, NC, USA

#1417
DIFFERENT REGULATION OF THE CONNECTIVE TISSUE GROWTH FACTOR IN HEPATIC STELLATE CELLS AND HEPATOCYTES
Lucia Wickert, Nicolas Chatain, Karin Kruischinsky, Axel M. Gressner
Inst. of Clinical Chemistry and Pathobiochemistry - Central Laboratory, RWTH University Hospital, Aachen, Germany

#1418
RELAXIN INCREASES THE EXPRESSION AND ACTIVITY OF PPARG IN ACTIVATED HEPATIC STELLATE CELLS
Robert Bennett1,2, Dean J. Tuma1,2
1Medical Research, VA Medical Center, Omaha, NE, USA. 2Internal Medicine, University of Nebraska Medical Center, Omaha, NE, USA

#1419
HSC EXPRESS NALP3 AND ASC, AND UNDERGO DIFFERENTIATION IN RESPONSE TO URIC ACID CRYSTALS
Azuma Watanabe1, Ardeshir Hashmi1, Muhammad N. Jhandier1, Zeeshan Khan1, Fayyaz Sutterwala2, Mohammad A. Sohail1, Shamail Mahmood1, Richard A. Flavell2, Wajahat Z. Mehal1
1digestive disease, Yale University, New Haven, CT, USA. 2Immunobiology, Yale University, New Haven, CT, USA

#1420
L-THYROXINE (T4) INDUCES PROLIFERATION OF HEPATIC STELLATE CELLS VIA CELL SURFACE INTEGRIN αVβ3 AND ENHANCES EXPRESSION OF α-SMOOTH MUSCLE ACTIN AND COLLAGEN I TRANSCRIPTION
Isabel Zvibel1, Ella Barlev1, Adam Phillips2, Dikla Atias1, Shirley Abramovitch1, Zamir Halpern1, Ran Oren1
1Gastroenterology, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel. 2Internal medicine A, Assaf Haroeh Hospital, Tzerifin, Israel

#1421
GLUTATHIONE, BUT NOT CATALASE, IS IMPORTANT IN THE PROTECTION OF HEPATIC STELLATE CELLS AGAINST OXIDATIVE STRESS
Sandra Dunning, Rebekka Hannivoort, Laura Conde de la Rosa, Manon Buist-Homan, Klaas Nico Faber, Han Moshage
Division of Gastroenterology and Hepatology, University Medical Centre Groningen, Groningen, Netherlands
THE ADENINE RECEPTOR IS PRESENT IN RAT HEPATIC STELLATE CELLS (HSC), INDUCES HSC DIFFERENTIATION AND INHIBITS HSC CHEMOTAXIS

Azuma Watanabe, Ardeshir Hashmi, Muhammad N. Jhandier, Samir Gautam, Muhammad A. Sohail, Shamail Mahmood, Zeeshan Khan, Wajahat Z. Mehal
digestive disease, Yale University, New Haven, CT, USA

TARGETED BINDING OF FLUORESCENCE-LABELED CYCLIC RGD PEPTIDES TO ACTIVATED HEPATIC STELLATE CELLS VIA INTEGRIN AVB3 RECEPTOR

Jiyao Wang, Zheng Gi Song
Gastroenterology & Hepatology, ZhongShan Hospital, Fudan University, Shanghai, China

OSTEOPONTIN, AN OXIDANT STRESS-SENSOR IN HEPATOCYTES AND KUPFFER CELLS, TRIGGERS A FIBROGENIC RESPONSE IN STELLATE CELLS

Raquel Urtasun, Natalia Nieto
Medicine/Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA

UPREGULATION OF SMOOTH MUSCLE MARKER GENES IN ACTIVATED HEPATIC STELLATE CELLS IS MEDIATED BY TRANSFORMING GROWTH FACTOR-β INDUCED EXPRESSION OF SERUM RESPONSE FACTOR

Jens Herrmann, Ute Haas, Axel M. Gressner, Ralf Weiskirchen
Inst. of Clinical Chemistry and Pathobiocchemistry - Central Laboratory, RWTH University Hospital, Aachen, Germany

HBV INFECT HEPATIC STELLATE CELLS AND AFFECT THEIR PROLIFERATION AND EXPRESSION OF EXTRACELLULAR MATRIX

Yan Cui, Yu Wang, Jidong Jia
liver research center, beijing friendship hospital, Capital Medical University, Beijing, China

REACTIVE NITROGEN SPECIES MODULATE EARLY EXTRACELLULAR MATRIX REMODELING VIA INDUCTION OF MATRIX METALLOPROTEINASE-1 AND TUMOR NECROSIS FACTOR α

Natalia Nieto, Francisco J. Cubero, Maria Vera, Raquel Urtasun
Medicine/Liver Diseases, Mount Sinai School of Medicine, New York, NY, USA

THY-1 DISTINGUISHES BETWEEN HEPATIC STELLATE CELLS AND LIVER MYOFIBROBLASTS IN VITRO AND IN VIVO

Jozsef Dudas, Tuemen Mansuroglu, Danko Batusic, Federico Moriconi, Bernhard Saile, Giuliano Ramadori
Gastroenterology and Endocrinology, Georg-August-University, Goettingen, Germany

T3 ENHANCES EXPRESSION OF α-SMOOTH MUSCLE ACTIN AND OF CYTOKINES TNFα AND SDF1α IN PRIMARY STELLATE CELLS, YET INHIBITS COLLAGEN I TRANSCRIPTION

Isabel Zvibel1, Dikla Atlas1, Adam Phillips2, Shirley Abramovitch1, Zaki Kraiem1, Zamir Halpern1, Ran Oren1
1Gastroenterology, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel. 2Internal medicine A, Assaf Harofeh Hospital, Zerifin, Israel

PRIMARY MOUSE HEPATIC STELLATE CELLS ARE LEPTIN AND ADIPONECTIN RESISTANT

Ben Schroyen, Inge Mannerts, Leo A. van Grunsven, Albert Geerts
Cell Biology (CYTO), Vrije Universiteit Brussel (VUB), Brussels, Belgium

NOTCH SIGNALING IN NODULAR REGENERATIVE HYPERPLASIA AND HEPATIC MICROCIRCULATION

Mona Y. Ali1, Michael Dill1, Luigi Terracciano2, Markus H. Heim1, David Semela1
1Division of Gastroenterology and Hepatology, University Hospital Basel, Basel, Switzerland. 2Institute of Pathology, University Hospital Basel, Basel, Switzerland

EFFECT OF ACUTE AND CHRONIC LIVER INJURY ON HEPATOTROPIC TARGETING PROPERTIES OF ERYTHROCYTE GHOSTS

Olav A. Gressner, Martin Koch, Birgit Lahme
Institute of Clinical Chemistry and Pathobiocchemistry, University Hospital of the RWTH Aachen, Aachen, Germany

ACTIVATION OF KUPFFER CELLS IS INVOLVED IN ALCOHOL-INDUCED DOWN-REGULATION OF HEPcidIN EXPRESSION IN THE LIVER

Duygu Dee Harrison-Findik, Elizabeth Klein, John Evans, John L. Gollan
Internal Medicine, University of Nebraska Medical Center, Omaha, NE, USA

DIFFERENTIAL MODULATION OF PRO- AND ANTI-REGENERATIVE CYTOKINES BY TLR STIMULATION IN NON-PARENCHYMAL LIVER CELLS

Agnes Szczeponek, Jan-Peter Sowa, Joerg F. Schlaak
Dept. of Gastroenterology and Hepatology, University Hospital of Essen, Essen, Germany

CAUSAL KUPFFER CELL ACTIVATION BY FREE FATTY ACIDS SUPPRESSED THROUGH PEROxisome PROLIFERATOR-ACTIVATED RECEPTORS (PPAR) δ

Noriyuki Obara, Kaji Fukushima, Yoshiyuki Ueno, Yu Nakagome, Tooru Shimosegawa
Division of Gastroenterology, Tohoku University Graduate School of Medicine, Sendai, Japan
**Metabolic and Genetic Liver Disease**

### #1436

**VARIANT ERYTHROPOIETIC PROTOPORPHYRIA (EPP): A DISORDER WITH SEVERE EPP PHENOTYPE, NO MUTATIONS IN FERROCHELATASE DNA, AND ABNORMAL MITOFERRIN EXPRESSION.**

Joseph R. Bloomer, Yongmeng Wang, George Shaw, Nathaniel B. Langer, Barry Paw
1Liver Center, University of Alabama at Birmingham, Birmingham, AL, USA. 2Hematology, Brigham and Women’s Hospital, Harvard Medical School, Boston, MA, USA

### #1437

**DONOR HEPATOCYTES HAVE A SELECTIVE REPOPULATION ADVANTAGE OVER HOST HEPATOCYTES IN ALPHA 1-ANTI-TRYPSIN DEFICIENCY**

Govardhana Yannam, Hesham Basma, Tunda Hidvegi, Kimiaki Tanaka, Shintaro Sató, Ron Wong, David H. Perlmutter, Ira J. Fox
1Department of Surgery, University of Nebraska Medical Center, Omaha, NE, USA. 2University of Pittsburgh School of Medicine, Pittsburgh, PA, USA. 3Stanford University School of Medicine, Palo Alto, CA, USA

### #1438

**FUNCTIONAL LOSS OF TRANSFERRIN RECEPTOR 2 DECREASES BASAL HEPcidIN EXPRESSION, BUT DOES NOT ABOLISH REGULATION BY IRON OR ERYTHROPOIETIN**

1Division of GI and Hepatology, St. Louis University School of Medicine, St Louis, MO, USA. 2Pediatrics, St. Louis University School of Medicine, St Louis, MO, USA. 3Biochemistry and Molecular Biology, Saint Louis University School of Medicine, St Louis, MO, USA

### #1439

**HEPATOSPLENOMEGALY AND BLOOD PARAMETERS IN GAUCHER DISEASE - ANALYSIS OF DOSE-RESPONSE RELATIONSHIPS IN ENZYME REPLACEMENT THERAPY**

Stephan vom Dahl, Carla Hollak, Ari Zimran, Joel Charrow, Katherine Kacena, Pram Mistry, Greg Grabowski
1Dept. of Internal Medicine, Gastroenterology and Hepatology, St. Franziskus-Hospital, Academic Teaching Hospital, University of Cologne, Cologne, Germany. 2Cincinnati Childrens Hospital, Cincinnati, OH, USA. 3Childrens Memorial Hospital, Chicago, IL, USA. 4Amsterdam Medical Center AMC, Amsterdam, Netherlands. Genzyme Corporation, Boston, MA, USA. 6Yale School of Medicine, New Haven, CT, USA. 7Shaare Zedek Medical Center, Jerusalem, Israel

1 DELAYED AND REDUCED DOSE TACROLIMUS WITH MYCOPHENOLATE MOFETIL AND DACLIZUMAB REDUCES RENAL IMPAIRMENT AFTER LIVER TRANSPLANTATION: RESULTS OF A 1 YEAR PROSPECTIVE, RANDOMISED INTERNATIONAL TRIAL

James M. Neuberger, A. David Mayer; Liver Unit, Queen Elizabeth Hospital, Birmingham, United Kingdom

Introduction: Late onset renal impairment after liver transplantation is a major cause of end-stage renal disease and a risk factor for death. One of the risk factors for late-onset renal impairment is the dose and level of the calcineurin inhibitor during the early months after transplantation. Renal function at one year predicts longer-term renal function. Aim: we did a prospective randomised study to determine whether lower levels with or without delayed introduction of tacrolimus was associated with less renal impairment (as assessed by the Cockcroft-Gault formula) and no adverse effect on patient or graft. Methods: 525 adult recipients of a first graft were randomised to one of three groups in 30 European centers: group A: tacrolimus at the recommended dose (to achieve target levels ≥10ng/mL for the first month); group B: tacrolimus at a lower dose (trough target levels <8ng/mL for the first month and mycophenolate mofetil 2g/day) and group C: daclizumab on day 1 and 7, mycophenolate mofetil 2g/day and tacrolimus introduced on day 5 with trough target levels <8ng/mL. Corticosteroids were given according to local practice in each group. Results: Calculated GFR was 103, 107 and 98 mL/min in groups A, B and C at the start of the study and fell by 25, 24 and 17 mL/min at one year; the difference between A and C was statistically significant (p=0.003). Withdrawals because of adverse events occurred in 29, 18 and 21% and, as a sub-category, withdrawal related to renal impairment occurred in 12, 2 and 1% of the patients. At one year, patient death occurred in 9.2, 10 and 5% respectively and graft loss was 6.0, 5.9 and 6.6% respectively; dialysis was required in 17, 10 and 9% respectively during the first year: there was no difference in the incidence of biopsy-proven acute rejection (31, 30 and 25%). Diarrhoea occurred in 21, 31 and 25%. Conclusions: this study suggests that lower and delayed introduction of tacrolimus together with mycophenolate mofetil and daclizumab is associated with better preservation of renal function at one year without any significant adverse impact on patient or graft.

2 MYCOPHENOLATE MOFETIL (MMF) IN COMBINATION WITH LOW-DOSES OF CALCINEURIN INHIBITORS (CNI) FOR CHRONIC RENAL DYSFUNCTION AFTER LIVER TRANSPLANTATION (LT): 2-YEAR RESULTS OF A PROSPECTIVE, MULTICENTER, RANDOMIZED STUDY

Georges-Philippe Pageaux1, Lionel Rostaing2, Yvon Calmus3, Christophe Duvoux4, Claire Vanlemmens5, Jean Hardgwissen6, Paul-Henri Bernard7, Francis Navarro8, Dominique Larrey9

The following people have nothing to disclose: Lionel Rostaing, Yvon Calmus, Christophe Duvoux, Claire Vanlemmens, Jean Hardgwissen, Paul-Henri Bernard, Francis Navarro, Dominique Larrey

Chronic renal dysfunction has a major impact on long-term morbidity and mortality after LT. CNI nephrotoxicity represents the main cause. Aim: To introduce MMF in liver transplant recipients with chronic renal dysfunction to decrease CNI dosages without increasing rejection risk. Methods: 2-year prospective, multicenter, randomized study including liver transplant recipients with minimum interval of one year from LT. Chronic CNI-related renal dysfunction was defined as follows: increase in serum creatinin ≥140 µmol/l, proteinuria <1g/24h, absence of hematuria, absence of renal arteries stenosis or urinar tract disease. In all patients, a liver biopsy was performed during the 6 previous months before inclusion and at the end of the study. Patients were randomized in two groups. Group I combination of MMF (2 to 3 g/day) and reduced dose of CNI ≥50% of initial dose; group II: no MMF and reduced dose <25% of initial dose. Results: 56 patients were included in the study and we present the results of 46 patients, 24 in group I et 22 in group II. The two groups were comparable in terms of age, sex, etiology, indication for LT, interval from LT to inclusion, initial dose of CNI, initial serum creatinine and creatinine clairance. In group I, the mean daily doses of cyclosporine and tacrolimus were 163.2 mg and 4.4 mg at day 0, and 62.2 mg and 1.85 mg at month 24, respectively. In group II, there were 145.4 mg and 2.75 mg at day 0, and 102 mg and 1.5 mg at month 24, respectively. In group I, the mean serum creatinine and creatinine clairance were 171.7 µmol/l and 42.6 ml/mn at day 0, 142.8 µmol/l and 51.7 ml/mn at month 12, and 139.6 µmol/l and 48.3 ml/mn at month 24, respectively. In group II, they were 175.4 mg and 42.8 mg at day 0, 170.5 µmol/l and 44.8 ml/mn at month 12, and 166 µmol/l and 37.2 ml/mn at month 24, respectively (p=0.004 for Δ creatinine and 0.006 for Δ clairance between D0 and M12 and M12 and M24 ; no significant difference between M12 and M24). None biological rejection episode was observed in group I. There was no significant difference between the two groups in terms of secondary effects. Graft biopsy was performed in 7 patients of group 1: there were rejection-compatible lesions in 1 patient. Conclusion: In this 2-year prospective, randomized study, the reduction of at least 50 % of CNI dose combined to MMF, allowed to significantly improve the renal function of liver transplant recipients, without any biological rejection episode and without significant secondary effects. However, improvement was achieved at month 12, and there was no supplementary improvement between month 12 and month24.

3 HOSPITALIZATION RATES BEFORE AND AFTER ADULT-TO-ADULT LIVING DONOR OR DECASED DONOR LIVER TRANSPLANTATION

Robert M. Merion1, Tempie H. Shearon2, Carl L. Berg3, James E. Everhart4, Michael M. Abecassis5, Abraham Shaked6, Robert A. Fisher7, James F. Trotter8, Robert S. Brown9, Norah Terrault10, Paul H. Hayashi11, R M. Ghobrial12, A2ALL Study Group; 1Surgery, University of Michigan, Ann Arbor, MI; 2Biostatistics, University of Michigan, Ann Arbor, MI; 3Medicine, University of Virginia, Charlottesville, VA; 4NIH/NIDDK, Bethesda, MD; 5Surgery, Northwestern University, Chicago, IL; 6Surgery, University of Pennsylvania, Philadelphia, PA; 7Surgery, Medical College of Virginia/Virginia Commonwealth University, Richmond, VA; 8Medicine, University of Colorado, Denver, CO; 9Medicine, Columbia University, New York, NY; 10Medicine, University of California - San Francisco, San Francisco, CA; 11Medicine, University of North Carolina, Chapel Hill, NC; 12Surgery, University of California - Los Angeles, Los Angeles, CA

Background: Adult-to-adult living donor liver transplant (LDLT) recipients are reported to have higher complication rates than deceased donor (DDLT) recipients. This study examined resource utilization using hospitalization rates before and after transplant for LDLT and DDLT recipients. Methods: Data from the 9-center Adult-to-Adult Living Donor Liver Transplantation (A2ALL) retrospective cohort study were analyzed to determine pre-transplant (PRE), transplant (TXP), and post-transplant (POST) hospitalizations among LDLT candidates (potential living donor was evaluated) who received LDLT or DDLT. Hospital days and admission rates for LDLT and DDLT patients were calculated per patient-year at risk, starting from the date of initial potential donor history and physical examination. Rates were compared using Poisson regression. Results: Among 806 candidates, 384 received LDLT and 216 received DDLT. In addition to the transplants, there were 1678 recipient hospitalizations (252 PRE; 1426 POST). Mean PRE, TXP, and POST length of stay (LOS) was 5.7±6.2, 28.6±36.6, and 9.1±14.3 days for LDLT recipients and 4.1±3.7, 23.4±31.9, and 8.9±27.9 days for DDLT recipients, respectively. Compared to DDLT, LDLT recipients had significantly lower PRE hospital day and admission rates, but significantly higher POST rates (Table). Higher LDLT admission rates were observed for non-biliary reasons during the first post-transplant year and for biliary tract morbidity throughout follow-up. Patients were discharged to destinations other than home in 9.7% and 6.0% of POST hospitalizations for DDLT and LDLT, respectively (P=0.02). Conclusions: After transplantation, recipients of LDLT have significantly and persistently higher hospitalization rates than DDLT recipients. Higher hospitalization rates after LDLT in the first year were due to biliary and non-biliary reasons. During later follow-up, persistently higher rates of LDLT biliary tract morbidity requiring hospitalization were observed. LDLT candidates should be informed about the likelihood of higher hospitalization rates.

4 FACTORS INFLUENCING LIVER TRANSPLANT LENGTH OF STAY AND RESOURCE UTILIZATION AT TWO LARGE VOLUME TRANSPLANT CENTERS

Sandy Feng1, John P. Roberts1, Glenn A. Halff2, Kenneth Washburn3; 1Surgery, UCSF, San Francisco, CA; 2Transplant Center, Univ of Texas HSC, San Antonio, TX

Background: Length of stay (LOS) following liver transplantation (OLT) has been shown to be a reliable surrogate for costs associated with OLT. Little information exists regarding the influence of donor and recipient variables on LOS. Methods: Extensive data for adult non-status 1 OLTs from 1998-2005 were collected from two institutions (A, n=745; B, n=710) geographically removed from one another. The Donor Risk Index (DRI) and laboratory MELD scores were calculated to represent donor quality and recipient disease severity, respectively. Cox models were constructed to evaluate variables most likely to influence LOS for each institution's cohort and the combined cohorts. Results: The two OLT cohorts significantly differed in recipient diagnosis, race, gender, BMI (A:26.9; B:28.7;p<.0001), need for pre-tx HD (A:12.5%; B:8.5%; p<.0001), and donor race, gender (female; A:33.4%; B:40.1%; p=.0079), age (A:40.8 yrs; B:39.3 yrs; p=.03), % local donors (A:78.9%; B:82.1%; p=.0007), CIT (A:9.5 hrs; B:6.2 hrs; p<.0001) and DRI (A:1.46; B:1.40; p=.0013). LOS was comparable (A: 13.7 days; B:13.3 days; p=.052) although MELD was higher at A (A:22.4; B:20.4; p=.046). Cox models showed that increased R age, R MELD and non-local donor were associated with longer LOS for Institution A. For Institution B, increased R MELD and donor age, longer CIT, Re-Tx, R female, and decreased R INR and D weight were associated with a longer LOS (Table). For the combined cohort, non-local donor, R female gender, Re-tx, increased R MELD, R Age, D Age and decreased D weight were risk factors for increased LOS. Conclusions: The influence of recipient and donor factors on LOS varies by institution. This may reflect programmatic differences in practice patterns, maturity, philosophy, and geography. Donor age and non-local donors influence LOS for the combined cohort, yet DRI, encompassing multiple donor variables did not impact LOS. Recipient MELD has a consistent and significant impact on LOS for both institutions emphasizing the dominant role of recipient disease severity on LOS and presumably resource use following OLT.

REGIONAL DIFFERENCES IN DECEASED DONOR LIVER UTILIZATION AND ORGAN WASTAGE

Paul H. Hayashi1, Paolo R. Salvalaggio2, David A. Axelrod3, Schnitzler Mark4; 1UNC Liver Program, University of North Carolina, Chapel Hill, NC; 2Surgery Department, Saint Louis University, St. Louis, MO; 3Transplantation Surgery, Dartmouth-Hitchcock Medical Center, Lebanon, NH; 4Center for Outcomes Research, Saint Louis University, St. Louis, MO

Background: There is significant regional variation in liver utilization criteria. Aim: To estimate the number of livers left untransplanted due to regional differences in organ use. Methods: We selected deceased persons successfully donating at least one solid organ between 7/15/00 and 7/17/05 from the UNOS database. Within each region, we performed logistic regression analysis for liver exported or not transplanted vs. local or regional transplant. Age, obesity, donation after cardiac death, donor ALT, bilirubin, anti-HCV (+), anti-HBc (+) and AB blood type were examined as predictors of export or liver not transplanted. With intent for best case scenario, we identified the most 'lenient' region(s) for regional liver use based on smallest predictor adjusted odds ratios (OR) and fewest significant predictors. We identified untransplanted livers from regions with stricter criteria for organ use, and determined the odds of being used by the more lenient region(s). For those with > 1.5 odds of being used by the more lenient region(s), we calculated donor risk indices (DRI's) for 6, 8 and 12 hour cold ischemia times. Results: Of 30,474 livers, 23,535 were transplanted within their region of procurement, while 1883 were exported and transplanted and 5056 were not transplanted. Older donor age was a significant predictor of non-use for all regions except Region 9 (age 50-60, OR=1.29, 95% CI: 0.8-2.2, p=0.34). Similarly, only Region 9 had predictors with smaller and fewer significant OR’s for non-use compared to all other regions (median OR: 1.4 vs 3.6; p<0.01; median number of significant ORs: 6 vs. 16; p=0.01). 4798 livers were left untransplanted from regions 1-8 and 10-11. 4,504 had >1.5 odds for being transplanted by the more lenient region(s).

Summary: Regional differences in criteria for liver use exist with the most lenient centers. Conclusions: Under the present system of regional differences in organ use, a small number of potentially usable livers are left untransplanted presumably due to fears of extended cold ischemia time or other non-captured variables (e.g. liver histology). Improved communication through a national, electronic sharing system that improves logistics and lowers cold ischemia time may increase transplants by only 2-3% in the best case scenario.
7

HEPATITIS C (HCV): 3 STUDY: DOES IMMUNOSUPPRESSION (IS) AFFECT THE PROGRESSION OF FIBROSIS OF HCV RECURRENCE AFTER LIVER TRANSPLANTATION (OLT)?

Aims: To assess the efficacy and the safety of a steroid (Pred)-free IS regimen using daclizumab (DAC), tacrolimus (TAC) and mycophenolate mofetil (MMF) to minimize the incidences of acute cellular rejection (ACR), HCV recurrence and adverse events post OLT. Methods: Open-label, prospective, multicenter study (n=18) involving 312 adult HCV-OLT recipients randomized, pre-OLT (1:1:2), to 3 IS arms (see Results). Laboratory data and liver histology were obtained when clinically indicated and, by protocol, at days 90, 365 and 730. Protocol biopsies were successfully accomplished in: 81%, 69% and 54%, respectively. ACR was graded by Banff schema. HCV recurrence was staged by Batts and Ludwig classification. Clinically significant primary endpoints: ACR (Grade ≥2 + RAI ≥4) and/or HCV recurrence (Stage ≥2 or Grade ≥3 at any time). Significant statistics: p ≤ 0.05. Results: 312 patients were studied. Arm 1 (n=80): TAC + Pred; Arm 2 (n=79): TAC + Pred + MMF; Arm 3 (n=153): DAC (3 doses, post op. days: 1, 3 and 8th) + TAC + MMF. All data (intention to treat [ITT]; central protocol [PP]/CP and PP/LP). No differences across arms were found for HCV RNA levels at any time point. Similar death causes: HCV recurrence (5, 2, 4), respiratory (1, 5, 4), malignancy (2, 4, 1), sepsis (2, 1, 3); others (5, 2, 6). Conclusions: This 2-year report suggests that recurrence of HCV is not affected by immunosuppression. However, the rate of progression to stage ≥3 fibrosis, in year 2, may be influenced by the presence of MMF and steroids. Longer-term follow-up is indispensable to confirm these initial findings on HCV recurrence.

9 ERYTHROPOETIN IMPROVES LIVER REGENERATION OF THE DONOR AND RECIPIENT IN A RAT MODEL OF LIVING RELATED LIVER TRANSPLANTATION

Maximilian Bockhorn1, Christian Fingas1, Ursula Rauen2, Andreja Frilling1, Christoph E. Broelsch1, Joerg F. Schlaak3; 1General and Transplantation Surgery, University Hospital, Essen, Germany; 2Physiological Biochemistry, University Hospital, Essen, Germany; 3Gastroenterology and Hepatology, University Hospital, Essen, Germany

Introduction: Living donor liver transplantation (LDLT) has become an important procedure to overcome the growing organ shortage. In this setting, the unique regenerative capacity of the liver is vital for the clinical outcome of donor and recipient. Insufficient liver regeneration is still a major problem in LDLT. Recently, it has been stated that erythropoietin (EPO) has a wide range of non-erythropoietic functions. Aim of our study was to investigate the potential role of EPO as an exogenous stimulator for liver regeneration in the clinical context of LDLT. Material and Methods: Donor male Lewis rats were preconditioned with a dose of 1 I.E. EPO/g/BW i.p. at the 12th, 11th and 10th preoperative day. Recipient or resected rats received EPO at a dose of 5 I.E./g/BW i.v. perioperatively when undergoing partial liver transplantation (pLTx), 70% or 90% partial hepatectomy (PH). Controls were treated with heat-inactivated EPO in the same vehicle at the same timepoints. Samples were taken to investigate liver serum and functional parameters, liver body weight ratio (LBWR), hepato-sinusoid index (4.6 ± 0.3 vs. 3.56 ± 0.15; p<0.05), which occurred subsequently to the increase in Ki-67 proliferation index (4.6 ± 1.3 vs. 1.1 ± 0.5; p<0.001) in the intact, non-resected liver. Exogenous administration led to an improved liver regeneration as shown by increased Ki-67 proliferation index, LBWR and serum parameters such as AST, ALT, GLDH and bilirubin as well as PTT and INR 24h and 5 days after pLTx, 70% or 90% PH compared to control rats. Mechanistically, EPO markedly prevented the apoptosis of hepatocytes 24h after pLTx. Treatment with EPO led to a significantly improved overall survival after 90% PH (88% vs. 58%, p<0.05). Furthermore we demonstrated an 88% (7/8) survival in rats receiving EPO compared to only 38% (3/8) in rats with vehicle 28 days after pLTx. (p=0.03). Discussion: We have shown that exogenous administration of EPO induces a proliferative response in hepatocytes resulting in an improved liver regeneration following 70% PH and 90% PH. Furthermore, using this dose regimen, EPO-treated rats had a statistically significant improved overall survival after pLTx.

10 OUTCOMES AFTER HEART TRANSPLANTATION AMONG RECIPIENTS WITH CHRONIC HEPATITIS C INFECTION

Tse-Ling Fong1, James Cicciarelli2, Yong-Won Cho3; 1University of Southern California, Los Angeles, CA; 2National Institute of Transplantation, Los Angeles, CA

BACKGROUND: Prior studies examining the impact of hepatitis C infection (HCV) after heart transplant (OHT) do not differentiate between pre-existing chronic HCV infection (prior to OHT) or de-novo acquisition of HCV during or following OHT. Despite the paucity of data regarding the outcomes of heart transplant recipients who are HCV-positive prior to transplant, many transplant centers are declining to perform OHT on HCV-positive patients based on the experience of using HCV-negative allografts in HCV-negative recipients which is associated with decreased survival. AIM: This study was undertaken, utilizing the OPTN/UNOS database, to assess the clinical outcome of HCV-positive compared to HCV-negative heart transplant recipients. METHODS: Outcomes for OHT recipients are affected by the era of transplantation and immunosuppression. Therefore, analysis was limited to the five-year period between January 1, 2000 and December 31, 2005. 224 HCV-positive and 10,406 HCV-negative recipients who received HCV-negative donor organs were identified. Since co-morbid factors significantly influence early mortality rate after transplantation, logistic regression analysis was performed for early phase (6 months) and Cox regression analysis for late phase (beyond 6 months post-transplant). Outcome variables compared between the two groups included patient survival and acute rejection rates. RESULTS: Overall patient survival rates of HCV-positive recipients were significantly lower than those of HCV-negative recipients (88.0% at 1-yr, 83.4 3-yr, 74.2% 5-yr vs. 87.1% at 1-yr, 79.2% 2-yr and 72.6% 3-yr HCV-negative recipients, p<0.01). However, after adjusting for potential confounding factors including donor age, recipient sex, age, race, obesity, congenital heart disease, peak PRA, re-transplant, HBV core antibody positive, renal insufficiency, ICU and status 1A at time of transplantation), recipient HCV positive status was no longer a significant risk factor in either early or late phase (OR=1.22, p=0.356 for early phase and RR=1.36, p=0.091 for late phase (Table). Causes of death among HCV-positive and HCV-negative groups were similar. Cumulative incidence of acute rejection episode among HCV-positive recipients was 37.5% vs. 32.6% HCV-negative recipients (p=0.32). CONCLUSIONS: A more rational approach should be developed for the management of HCV-positive heart transplant candidates. Carefully selected HCV-positive patients should not be excluded from OHT.
A RANDOMIZED STUDY TO ASSESS THE SAFETY AND EFFICACY OF ADEFOVIR DIPIVOXIL SUBSTITUTION FOR HEPATITIS B IMMUNE GLOBULIN IN LIVER TRANSPLANTATION PATIENTS RECEIVING LONG-TERM LOW DOSE IM HBIG AND LAMIVUDINE PROPHYLAXIS

Peter W. Angus1, Simone I. Strasser2, Scott Patterson1, Geoff W. McCaughan2, Ed Gane3; 1Liver Transplant Unit, Austin Health, Melbourne, VIC, Australia; 2AW Morrow GE and Liver Centre, Royal Prince Alfred Hospital, Sydney, NSW, Australia; 3NZ Liver Transplant Unit, Auckland Hospital, Auckland, New Zealand

Combination hepatitis B (HBV) immune globulin (HBIG) and lamivudine (LAM) provides effective prophylaxis against graft re-infection following liver transplant (OLTx) but HBIG is expensive and inconvenient, necessitating long-term monthly clinic follow-up. The aims of this study were to determine the safety, efficacy and economics of substituting adefovir dipivoxil (ADV) for HBIG, whilst continuing LAM, in patients transplanted for HBV related liver disease. This was a randomized, prospective, multi-centre, open label study of adults at least 12 months post-OLTx for HBV disease who were receiving HBIG and LAM prophylaxis without recurrence of HBV infection in the graft. No OLTx grafts had been obtained from executed prisoners or other institutionalized persons. Patients were randomized (1:1) to receive ADV 10mg daily or to continue HBIG. LAM therapy was continued in both groups. Lactating or pregnant females as well as patients with HIV or a creatinine >180 µmol/L were excluded. All direct costs of antiviral prophylaxis were recorded (LAM, ADV, HBIG, clinic visits). Patients were reviewed at least 3 monthly until study completion. 34 patients were randomized: 16 to ADV/LAM (one withdrew consent after 2 months and is not included in the analysis) and 18 to continue HBIG/LAM. Patient groups at baseline did not differ significantly in time since OLTx, ALT, renal function, HBsAb titre, HBeAg status, Hepatitis C or D status, duration of prior antiviral therapy, or HBV DNA load at OLTx. One patient on ADV became HBsAg positive after 5 months but is persistently HBV PCR undetectable with a further 20 months of follow-up. All remaining patients are HBsAg and HBV DNA undetectable at a median of 17.2 months (range 7-31) from randomization. One patient on ADV had deterioration in renal function (creatinine 198 µmol/L from baseline 136 µmol/L in setting of diabetic nephropathy) requiring dose adjustment and ultimately ADV cessation after 15 months (peak creatinine 211 µmol/L). No other patient required dose adjustment (mean change in creatinine for other ADV patients +6 µmol/L). There were no further adverse events related to study therapy. Cost effectiveness analysis (using costs from the largest centre) is in favor of combination ADV/LAM therapy: $US 7,277 vs. $US 12,505 per treatment-year for LAM/HBIG (not including other societal costs). In adults more than one year post-OLTx for HBV disease who are without evidence of graft re-infection, switching from HBIG/LAM to ADV/LAM provides safe, effective and convenient protection against recurrent HBV. This strategy significantly reduces costs of long-term antiviral prophylaxis.

DECLINE IN THE NEED FOR LIVER TRANSPLANTATION FOR END STAGE LIVER DISEASE SECONDARY TO HEPATITIS B IN THE US

W. Ray Kim1, Joanne T. Benson1, Andrew Hindman2, Carol Bros- gart2, Carolyn Fortner-Burton2; 1Mayo Clinic College of Medicine, Rochester, MN; 2Gilead Sciences, Foster City, CA; 3United Network for Organ Sharing, Richmond, VA

Background/Aims: Liver transplant (LTx) physicians have anecdotally noticed that fewer patients seem to come to LTx for hepatitis B (HBV)-related end stage liver disease, coincident with widespread application of effective antiviral agents. We analyzed nationwide data on patients who were waitlisted for HBV-related liver disease in the US. Methods: All LTx candidates registered to the Organ Procurement and Transplantation Network for LTx between 1994 and 2006 were identified. All patients whose primary diagnosis included hepatitis B and/or hepatitis C (HCV) were included in the analysis. The outcome of waiting on the list was categorized into LTx, death and improvement. Results: The figure compares the number of registrants with HBV and HCV between 1994 and 2006. There was a rapid increase in the number of registrants with HBV and HCV in the 1990s. However, the number of registrants for HBV peaked in 2000 (n=586), which was followed by a 30% reduction in the ensuing 6 years (n=409 for 2006). This was in contrast to the number of registrants with HCV, which dipped in 2002 following implementation of MELD then regained its previous level. Among HBV patients, the proportion of registrants of Asian race increased from 12% to 35% and African race from 5% to 15% between 1994 and 2006. The proportion of HBV patients with HCC at the time of LTx increased from 8% to 12% over time. Conclusions: The number of patients registered for LTx in the US for decompensated liver disease secondary to HBV decreased substantially since 2000, a trend not mirrored in HCV. Many other epidemiologic explanations for this trend are feasible, but widespread application of antiviral agents may have contributed to the decreased incidence of decompensated liver disease.

MECHANISMS OF IMMUNE EVASION BY TRANSITION VARIANTS OF HEPATITIS C VIRUS

Jane H. Wang1,2, Matthew J. Pianko1, Xiaogang Ke2, Scott Cotler2, Peter F. Whilington1; 1Pediatrics, Division of GI, Hepatology & Nutrition, Northwestern University, Chicago, IL; 2Medicine, Section of Hepatology, University of Illinois at Chicago, Chicago, IL

Introduction: Antigenic variation is an effective way by which viruses evade host immune defence leading to viral persistence. Little is known about the inhibitory mechanisms of viral variants on CD4 T cell functions. Here we show evidence that naturally occurring antigenic variants of a CD4 epitope derived from hepatitis C virus (HCV) transform a protective peripheral Th1 immune response into an inhibitory Th3 and/or Tr1 response.

Methods: Peripheral blood mononuclear cells (PBMCs) from patients infected with HCV for less than 5 years were cultured with synthetic peptides of a CD4 epitope derived from the NS3 protein of HCV and its variant peptides with single or double amino acid substitutions. The experiments were evaluated by proliferation assay and flow cytometry with the cultured cells and cytokine ELISA with the cultured supernatant. Results: HCV variants resulting from single or double amino acid substitutions at the center of the core region of the Th1 peptide not only induce failed T cell activation and proliferation but also simultaneously up-regulate inhibitory cytokine IL-10, CD25-TGF-beta+ Th3 and CD4+IL-10+ Tr1 cells compared to wild type peptide. Other HCV variants tend to induce higher levels of TGF-beta that promote differentiation of CD25+ Th3 suppressors. Either CD25-TGF-beta+ or CD25+TGF-beta+ Th3 suppressors play a critical role in inhibition of T cell proliferation and cell contact is necessary for the inhibitory function of those Th3 cells. In addition, CD25+ cells stimulated by HCV variants showed characteristics of regulatory T cells supported by their expression of higher levels of the transcription factor forkhead box P3 (Foxp3) and cytotoxic T lymphocyte-associated antigen 4 (CTLA-4). In contrast, the wild type peptide down-regulated the expression of Foxp3 and CTLA-4 on CD25+ cells compared to cells cultured with medium alone. Discussion: Our data reveal multiple mechanisms of peripheral immune modulation initiated or enhanced by naturally occurring HCV variants of a CD4 epitope in the early course of HCV infection in humans. Because these CD4 variants can transform a protective peripheral Th1 immune response into an inhibitory Th3 and/or Tr1 response, we call them "transition variants". The modulation of transition variants on CD4 response is efficient and extensive, and is likely critical in viral persistence in HCV infection.

ENDOPLASMIC RETICULUM (ER) STRESS ASSOCIATED WITH DOWNREGULATION OF THE UNFOLDED PROTEIN RESPONSE (UPR) IN LIVERS OF PATIENTS WITH CHRONIC HEPATITIS C

Tarik Asselah1, Ivan Bièche2, Ingrid Laurendeau2, Dominique Cazals-Hatem3, Gérard Feldmann4, Pierre Bedossa5, Valérie Paradis1, Didier Lebrec1, Eric Ogier-Denis1, Abdel Mansouri1, Michel Vidaud5, Patrick Marcellin, Richard Moreau

In hepatocytes, the accumulation of unfolded proteins in the ER lumen causes ER stress that induces the UPR. The UPR is mediated by the activation of 3 ER-membrane proteins: ATF6, IRE1 and PERK. ATF6 induces XBP1 mRNA and IRE1 cuts XBP1 mRNA to produce spliced XBP1 mRNA which codes for the transcription factor XBP1[S] inducing EDEM mRNA (involved in degradation of unfolded proteins). PERK attenuates global protein synthesis. Since in vitro studies have shown that cells carrying hepatitis C virus (HCV) subgenomic replicons exhibit ER stress and an altered UPR, we aimed to investigate in vivo ER stress and the UPR in liver samples from patients with chronic hepatitis C (CHC). We used electron microscopy to study hepatocyte ER morphology in livers with mild CHC (n=6). Real-time RT-PCR was used to study the mRNA expression of 24 selected genes involved in the UPR in 34 individual liver samples (normal (n=6); HCV-related fibrosis (mild, n=13; advanced, n=15). Livers with mild hepatitis B virus (HBV)-related fibrosis (n=10) were also studied. In mild CHC, electron microscopy showed that most hepatocytes had ER stress because their granular ER was slightly dilated, disorganized, and scattered. In keeping with this, the ratio of spliced to unspliced XBP1 mRNA, a marker of ER stress-elicited IRE1 activity, was significantly higher in liver samples with mild fibrosis than in normal livers. However, the relative levels of EDEM mRNA, a prototypical XBP1[S] target, were not induced in mild fibrosis suggesting a defect of the IRE1 pathway downstream of XBP1 mRNA splicing. The levels of ATF6-dependent mRNAs, i.e., XBP1, GRP78, GRP94, calnexin, calreticulin, SERCA2 were not significantly altered in livers with mild fibrosis, indicating that ER stress did not result in ATF6 activation. Moreover, in these livers, we found evidence of a defect in the PERK pathway because there was a significant decrease in the relative levels of GADD34 mRNA and no induction of the proapoptotic CHOP mRNA. In HCV-related advanced cirrhosis, we found a more marked defect in the IRE1 and ATF6 pathways. In livers with HBV-related mild fibrosis, we only found a decrease in XBP1 mRNA levels. Interestingly, CREB4, an hepatocyte-specific gene, which links ER stress to the hepatic acute-phase response, was induced in HCV-related fibrosis (mild and advanced) but not in HBV. In both HCV- and HBV-related fibrosis, NF-kB and AP1 target mRNAs were activated. In conclusion, livers from patients with CHC exhibit ER stress and downregulation of the 3 arms of the UPR. These results which seem specific for HCV, suggest that UPR downregulation allows unrestricted synthesis of HCV proteins in hepatocytes.

PP2A OVEREXPRESSION IN CHRONIC HEPATITIS C INHIBITS INSULIN SIGNALING IN THE LIVER

Christine Bensmeeer1, Francois Duong1, Verena Christen1, Luigi Terracciano2, Markus Heim1, 1Gastroenterology and Hepatology, University Hospital Basel, Basel, Switzerland; 2Institute of Pathology, University Hospital Basel, Basel, Switzerland

Background: Epidemiologic studies suggest a direct role of HCV in insulin resistance development and type 2 diabetes. Moreover presence of insulin resistance and diabetes are risk factors for fibrosis progression and nonresponse to antiviral therapy in chronic hepatitis C (CHC). In previous publications we have shown that protein phosphatase 2A (PP2A) is overexpressed in liver biopsies from patients with chronic hepatitis C and inhibits interferon alpha signaling. Interestingly, PP2A has been described to inhibit also insulin signaling in adipocytes. Moreover, some experimental data suggest that HCV interferes with the insulin signaling cascade. We therefore tested if HCV...
induced hepatic PP2A overexpression not only inhibits interferon signaling but also insulin signaling. Methods: We studied insulin signaling in UPP2AC8 and UHCv57.3 cells, that allow the inducible overexpression of PP2Ac and HCV proteins, respectively. Insulin signaling was further studied in the liver of HCV transgenic mice and in human liver biopsies. Results: In cell culture we observed inhibition of insulin signaling by overexpression of PP2A at the level of PKB/Akt phosphorylation. Inhibition of PKB/Akt phosphorylation in response to insulin was also observed in HCV transgenic mice. In liver biopsies from HCV patients we confirmed PP2A overexpression and found inhibition of PKB/Akt phosphorylation in response to insulin treatment. Furthermore, AMPK (adenosine monophosphate-activated protein kinase) phosphorylation was also regulated by PP2A cells and was reduced in HCV transgenic mice. Conclusion: HCV induced PP2A interferes with insulin and AMPK signaling promoting insulin resistance in hepatocytes. This mechanism could explain the high prevalence of type 2 diabetes in patients with CHC.

16 IFN-α AND TGF-BETA MODULATE THE CELLULAR UPTAKE OF HEPATITIS C VIRUS
Anna Tietjens1, Philip Hilgard1, Jean Dubuisson2, Guido Gerken1, Joerg F. Schlaak1; 1Dept. for Gastroenterology and Hepatology, University-Hospital Essen, Essen, Germany; 2CNRS-UMR8161, Institut de Biologie de Lille, Institut Pasteur de Lille, Lille, France

Background. Although IFN-α has been used for the treatment of HCV for more than 15 years, its antiviral mechanism of action is still largely hypothetical. Preliminary data utilizing genome-wide expression profiling by microarray analysis, suggested an influence of IFN-α on the expression of potential HCV binding cell surface molecules. Therefore, the aim of this study was to determine the influence of IFN-α on HCV uptake into liver cells and whether this process could be further modulated by the anti-inflamatory cytokines such as TGF-β. Materials and Methods. Huh-7 human hepatoma cells were treated with IFN-α for 8, 12, 24 or 48 h, respectively, and then incubated with MLV (mouse leukemia virus)-HCV pseudoparticles (HCVpp) expressing the viral envelope glycoproteins for 4 h to achieve complete infection. Infection was measured by luciferase assay 48 h later as well as by quantification of early reverse-transcribed long terminal repeats (LTR) of MLV by quantitative real-time PCR assay after 4 h of contact with target cells. Results. Pretreatment of Huh-7 with IFN-α for 24 or 48 h resulted, in a dose dependent manner, in a significantly decreased luciferase activity and LTR detection, initially leading to the suggestion that HCV binding or uptake is reduced by the cytokine. However, after 8 or 12 h of IFN-α pretreatment, LTR detection revealed a strong transient increase in the pseudoparticles. To elucidate the possible underlying molecular mechanisms, IFN-α induced modulation of the expression of cell surface molecules involved in HCV uptake (CD 81, SR-BI, Claudin-1) was studied. Consistent with the findings above, SR-BI expression was elevated during the first 12 hours of IFN treatment followed by a marked suppression thereafter. In contrast, Claudin-1 expression was not altered by IFN treatment. Pretreatment of hepatoma cells with the anti-inflammatory cytokine TGF-beta prior to addition of IFN-α counteracted the IFN-induced decrease of HCVpp uptake and showed a 4 fold increase of HCVpp after 24 h. Conclusions. These results show, for the first time, that IFN-α and other anti-inflammatory cytokines such as TGF-beta might deploy their antiviral activity not only by inhibition of HCV replication, but have the potential to additionally modulate the initial steps of infection, thereby contributing to disruption of the infection-reinfection cycle of the virus.

17 DEFECTIVE T HELPER 1 RESPONSE BY HEPATOCE- STIMULATED CD4 T CELLS IMPAIRS ANTI-VIRAL CD8 RESPONSE AND VIRAL CLEARANCE
Johannes Herkel1, Christiane Wiegard1, Petra Wolin2, Christian Frenzel1, Edgar Schmitt2, Annette Oxenius2, Ansgar W. Lohse1; 1Department of Medicine I, University Medical Centre Hamburg-Eppendorf, Hamburg, Germany; 2Institute of Microbiology, Swiss Federal Institute of Technology, Zurich, Switzerland; 3Institute of Immunology, Johannes Gutenberg-University, Mainz, Germany

Background: During hepatitis, hepatocytes gain the ability to express major histocompatibility complex (MHC) class II molecules and to present antigen to CD4 T cells. Here, we investigated whether MHC class II-expressing hepatocytes influence virion the differentiation of CD4 T cells, and in vivo the T cell response to and control of viral infection. Methods: Class II transactivator-transgenic hepatocytes, which constitutively express MHC class II molecules (Hepatology 37:1079-85), were used to stimulate CD4 T cells in vitro, and the effector response type of the stimulated CD4 T cells was determined. In vivo relevance of the obtained findings was confirmed by infecting non-transgenic or class II transactivator-transgenic mice with lymphocytic choriomeningitis virus (LCMV). Results: MHC II-expressing hepatocytes induced T helper (Th) 2 differentiation of uncommitted CD4 T cells and abrogated the ability of previously differentiated Th1 cells to secrete interferon-gamma, even in the presence of pro-inflammatory microbial signals. The suppression of Th1 responses by hepatocytes was associated with poor expression levels of Th1 promoting Delta-like Notch-ligands. In vivo, MHC II-expression by hepatocytes impaired the interferon-gamma production by LCMV-specific CD4 and CD8 T cells and prolonged viral persistence. Conclusions: By instructing infiltrating CD4 T cells to differentiate into a less inflammatory phenotype, MHC II-expressing hepatocytes seem to impair anti-viral CD8 T cell responses and viral clearance. Thus, hepatocytes may contribute to chronicity of hepatitis virus infection.

called these ‘exposed uninfected’ (EU) cases and have studied them for evidence of HCV-specific T cell responses as a marker of HCV exposure and potential resistance to infection. Methods: 40 EU cases were studied. All tested negative for HCV antibodies and HCV RNA. Details of injecting behaviour were ascertained by structured questionnaire. Peripheral blood mononuclear cells (PBMC’s) were isolated and interferon-gamma (IFN-g) production in response to a range of HCV proteins (Core, NS3, NS4, NS5) was assessed by Enzyme Linked Immunospot Assay (ELISpot) and compared with 21 healthy controls. Flow cytometry was used to characterise circulating CD4 memory subsets in a proportion of EU cases and compared with chronic HCV cases. Results: All EU cases reported sharing needles or other injecting paraphernalia. The mean duration of drug injecting was 9.3 years (0.5 - 26 years) with a mean estimated number of injection episodes of 9310 (range 156 to 28,470). Of the 40 EU cases 22 (55%) produced IFN-g in response to HCV proteins compared to 3 (19%) of the 21 controls (p = 0.002). 8 EU cases responded with IFN-g production to two or more HCV antigens compared to none of the controls (p=0.02). IFN-g production was found most frequently in response to NS3. Core (p = 0.01), NS3 (p=0.04) and NS5 (p=0.03) elicited stronger responses in EU cases than controls. Characterisation of CD4 memory subsets showed that, EU cases, like healthy controls, had a higher proportion of circulating naïve CD4 cells (CD45RA +ve, CD62L +ve)(p=0.03) and a lower proportion of effector cells (CD45RA +ve, CD62L -ve) (p=0.007) than chronically infected HCV cases. Conclusion: The majority of long-term IDU’s who remain uninfected by HCV have demonstrable HCV-specific T cell responses. This contrasts with controls where such responses are rarely seen and weaker. CD4 phenotyping in EU cases is distinct from chronically infected HCV cases, suggesting that these individuals are truly naïve for HCV infection. Whilst cross-reactivity to other commonly encountered antigens could be an explanation for finding these T cell responses, the frequent demonstration of responses to two or more HCV proteins makes this unlikely. We think that these responses represent an immunological footprint of HCV exposure that has not resulted in viraemia or HCV antibody seroconversion. The potential role of these responses in protecting from HCV infection is of great interest.

19 PREDICTORS OF DROPOUT FROM TRANSPLANT WAITING LIST AMONG PATIENTS LISTED FOR HEPATOCELLULAR CARCINOMA USING THE UNOS/OPTN DATABASE
Carlos J. Romero-Marrero1, Sherry Fu2, Veena Thyagarajan2, Robert J. Fontana2, Anna S. Lok2, Shawn Pelletier3, Jorge A. Marrero2; 1Internal Medicine, Division of Gastroenterology, University of Puerto Rico, San Juan, PR; 2Internal Medicine, Division of Gastroenterology, University of Michigan, Ann Arbor, MI; 3Surgery, Division of Transplantation, University of Michigan, Ann Arbor, MI

Background: Liver transplantation (OLT) is an excellent treatment for selected patients with hepatocellular carcinoma (HCC) with 5-year survival rates between 60%-75%. Previous single center studies have studied predictors of dropping out from the waiting list. The aim of this study was to determine the risk factors for dropout among HCC candidates in the transplant waiting list utilizing the entire US transplant database. Methods: We analyzed the UNOS/OPTN database from 1998-2006 for all patients listed for a primary, secondary or tertiary diagnosis of HCC. Demographic, laboratory, clinical, and tumor character-istics were obtained at the time of listing. Among dropouts, only patients withdrawn from the waiting list due to tumor progression and/or death were evaluated. Kaplan-Meier and Cox regression was utilized to determine independent factors of dropout. Results: A total of 4482 patients have been listed for HCC since 1998. Of these, 766 (17.1%) patients dropped out due to tumor progression or death. The median time before removal from waiting list for death or tumor progression was 140 days (range 1-1928 days), shorter in the post-MELD era (176 days pre-MELD vs. 74 days post-MELD, p<0.0001). In the univariate analysis, age > 55 years, AFP (alpha-fetoprotein) > 20 ng/ml, non-viral etiology, Child class, MELD score > 10, tumor size > 2.5 cm, Region 9 (New York, Western Vermont), portal vein thrombosis, and pre-MELD liver allocation era increased the risk of dropping out; while Region 3 (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi and Puerto Rico) and meeting Milan criteria were protective against dropping out from the transplant waiting list. The multivariate analysis is shown in the table below. Conclusion: In the largest study to date, approximately 17% of patients with HCC dropped out from the liver transplant waiting list in the US due to death or tumor progression. Advanced liver failure, non-viral etiology and region 9 were associated with increase risk of drop out, while meeting Milan criteria at listing and Region 3 were associated with decrease risk of drop out.

20 PROSPECTIVE VALIDATION OF AASLD GUIDELINES FOR THE EARLY DIAGNOSIS OF HEPATOCELLULAR CARCINOMA IN CIRRHOTIC PATIENTS
Angela Sangiovanni1, Matteo A. Manini1, Raffaella Romeo1, Massimo Iavarone1, Mirella Fracquelli2, Laura V. Forzenigo2, Guido Ronchi1, Massimo Colomba1; 1A.M. & A. Migliavacca, First Division of Gastroenterology, Fondazione IRCCS Maggiore Hospital Policlinic, Mangiagalli & Regina Elena, University of Milan, Milan, Italy; 2Second Division of Gastroenterology, Fondazione IRCCS Maggiore Hospital Policlinic, Mangiagalli & Regina Elena, University of Milan, Milan, Italy; 3Division of Radiology, Fondazione IRCCS Maggiore Hospital Policlinic, Mangiagalli & Regina Elena, University of Milan, Milan, Italy

Background: Confident diagnosis of hepatocellular carcinoma (HCC) is currently based on both invasive and non invasive criteria with dynamic imaging. Aim: We prospectively evaluated the diagnostic accuracy of contrast-enhanced ultrasound (CE US), dynamic computed tomography (CT) and dynamic magnetic resonance (MR) in cirrhotic patients with de-novo liver nodes (LN) detected during surveillance. Patients/Methods: 38 patients with Child-Pugh A cirrhosis (44 to 76 yr), 26 (68%) males, under US surveillance at 6-month intervals who developed a LN underwent CE US, spiral TC, MR and fine-needle biopsy (FNB). FNB was the diagnostic gold standard. Results:
40 LN were identified: 1 (2.5%) <1cm, 35 (87.5%) 1-2cm, 4 (10%) >2cm. 20 (50%) hepatocellular carcinoma (HCC), 1 (5%) <1cm, 16 (80%) 1-2cm, 3 (15%) >2cm; 1 (2.5%) cholangiocarcinoma; 16 (40%) macroregenerative nodules; 3 (7.5%) low grade dysplastic nodes. Among 1-2cm LN, a typical vascular pattern for HCC, defined by contrast uptake in arterial phase and wash-out in the portal/venous phase, was detected in 5 (14%) by CE US, in 7 (20%) by CT, in 6 (18%) by MR, all techniques showing absolute specificity for HCC. 10 HCC patients (62%) had typical vascular pattern for HCC with one of these techniques whereas 6 (38%) showed a coincidental typical vascular pattern with two techniques (AASLD criteria). Conclusion: Among patients with de-novo LN of 1-2 cm, one technique may confidently allow for non invasive diagnosis of HCC in patients under surveillance, thus sparing liver biopsy in a quarter of patients.

22. ONCOCGENIC PATHWAYS AND NEW THERAPEUTIC TARGETS ARE SPECIFICALLY ACTIVATED IN THE DIFFERENT HEPATOCELLULAR ADENOMA SUBTYPES OF TUMORS

Sandra Reboissou1, Sandrine Imbeaud2, Cristel Thomas1, Charles P. Balabaud3, Paulette Bioulac-Sage4, Jessica Zucman-Rossi1; 1U674, Inserm, Paris, France; 2Array s/IMAGE, Genexpress, CNRS, Villejuif, France; 3Hôpital Saint André, CHU Bordeaux, Bordeaux, France; 4Hôpital Pellegrin, CHU Bordeaux, Bordeaux, France

Recent path-molecular classification of hepatocellular adenoma (HCA) identified 3 groups of lesions defined by either HNF1α inactivating mutations, β-catenin activation or the presence of inflammatory infiltrates. Genotype-phenotype analysis showed that each group of HCA was related to a specific tumor phenotype and malignant transformation was more frequent in β-catenin activated HCA. To better understand the physiopathology of the three defined subtypes of HCA, we performed a transcriptomic analysis. We compared the expression profile of more than 15,000 genes in normal livers with those of HNF1α-mutated (n=8), β-catenin mutated (n=3) and inflammatory (n=7) HCA. The most relevant deregulated pathways identified were further validated by quantitative RT-PCR and western-blotting experiments in an additional series of 40 tumors. In HNF1α-mutated HCA, we identified a strong over-activation of mTOR, a key pathway for cell survival. Phosphorylated mTOR and its targeted proteins, were over-expressed leading to the activation of the translational machinery. In addition, these tumors showed an over-expression of several onco genes such as cyclinD1 and EEF1A2 that may contribute to cell proliferation. We also found an aberrant induction of glycolysis and lipogenesis, that may explain the severe steatosis constantly observed in HNF1α inactivated HCA. In β-catenin mutated HCA, transcriptional deregulations affected mainly amino acid metabolism predicting impaired amino acid catabolism and an increased rate of glutamine synthesis. Most of the known β-catenin targeted genes were found over expressed in these particular HCA and interestingly, we also found a recurrent overexpression of the mTOR pathway. In contrast, inflammatory HCA showed a dramatic deregulation of the inflammatory response that may contribute to cell proliferation. We found a constitutive activation of the IL-6, type 1 and 2 interferon pathways, a downstream induction of the acute phase response and of the antigen presentation machinery. Using immunohistochemistry, we found the over-expression of SAA, a target of the acute phase response, restricted in tumor hepatocytes without reinforcement beside the lymphocytic infiltrates. In conclusion, in each HCA subtype, we identified a specific combination of alterations disturbing the energetic metabolism, cell survival and cell proliferation. While inhibitors of mTOR, β-
catenin and inflammatory pathways are already available or under development, our findings could open the way to a future “à la carte” management of HCA, particularly useful in case of multiple adenomas and adenomatosis.

23 CLINICAL SAFETY AND BIOACTIVITY OF OK432-STIMULATED DENDRITIC CELL TRANSFER INTO HEPATOCELULAR CARCINOMA FOLLOWING TRANSCATHETER HEPATIC ARTERIAL EMBOLIZATION

Yasunari Nakamoto1, Eishiro Mizukoshi2, Masaaki Kitahara1, Yoshio Sakai1, Kaeheita Kakinoki3, Kuniaki Arai1, Tatsuya Yamashita1, Naofumi Mukaida1, Kouji Matsushima2, Osamu Matsui1, Shuichi Kaneko3; 1Kanazawa University, Kanazawa, Japan; 2University of Tokyo, Tokyo, Japan; 3University of Tokyo, Tokyo, Japan

BACKGROUND: The curative treatments for hepatocellular carcinoma (HCC) including surgical resection and radiofrequency ablation (RFA) do not effectively prevent tumor recurrence. Dendritic cell (DC)-based immunotherapies are believed to contribute to the eradication of the residual and recurrent tumor cells. Recently, we have developed the combination therapy of transcatheter hepatic arterial embolization (TAE) with immature DC infusion (n=13) in comparison with the historical control group (n=10) monitored clinically and biochemically after the OK432-stimulated DC infusion for HCC (Clin. Exp. Immunol. 147:296-297, 2007). The current study was designed to assess the safety and bioactivity of infusion of DCs stimulated with OK432, a Streptococcus-derived anticancer immunotherapeutic agent, to tumor tissues following TAE treatment for patients with cirrhosis and HCC.

METHODS: Adherent cells isolated from peripheral blood mononuclear cells (PBMCs) of patients with hepatitis C virus-related cirrhosis and HCC were cultured and differentiated into DCs in the presence of IL-4 and GM-CSF. OK432 was added at a concentration of 1.0 KE/ml on day 5. Subsequently, 5 x 10^6 of DCs were administered through arterial catheter during the procedures of TAE treatment on day 7. The adverse events were monitored clinically and biochemically after the OK432-stimulated DC infusion (n=13) in comparison with the historical controls that were treated with immature DC infusion (n=10) or TAE alone (n=11). To evaluate the immunomodulatory effects of DCs, PBMCs were pulsed with 42 of defined tumor antigenic peptide epitopes, and the epitope-specific T lymphocyte responses were quantitated in an IFN-γ ELISPOT assay.

RESULTS: DCs obtained from each study patient were shown to express MHC class II (HLA-DR) and B7-2 (CD86) in the absence of mature monocytes (CD14) in flow cytometric analysis. In contrast to immature DCs, OK432-stimulated cells highly expressed the activation markers CD83 and CD86. There was no clinical or serological evidence of the adverse events including hepatic failure and autoimmune responses in any patients in addition to those due to TAE. Interestingly, the T lymphocyte responses were induced against peptides derived from tumor antigens, AFP, hTERT, SART2 and MRP3, after the infusion in some patients. Furthermore, the time course analysis indicated that these T cell responses were elevated four weeks after DC infusion and minimized three months later.

CONCLUSIONS: Transcatheter arterial infusion of OK432-stimulated DCs following TAE treatment is feasible and safe for patients with cirrhosis and HCC. Furthermore, the antigen-nonspecific DC infusion into HCC tissues may induce the immune responses to unprimed tumor antigens, providing a plausible strategy to enhance tumor immunity.

24 DIFFUSION-WEIGHTED MRI FOR DETECTION OF HEPATOCELLULAR CARCINOMA IN PATIENTS WITH HEPATIC CIRRHOSIS: A CORRELATION TO HISTOLOGY AND IMAGING FOLLOW-UP

Chris Verslype1, Frederik De Keyzer2, Louis Libbrecht3, Tania Roskams3, Ilse Roeben2, Steven Dymarkowski2, Jacques Pirenne4, Frederik Nevens5, Vincent Vandecaveye6; 1Hepatology, University Hospital Leuven, Leuven, Belgium; 2Radiology, University Hospital Leuven, Leuven, Belgium; 3Pathology, University Hospital Leuven, Leuven, Belgium; 4Abdominal Transplant Surgery, University Hospital Leuven, Leuven, Belgium

Background/aim. Survival of patients with hepatocellular carcinoma (HCC) depends on the number and size of lesions, requiring detection at early stage of disease. The aim of the study was to evaluate diffusion-weighted magnetic resonance imaging (DW-MRI) for detection of HCC and/or evolutive lesions. Materials and methods. A 1.5 Tesla MRI was performed in 54 patients. An echo-planar DW-MRI with b-values ranging from b0 to b1000 was added to the conventional sequences. Signal intensity (SI) of solid liver lesions was measured for b0, b300, b600 and b1000 on native DW-MRI images. Apparent diffusion coefficient (ADC) maps were calculated for the entire b-value range (ADCavg) and for the high b-values [b>500 sec/mm2, ADChigh]. In 29 patients SI for b0, b300, b600 and b1000 and ADC-values of identified lesions were correlated to histopathology (50% explant livers; 50% resection or biopsy). In 23 additional patients, the imaging findings were correlated to lesion evolution on imaging follow-up (without performing histopathology). Sensitivity and specificity of DW-MRI was calculated using an optimal threshold and compared to T2- and contrast-enhanced T1-weighted sequences. Results. 72% of lesions were 2 cm or smaller: 153 old and compared to T2- and contrast-enhanced T1-weighted sequences. In comparison, T2-weighted imaging had a sensitivity of 76% and specificity of 94%, Contrast-enhanced T1-weighted imaging had a sensitivity of 87% and specificity of 76%. The SI on b0, ADCavg- and ADChigh-value showed no significant difference for any lesion type (P>0.05). Conclusions. DW-MRI using SI at b600 showed the highest sensitivity and specificity for detection of HGDN and HCC and correlated significantly with early lesion progression. This higher accuracy for detection of HGDN and HCC and progressive lesions may help in treatment or transplant planning.

Introduction: Recurrent HCV infection after OLT can cause graft failure and death, but safety concerns have limited prophylactic/early treatment with pegylated interferon/ribavirin. The Phoenix trial was designed to compare prophylactic administration of antiviral therapy before histological recurrence of HCV (Prophylaxis arm) with initiation of antiviral therapy only at the time of histologically apparent recurrence of HCV (Observation arm). Methods: Patients were randomized 10:26 wks after OLT. Patients in the Prophylaxis arm received 135 µg peginterferon alfa-2a/wk for 4 wks and 180 µg/wk for 44 wks; plus 400 mg/d ribavirin (initial dose), escalating to 1200 mg/d, for 48 wks, followed by 72 weeks of treatment free follow-up. Patients in the Observation arm were treated with the same regimen only upon histologic recurrence of HCV (HAI >3 and/or FS >2), followed by 24-72 weeks of treatment free follow-up. The primary efficacy assessment is the proportion of patients in each group who experienced histological evidence of HCV recurrence at 120-weeks post-randomization. Here we report 24-wk interim data. Results: To date, 55 patients have been randomized to the Prophylaxis arm and 60 to the Observation arm; of the latter, 12 (20%) have started treatment due to meeting criteria for histological recurrence and have completed 12 weeks of treatment. At weeks 4, 12, and 24, respectively, 4 (7.3%), 12 (21.8%), and 21 (38.2%) patients in the Prophylaxis arm were HCV negative, as were 0 (Week 4) and 4 (33.3%; Week 12) patients in the Observation arm who started delayed treatment. Of patients in the Prophylaxis and Observation arms, 53 (98.1%) and 55 (91.7%), respectively, have experienced at least 1 adverse event (AE); and 23 (42.6%) and 14 (23.3%), respectively, have experienced at least 1 serious AE. ACR was experienced by 2/54 (3.7%) patients in the Prophylaxis arm and 3/48 (6.3%) untreated patients in the Observation arm, and significant infections by 4/54 (7.4%) and 1/48 (2.1%), respectively; clinically significant depression was not observed in either arm. Although anemia (16.7% vs 2.1%) and grade 3/4 neutropenia (16.7% vs 8.3%) were higher in the Prophylaxis arm than in untreated patients in the Observation arm, these AEs were likely related to treatment. Conclusion: After 24 weeks of treatment, 38.2% of patients in the Prophylaxis arm were HCV RNA negative. Although AEs were common during prophylaxis for post-OLT HCV recurrence, the incidence of clinically significant ACR was not increased by prophylaxis. These findings suggest that peginterferon alfa-2a/ribavirin prophylaxis is relatively safe and effective in OLT recipients.

Intensive Dietary Treatment in Living Donor Liver Transplantation in Adults

Riccardo Volpes1,2, Lisa Randisi1,2, Salvatore Gruttadauria1,2, Marcello Castellese1,2, Maria Rubino1,2, Marida Minervini1,2, Giovanni Vizzini1,2, Bruno Gridelli1,2, 1ISMETT, Palermo, Italy; 2UPMC, Pittsburgh, PA

A living donor liver transplant (LDLT) program has been developed in our Center as an alternative for recipients who would have limited or delayed access to a cadaveric organ. Around 20% of our total liver transplant activity currently comes from living donors. A comprehensive step-by-step work-up protocol for donor evaluation is designed to ensure donor safety and to guarantee donor capability to provide a suitable graft. The usefulness of steatotic livers depends on the fat percentage, being graft and patient survival decreased by donor steatosis >30%. Body Mass Index (BMI) >30 may reliably predict higher degree of steatosis in most donors. In order to enlarge the pool of living donors and may be therefore useful to increase the organ pool without affecting the donor and recipient safety.

Results:
Successful completion of the 3-month treatment (BMI <30), a liver biopsy was performed. In all 7 treated donors steatosis <30% was found, and they were considered eligible for donation. After LDLT, none of such donors experienced life-threatening complications or died. Liver function of both resected donors and transplanted graft showed a good outcome, with no differences (in term of hospital LOS, liver functional parameter normalization after resection, and liver regeneration) between them and other LDLT without hepatic steatosis. Treated fat donors showed no long-term clinical impairment, and all of them returned to previous activity after donation. In conclusion, donor livers with <30% steatosis are usable and anticipated to have good function. A short-term dietitian intensive regimen for fat donors seems to be effective in lowering hepatic steatosis by reaching such acceptable histological cutoff. This approach may provide a way for persons with steatosis to be successful liver donors and may be therefore useful to increase the organ pool without affecting the donor and recipient safety.

28 SURVIVAL AND RISK OF HEPATITIS B VIRUS (HBV) RECURRENCE IN HIV-HBV COINFECTED LIVER TRANSPLANT RECIPIENTS: PRELIMINARY FINDINGS FROM THE HIV-TR STUDY

Carla S. Coffin1, Carl L. Berg2, Lorna M. Dove3, Fred Poordad4, Michael P. Curry5, Fredric G. Regenstein6, Kenneth E. Sherman7, Michelle E. Rolan8, Peter G. Stock9, Norah Terrault1,2, 1Medicine, University of California San Francisco, San Francisco, CA; 2Surgery, University of California San Francisco, San Francisco, CA; 3Medicine, University of Virginia, Charlottesville, VA; 4Medicine, Columbia University, New York, NY; 5Medicine, Cedars-Sinai, Los Angeles, CA; 6Medicine, Harvard School of Medicine, Boston, MA; 7Medicine, Tulane University, New Orleans, LA; 8Medicine, University of Cincinnati, Cincinnati, OH

Background: Liver transplantation (LT) is the treatment of choice for HBV-infected patients with end stage liver disease, but the outcome of LT in HIV+ patients may be complicated by HIV disease progression and/or recurrent liver disease post-LT. Aims: To evaluate the safety and efficacy of LT for HBV-infected patients with end stage liver disease, but the outcome of LT in HIV+ patients may be complicated by HIV disease progression and/or recurrent liver disease post-LT.

Methods: Multicenter prospective cohort study of HIV-HBV coinfected patients in the “Solid Organ Transplantation in HIV Study” (HIV-TR) undergoing LT from 2003-2007. HIV-specific criteria included undetectable HIV viral load if on antiretrovirals (ARV) or prediction of full suppression post-LT if unable to tolerate ARV and CD4 cells >100/mm3, or >200/mm3 if there was a history of opportunistic infections or neoplasms. Standardized post-LT HBV prophylaxis included hepatitis B immunoglobulin (HBIG) & antivirals: tenofovir with lamivudine (LAM) or emtricitabine. Sera were collected pre-transplant, 12, 26, 52 wks & yrs post-LT. We assessed patient and graft survival and HBV recurrence (defined by positive HBV DNA and hepatitis B surface antigen, HBsAg, in serum). Ultra-sensitive real-time PCR was used to detect HBV genomes using S-gene specific primers and fluorescent-labeled Taq-man based DNA probes (range 20 – > 107 IU/ml). A contemporary cohort of 60 HBV monoinfected LT recipients with median follow-up of 21.2 mo (0 – 42.0) served as controls for survival analysis. Results: 16 coinfected patients (all Caucasian males, median age 46 yrs, pre-LT CD4 count median 362/mm3 was considered about 2-4 kg, with a final gained BMI <30kg/m2. 7/14 donors didn’t complete the 3-mo dietician follow-up for donor unrelated reasons. In all 7/14 donors who successfully completed the 3-mo treatment (BMI <30), a liver biopsy was performed. In all 7 treated donors steatosis <30% was found, and they were considered eligible for donation. After LDLT, none of such donors experienced life-threatening complications or died. Liver function of both resected donors and transplanted graft showed a good outcome, with no differences (in term of hospital LOS, liver functional parameter normalization after resection, and liver regeneration) between them and other LDLT without hepatic steatosis. Treated fat donors showed no long-term clinical impairment, and all of them returned to previous activity after donation. In conclusion, donor livers with <30% steatosis are usable and anticipated to have good function. A short-term dietitian intensive regimen for fat donors seems to be effective in lowering hepatic steatosis by reaching such acceptable histological cutoff. This approach may provide a way for persons with steatosis to be successful liver donors and may be therefore useful to increase the organ pool without affecting the donor and recipient safety.

BACKGROUND: The outcome of liver transplantation (LT) in patients infected with Human Immunodeficiency Virus (HIV) has been a matter of controversy. Patients coinfected with HIV and hepatitis C virus (HCV) appeared in several small studies to have poorer outcome after LT compared to patients with HCV monoinfection. Methods: A retrospective cohort study was performed to assess the impact of HIV on LT survival by using UNOS Standard Transplant Analysis and Research (STAR) files. Results: A total of 138 HIV(+) and 30,520 HIV(-) patients who underwent LT were included in the analysis. Of 138 HIV(+) patients, 58 were HCV antibody positive (HCVAb)(+) and 21 hepatitis B surface antigen (HBsAg)(+). Among all HIV(+) patients, the estimated 2-year survival probability was lower (70%) than among non-HIV patients (81%). This excess risk appeared entirely among those with coinfections, e.g. HIV with HBV or HCV, as none of the 24 HIV infected patients who did not have HBV or HCV died during an average of 1.2 years of follow-up per person. HIV/HCV coinfected patients had significantly lower survival rate compared to non-HIV patients with HCV (p=0.006) and without HCV (p=0.003) after LT (Figure 1). In contrast to HCV/HIV coinfected patients, there was no significant difference in survival rates between HIV/HBV coinfected patients and HBV patients without HIV coinfection. Controlling for age, coinfection, MELD scores and other potential confounders in a Cox proportional hazards regression analysis, HIV(+) patients had a hazard ratio (HR) of 1.41 (P= 0.14, %95 CI: 0.90-2.22) for mortality post LT. Conclusion: Patients who had HIV/HCV coinfection had lower survival rates after LT compared to HCV patients without HIV coinfection. Such difference was not observed in HIV/HBV coinfected patients compared to HBV monoinfected patients undergoing LT.

IMPACT OF HIV ON SURVIVAL AFTER LIVER TRANSPLANTATION: ANALYSIS OF UNITED NETWORK FOR ORGAN SHARING (UNOS) DATABASE

Ayse L. Mindikoglu1, Arie Regev2, Laurence S. Magder1; 1Department of Medicine, Division of Gastroenterology and Hepatology, University of Maryland School of Medicine, Baltimore, MD; 2Global Product Safety, Eli-Lilly and Company, Indianapolis, IN.

Background: The outcome of liver transplantation (LT) in patients infected with Human Immunodeficiency Virus (HIV) has been a matter of controversy. Patients coinfected with HIV and hepatitis C virus (HCV) appeared in several small studies to have poorer outcome after LT compared to patients with HCV monoinfection. Methods: A retrospective cohort study was performed to assess the impact of HIV on LT survival by using UNOS Standard Transplant Analysis and Research (STAR) files. Results: A total of 138 HIV(+) and 30,520 HIV(-) patients who were ≥ 18 years old and underwent LT during the HAART era (starting from January 1, 1997) in the US were included in the analysis. Of 138 HIV(+) patients, 58 were HCV antibody positive (HCVAb)(+) and 21 hepatitis B surface antigen (HBsAg)(+). Twenty four HIV(+) patients were neither HCVAb(+) nor HBsAg(+). Among all HIV(+) patients, the estimated 2-year survival probability was lower (70%) than among non-HIV patients (81%). This excess risk appeared entirely among those with coinfections, e.g. HIV with HBV or HCV, as none of the 24 HIV infected patients who did not have HBV or HCV died during an average of 1.2 years of follow-up per person. HIV/HCV coinfected patients had significantly lower survival rate compared to non-HIV patients with HCV (p=0.006) and without HCV (p=0.003) after LT (Figure 1). In contrast to HCV/HIV coinfected patients, there was no significant difference in survival rates between HIV/HBV coinfected patients and HBV patients without HIV coinfection. Controlling for age, coinfection, MELD scores and other potential confounders in a Cox proportional hazards regression analysis, HIV(+) patients had a hazard ratio (HR) of 1.41 (P= 0.14, %95 CI: 0.90-2.22) for mortality post LT. Conclusion: Patients who had HIV/HCV coinfection had lower survival rates after LT compared to HCV patients without HIV coinfection. Such difference was not observed in HIV/HBV coinfected patients compared to HBV monoinfected patients undergoing LT.

LONG TIME FOLLOW UP FOR THE PATIENT OF AUTOLOGOUS BONE MARROW CELL INFUSION (ABMI) THERAPY FOR LIVER CIRRHOSIS

Shuji Terai, Makoto Segawa, Kaoru Omori, Takuya Iwamoto, Yuko Mizunaga, Toshihiko Matsumoto, Yohei Urata, Yoshio Marumoto, Tsuyoshi Ishikawa, Naoki Yamamoto, Koichi Uchida, Takahiro Yamazaki, Isao Sakaida; Department of Gastroenterology & Hepatology, Yamaguchi University Graduate School of Medicine, Ube, Yamaguchi, Japan

We previously reported the results of clinical study: Autologous bone marrow cell infusion (ABMI) therapy for liver cirrhosis patient. In the study, we reported 9 liver cirrhosis (LC) cases that underwent ABMI from the peripheral vein and followed up to 6 months. Subjects were LC patients with T.B. of <3.0 mg/dl, Plt of >50 (10^{10}/l) and no viable hepatocellular carcinoma on diagnostic imaging. Autologous bone marrow (BM: 400 ml) was isolated from the ilium under general anesthesia. Mononuclear cells (MNCs) were separated by cell washing and were infused via the peripheral vein. After ABMI therapy, liver function was monitored by blood examination for 6 months. Serum albumin and Child-Pugh Score were significantly improved at 1 month and 6 months (p<0.05) (Stem Cells 2006). Until now we did total 16 cases of ABMI therapy for LC patients. No major adverse effects were noted to do ABMI therapy. After clinical study, we could follow up 9 cases (Age: 61.6±5.0, HBV:3 cases, HCV:6 cases, Male: Female=8:1) up to 15 months after ABMI therapy. Serum albumin and total protein level was significantly improved at 6 months (p<0.05). In conclusion, ABMI therapy should be considered as a novel treatment for LC patients.

31 METRON FACTOR-1, AN HGF-MSP CHIMERA, PREVENTS LIVER INJURY WITHOUT PROMOTING TUMOR GROWTH AND METASTASIS

Terumi Takahara1, Feng Xue1,2, Yutaka Yata1, Kazunobu Nonome1, Masami Kanayama1, Kengo Kawai1, Toshiro Sugiyama1, Paolo Michieli2; 1Third Department of Internal Medicine, University of Toyama, Toyama City, Japan; 2Organ Transplantation Center, Renji Hospital Affiliated to Shanghai Jiao-tong University, Shanghai, China; 3Institute for Cancer Research and Treatment, University of Torino Medical School, Turin, Italy

BACKGROUND & AIMS: Hepatocyte Growth Factor (HGF) is the most powerful hepatotrophic factor identified so far. However, the ability of HGF to promote tumor cell ‘scattering’ and invasion raises some concern about its therapeutic safety. Recently, we engineered an HGF-MSP chimera named Metron Factor-1 (MF-1) that separates the favorable effects of HGF (prevention of apoptosis and tissue regeneration) from its adverse properties (invasion and metastasis; Michieli et al., Nature Biotechnol. 2002). We already reported that MF-1 stimulates hepatocyte proliferation and protects hepatocytes against apoptosis in vitro. In this study we compare the therapeutic efficacy of MF-1 with that of HGF in mouse models of acute and chronic liver injury. At the same time, we test the ability of MF-1 and HGF to promote tumor growth and metastasis in several mouse models of cancer. METHODS: MF-1 protein produced by lentiviral technology was purified by affinity chromatography. Acute liver injury was induced in mice by CCl4 injection. Chronic liver injury was induced by continuous CCl4 intoxication. Recombinant MF-1 or HGF was delivered using a micro-osmotic pump. For tumorigenesis analysis, MF-1 or HGF was delivered to human and mouse tumor cells by lentiviral technology, and cells were injected subcutaneously into CD-1 nu/nu mice. RESULTS: In acute liver injury, serum ALT levels were significantly suppressed by MF-1 or HGF treatment compared to the control group (MF-1, 5734 IU/L; HGF, 8430 IU/L; control, 17420 IU/L at 24 hours, p<0.001). TUNEL-positive apoptotic hepatocytes were significantly fewer in MF-1 (49.6%) or HGF (50.7%) treated mice relative to controls. Phospho-histone-3 positive hepatocytes were increased 4.5 times in MF-1- or HGF-treated mice. In the chronic injury model, hepatic fibrosis was prominent in control mice. In both MF-1- and HGF-treated mice, fibrotic area was significantly reduced. Hepatocyte proliferation index determined by Ki67 expression raised 2.1 times in both the MF-1 and HGF groups. In the subcutaneous tumor model, HGF significantly promoted xenograft growth of both A549 lung carcinoma cells (2.3 times, p<0.05) and MDA-MB-435 breast carcinoma cells (5.9 times, p<0.01). In contrast, tumors expressing MF-1 were slightly larger than control tumors (A549, 1.1 times; MDA-MB-435, 1.7 times). Analysis of lung metastasis revealed that HGF increased both metastasis incidence and number in both cell systems, while MF-1 had no effect. CONCLUSION: These data indicate that MF-1 is as effective as HGF at preventing liver injury and at promoting hepatocyte regeneration, but therapeutically safer than HGF as it lacks pro-metastatic activity.

32 DEGRADATION OF THE EGF RECEPTOR IN HEPATOCYTES IS MEDIATED BY A DYNAMIN-ASSOCIATED UBIQUITIN-BASED ENDOCYTIC MACHINERY

Barbara Schroeder1, Jing Chen1, Mark A. McNiven1,2; 1Division of Gastroenterology and Hepatology, Mayo Clinic, Rochester, MN; 2Biochemistry and Molecular Biology, Mayo Clinic, Rochester, MN

Internalization and degradation of receptor tyrosine kinases (RTKs) such as the EGFR is an essential process in hepatocytes that helps regulate growth factor concentrations in the serum as well as overall liver growth and size. This important process is mediated mainly by clathrin-coated vesicles (CCVs) and associated adaptor proteins that work together to internalize and target activated ubiquitinated EGFR to the lysosome for degradation. The large GTPase Dynamin 2 (Dyn2) is well known for its role in the sequestration of CCVs from the plasma membrane during receptor-mediated endocytosis (RME); however, it is unclear whether Dyn2 also participates in the sorting and degradation of the EGFR. Therefore, the GOAL of this study was to test for a potential interaction between Dyn2 and the ubiquitin-based endocytic machinery; define the molecular basis of this interaction; and test for a functional significance in EGFR sorting and degradation. Using GST-pulldown and immunoprecipitation assays, we detected a direct interaction between Dyn2 and CIN85 (cbl-interacting protein of 85 kDa), an adaptor protein that is ubiquitinated after EGFR stimulation and participates in EGFR degradation. CIN85 contains three SH3 domains, two of which can interact with the proline-rich domain of Dyn2. Interestingly, using two distinct assays employing either fluorescence microscopy or immunoprecipitation, we observed that the formation of this Dyn2-CIN85 complex is inducible and occurs 5-30 minutes following EGFR stimulation of hepatocytes (Clone 9, HuH7). To test for a functional role of the Dyn2-CIN85 interaction in EGFR trafficking in hepatocytes, we expressed a mutant CIN85 protein that cannot bind to Dyn2 and observed the fate of Rhodamine-labeled EGFR by fluorescence microscopy or the EGFR by Western blot analysis. Importantly, CIN85 mutant-expressing cells showed a marked increase in the time needed to degrade the EGFR. Further, these cells retained the labeled EGFR in a perinuclear Rab7-positive vesicular compartment for about 1 hour longer than control cells. Rab7 is known to associate with late endosomes, suggesting that cells expressing the CIN85 mutant are unable to traffic the receptor-ligand complex from late endosomes to lysosomes. In SUMMARY, these findings demonstrate a novel EGFR-induced association between the mechanoenzyme Dyn2 and the ubiquitin-based endocytic machinery. Further, this interaction appears to mediate the sorting and trafficking of EGFR in hepatocytes and, thus, is likely to have profound effects on the regulation of EGFR levels and subsequently cell growth.
33 PREVENTION AND TREATMENT OF ACUTE LIVER INJURY IN ANIMAL MODELS BY ENDOTHELIAL PROGENITOR CELLS

Verónica Fernández-Ruiz, Milosz P. Kawa, María Ilíiguez, Jesús Prieto, Cheng Qian; Hepatology and Gene Therapy, Center for Applied Medical Research-University of Navarra, Pamplona, Spain

Background and Aims: It has been demonstrated that the vascular endothelium plays an important role in tissue homeostasis and selective activation of VEGF receptor-1 reduced liver damage in animals exposed to a hepatotoxic compound via angiogenesis independent mechanism. Transplantation of endothelial progenitor cells (EPC) following acute liver injury induced by carbon tetrachloride improved survival of the mice, accompanied by increased hepatocellular proliferation. In order to explore therapeutic potency of EPC, we have established optimal protocols for prevention and therapy of acute liver damage induced concanavalin A (ConA) and adenovirus-mediated transfer of CD40 ligand (CD40L). Methods: Murine EPC were obtained by culturing mononuclear cells from bone marrow in endothelial growth factor enriched medium for 7 days. Two different models of acute liver failure were applied in C57BL/6 mice; intravenous administration of ConA at 12 mg/Kg (sub-lethal dose) and of adenovirus encoding CD40L (AdCD40L) at 10^10 pfu/mouse (lethal dose). The liver-damaged animals were treated by intravenous administration of 2x10^6 EPC either before (prevention) or after liver damage (therapy). The animal survival was observed and liver transaminases levels and histology were analyzed. Results: Our data showed intravenous administration of EPC at 24 hours before liver damage or intrasplenic administration (IS) at 1 hour before liver injury could significantly prevent increased serum level of transaminases in ConA model. The intravenous administration of EPC at 3 hours after liver damage could also significantly reduce serum level of transaminases, as compared with control animals without therapy. In model of CD40L, all animals died before 132 hours after intravenous injection of AdCD40L. Treatment of liver-damaged animals with a single dose of EPC by intravenous administration of EPC at 24, 48 and 72 hours after liver injury could induce 17%, 50% and 67% of animal survival, respectively. Treatment with two doses of EPC at 48 and 72 hours resulted in 100% of animal survival. Significant inhibition of increased transaminase was also observed in those animals after therapy with EPC. In our in vitro data we have shown that EPC produced VEGF and IGF-I at high level. Conclusion: Our data indicated that bone marrow derived-EPC exerted preventive and therapeutic activity in animals with acute liver damage. These effects may be due to that EPC produced hepatoprotective factors facilitating regenerative process of injured liver parenchyma.

34 DYNAMIC MICROTUBULES ARE REQUIRED FOR CONSTITUTIVE CANALICULAR TRAFFICKING OF BSEP (ABCB11) IN POLARIZED WIF-B9 CELLS AND PROVIDE THE "MISSING LINK" TO THE CANALICULAR ACTIN NETWORK

Yoshiyuki Wakabayashi, Jennifer Lippincott-Schwartz, Irwin M. Arias; CBMB, NICHD, NIH, Bethesda, MD

In WIF-B9 cells, endosomes containing the bile salt export pump (BSEP, ABCB11) traffic along microtubules (MTs) throughout the cytosol but only target the canalicular membrane from which they constitutively cycle to rab11a-positive endosomes (1, 2). In differentiated cells, including hepatocytes, there are at least two types of MTs: (a) dynamic MTs which are unstable (t 1/2 ~10 min), and (b) MTs which are stable for several hours. We investigated the role of dynamic MTs on BSEP trafficking and their linkage to the canalicular actin network. Using polarized WIF-B9 cells, we performed 3D reconstitution of MT distribution, and quantified live cell imaging of BSEP-YFP trafficking combined with fluorescence recovery after photobleaching. To visualize MT distribution, immunostaining was performed with alpha-tubulin and gamma-tubulin, a marker of the microtubular organizing center (MTOC). 3D reconstruction revealed that the MTOC is proximate to the bile canalculus which is surrounded by a MT web. EB1, a dynamic MT plus-end marker, also surrounded the canalculus. To determine the role of dynamic MTs in apical trafficking of BSEP, WIF-B9 cells were treated with 201F, a marine sponge product, which specifically disassembled dynamic MTs and not stable MTs. BSEP-YFP trafficking remained, presumably along stable MTs, and did not reach the canalicular membrane. In contrast, nocodazole disrupted all MTs, and all intracellular movement and canalicular trafficking of BSEP-YFP ceased. These studies reveal that apical BSEP trafficking requires dynamic MTs. To explore the relation between dynamic MTs plus-end and the actin network, we performed immunostaining of IQGAP, Rac, APC and EB1, which link dynamic MT plus-end and actin. These proteins all surrounded the bile canalicus in association with actin. Conclusion: Dynamic MTs are required for canalicular targeting of BSEP. Proteins known to link dynamic MTs to the actin network localize in the bile canalicular domain. Dynamic plus-end MTs may provide the long sought link between the MT and actin-based endosome trafficking systems which surround the bile canaliculus. 35 ENDOCYTIC INTERNALIZATION OF THE TRANSFERRIN RECEPTOR 1 (TFR1) IN HEPATOCYTES IS MEDIATED BY ACTIVATION OF SRC

Hong Cao1, Jing Chen1, Mark A. McNiven1,2; 1Division of Gastroenterology and Hepatology, Mayo Clinic, Rochester, MN; 2Biochemistry and Molecular Biology, Mayo Clinic, Rochester, MN

Hepatocytes internalize numerous receptors and trophic factors from the sinusoidal plasma membrane via a clathrin-mediated endocytic process. Ligand-induced activation of receptor tyrosine kinases such as the epidermal growth factor (EGF) receptor is thought to stimulate receptor internalization in part via activation of Src kinase family members. However, the uptake of other trophic ligand-receptor systems such as transferrin (Tf) has been assumed to be constitutive and unregulated. Therefore, the Goal of this study was to test whether ligand-induced
internalization of the transferrin receptor (TfR1) in hepatocytes is indeed via a Src-regulated, clathrin-based endocytic process. We observed that Src is activated (8-fold) in cultured cells upon addition of Tf, as assessed by Western blot analysis and immunofluorescence cell staining with a widely used antibody that recognizes activated Src. To test whether Tf uptake could be attenuated by direct inhibition of Src kinase we utilized several different approaches, including pharmacological inhibition of cells (PP2 and SU6656); expression of a dominant-negative Src mutant (Y419F/K297M); and the use of embryonic fibroblasts from Src-Yes-Fyn (SYF) knock-out mice. The drugs PP2 and SU6656 reduced uptake of Tf in cultured hepatocytes (Clone 9) by 60-70% as did expression of mutant Src. Further, Tf internalization was reduced by over 80% in SYF cells compared to control fibroblasts. Importantly, Tf uptake could be rescued to near normal levels in SYF cells that were transfected to express active Src (Y530F). Together, these results indicate that Src is activated by the TfR1. Next we asked whether Src is activating the endocytic machinery to support Tf internalization. Here, we tested whether the endocytic proteins dynamin 2 (Dyn2) and cortactin (Cort) were phosphorylated during Tf addition in 32P-labeled Clone 9 cells. We observed a marked increase (2.5-fold) in phosphorylation of both proteins that unexpectedly exceeded that exhibited by cells treated with either 10% FBS or 30 ng/ml EGF. Accordingly, expression of Dyn2 or Cort mutant proteins that could not be phosphorylated at key tyrosine residues (Dyn2 Y231F, Y597F; Cort Y384, 429, 445F) significantly attenuated Tf internalization in Clone 9 cells. In Conclusion, the observations described above provide the first evidence that internalization of the TfR1 in hepatocytes is potentiated by ligand-induced Src activation of the Dyn2 and Cort endocytic machinery rather than occurring through a constitutive endocytic mechanism as previously assumed. Supported by NIH R01 DK44650 to MAM.

EPIGENETIC GENE EXPRESSION PROFILING IDENTIFIED HGF ACTIVATOR INHIBITOR 2 (HAI-2) AS A FREQUENTLY SILENCED CANDIDATE TUMOR SUPPRESSOR GENE IN HUMAN HEPATOCELLULAR CARCINOMA
Edmund K. Tung, Chun M. Wong, Irene O. Ng; Pathology, The University of Hong Kong, Hong Kong, China

Epigenetic alteration is an important mechanism in the inactivation of tumor suppressor genes. We employed epigenetic profiling with pharmacological unmasking of DNA methylation to identify silenced candidate tumor suppressor genes in hepatocellular carcinoma (HCC). Following treatment with 5-aza-2’-deoxycytidine (5-aza-dC) in high-throughput cDNA microarray analysis, the expression of HGF activator inhibitor, HAI-2, was found to be significantly upregulated in two of three HCC cell lines (Hep3B, SMMC7721, and BEL7402). HAI-2 belongs to Kunitz-type serine protease inhibitor family and inhibit the generation of biologically active hepatocyte growth factor (HGF) through their interaction with HGF activator (HGFA). In this study, we validated the epigenetic silencing by DNA methylation of the HAI-2 gene and characterized its tumor suppressive function. Results: The mRNA expression of HAI-2 was absent or low in 12 HCC cell lines, but 5-Aza-dC treatment significantly upregulated HAI-2 expression in 9 of these cell lines in a dose- and time-dependent manner. The mRNA levels of HAI-2 were significantly underexpressed in ~80% of human HCCs. Using bisulfite DNA sequencing, we confirmed that the promoter of HAI-2 gene was frequently hypermethylated in HCC cell lines and human HCCs. In addition, using methylation-specific PCR, HAI-2 promoter methylation was detected in 71% of human HCCs, and HAI-2 promoter hypermethylation was associated with low mRNA expression levels. These results showed that HAI-2 was frequently hypermethylated and underexpressed in human HCCs. Ectopic expression of HAI-2 in SMMC cells significantly suppressed the growth of subcutaneous tumors in nude mice. In addition, HAI-2 significantly inhibited cell motility and cell invasion. To further elucidate the mechanisms of HAI-2's effects in HCC, we performed knockdown and overexpression experiments. Our results provided evidence that HAI-2 was capable of inhibiting cell growth and invasion, and that this effect was mediated through the inhibition of invasion. The findings of this study have important implications for the development of new therapeutic strategies for the treatment of HCC.
placebo group. Analysis conducted in patients without HCC at enrollment did not show any significant difference in 2- and 6-month survival between the 2 groups. In the subgroup of patients with severe acute alcoholic hepatitis (n=132), pentoxifylline did not affect mortality at 2 months (14% vs. 16%, p=0.77) or at 6 months (27% vs. 31%, p=0.30). In the subgroup of patients with renal dysfunction at enrollment (n=39), pentoxifylline did not affect mortality at 2 months (35% vs. 31%, p=0.82) or at 6 months (52% vs. 62%, p=0.52). There was no significant difference between pentoxifylline and placebo group in the incidence of adverse events. In multivariate analysis, factors significantly associated with mortality were older age, greater MELD score and the presence of early HCC. In conclusion, treatment with pentoxifylline does not improve short-term survival in patients with advanced cirrhosis, even in the subgroup of patients with severe acute alcoholic hepatitis or with renal dysfunction.

**GLOMERULAR FILTRATION RATE AS AN IMPROVED PROGNOSTIC INDICATOR IN PATIENTS WITH END STAGE LIVER DISEASE**

Young Suk Lim, Joanne T. Benson, Walter Kremers, Patrick S. Kamath, Terry M. Therneau, W. Ray Kim; Mayo Clinic College of Medicine, Rochester, MN

**Background:** Renal function is an important prognostic indicator in patients with end stage liver disease (ESLD). One of the advantages of MELD is its inclusion of serum creatinine, although its accuracy as a measure of renal function may be suboptimal. Recently, serum sodium (Na), which also reflects renal function in patients with ESLD, has been shown to improve MELD. **Aim:** We evaluated the degree to which directly measured renal function (glomerular filtration rate, GFR) adds to MELD. **Methods:** Adult (age>18 years) patients with ESLD underwent GFR measurement at the time of initial evaluation for liver transplantation. GFR was measured by standard non-radioabeled iothalamate clearance. Proportional hazards regression analysis was performed to evaluate GFR in addition to MELD variables in predicting survival. **Results:** We collected data on 861 Mayo Clinic patients listed for primary liver transplantation from 1990 through 1999. Of 650 patients with complete data, 35 died without receiving LTx. The mean MELD at baseline was 15.6 (standard deviation [SD]: 7.1). The mean GFR was 77.9 mL/min/1.73m2 (SD:31.8). The mean creatinine was 1.14 mg/dl (SD: 0.86). There was significant, yet modest correlation serum creatinine and GFR (R=-0.57, p<0.01). The table summarizes Cox models incorporating MELD variables, Na and GFR. Model 1 includes only MELD, whereas Models 2 and 3 incorporate GFR in addition to MELD variables. Adding GFR clearly improves the accuracy of MELD. In Model 3, coefficients were refit for the MELD variables and Na. Once GFR is included, serum creatinine and Na were no longer significant. The final model consisting of total bilirubin [HR=2.31, p<0.01], INR [HR=3.14, p<0.01] and GFR [HR=0.26, p<0.01] remained superior to other models (Chi-square=53.0). **Conclusions:** Directly measured GFR is superior to serum creatinine in assessing mortality risk in patients with ESLD awaiting liver transplantation. These data suggest that incorporating measures of renal function that are more accurate than serum creatinine may improve the accuracy of MELD.

**ENDOSCOPIC VARICEAL LIGATION (EVL) PLUS PROPRANOLOL (P) AND ISOSORBIDE MONONITRATE (ISMN) VERSUS EVL ALONE IN SECONDARY PROPHYLAXIS OF VARICEAL BLEEDING: A PROSPECTIVE RCT**

Sanjeev K. Jha, Ashish Kumar, Barjesh C. Sharma, Shiv Kumar Sarin; Gastroenterology, G B Pant Hospital, New Delhi, India

**Background:** Both EVL and propranolol are valuable methods for secondary prophylaxis of variceal bleeding. Addition of ISMN to propranolol enhances reduction of the hepatic venous pressure gradient (HVPG) and improves the efficacy of drug therapy. It is hypothesized that a combination of EVL with the two portal pressure reducing drugs should significantly be better than EVL alone. Patients and Methods: Patients with history of variceal bleed were randomized into either EVL alone (Group A) or EVL plus propranolol and ISMN (Gr. B) HVPG was measured at baseline in everyone. EVL was repeated every 2 wk until varices were eradicated. Propranolol dose was adjusted to reduce the resting heart rate <55 bpm. Dose of ISMN was 40 mg/d. Primary end points were rebleeding or death. Secondary end-points were complications of cirrhosis (encephalopathy, hepatorenal syndrome, spontaneous bacterial peritonitis, and jaundice) Results: A total 171 patients were randomized into EVL alone (Gr. A, n=92) and EVL plus propranolol and ISMN (Gr. B, n=79). Demographic, clinical, and biochemical profiles were comparable. Mean follow-up was 16±8 mo. Primary end points were achieved in 19 patients (21%) in group A and 20 (25.3%) in group B (p=0.46). The bleeding rates were 21.7% in Gr. A and 24% in Gr. B patients (p=0.71). Five patients (5.4%) of group A and 9 (11.3%) of group B died (P=0.17). Twenty four patients (26.1%) of group A and 23 (29.1%) of group B achieved secondary end-points. Five (36%) (Group A, 1; Group B, 4) died as a result of rebleeding. HVPG [19.3±5.7 vs 15.9± 4.8mmHg (P<0.001)] Child score [9.5±2.15 vs. 7.9± 2.07 (P<0.001)], MELD score 17.1±6.9 vs 13.1± 5.4(P<0.001), S. bilirubin [3.2±3.4mg/dl vs 1.9±2.7(P=0.003) and prothrombin time [25±10 vs20±6second (P<0.001)] were higher in patients who reached the primary end points. However, on multivariate analysis only HVPG and PT were found to be independently significant. **Abbreviations:**

GFR: glomerular filtration rate

INR: international normalization ratio

Na: serum sodium concentration
associated with primary end-points. Baseline and follow-up HVPG (n=33) after 12 months were 15.8±5.6 and 16.1±4.0 (p=0.78) respectively. Conclusions: Addition of propranolol and ISMN to EVL does not further reduce the incidence of variceal rebleeding as achieved by EVL therapy given alone. There is little benefit of identifying non-responders by doing serial HVPG measurements as Child’s and MELD scores also significantly influence the probability of variceal rebleeding.

Serra3, Carlos Muñoz1, Miguel Pérez-Mateo1, Jose Such1,6,1 Liver Unit, Hospital General Universitario, Alicante, Spain; 2Sección de Hepatología, Hospital de la Santa Creu i Sant Pau, Barcelona, Spain; 3Sección de Hepatología, Hospital Germans Trias i Pujol, Badalona, Spain; 4Sección de Hepatología, Hospital del Mar, Barcelona, Spain; 5Servicio de Hepatología, Hospital Clínico Universitario, Valencia, Spain; 6CIBERehd, Instituto de Salud Carlos III, Madrid, Spain.

Introduction: We have previously reported that roughly 40% of patients with cirrhosis and non-infected ascitic fluid (AF) show the presence of bacterial DNA (bactDNA) in blood and AF. In this work, we tested the hypothesis that the presence of bactDNA in AF and serum is associated to decreased survival in patients with cirrhosis and non-infected ascites. Material and Methods: In a prospective, multicenter study, we analyzed the clinical evolution of 156 patients with cirrhosis and sterile AF according to the presence or absence of bactDNA fragments in both AF and serum at admission. BactDNA was detected by polymerase-chain reaction-based method and species identified by an automated nucleotide sequencing process. Survival was determined during a follow-up of 12 months and analyzed using the Kaplan-Meier life-table and Log-rank test. Data were censored at 365 days or liver transplantation or TIPS procedures. Results: Age of patients was 61±12 years and 67% were male. The aetiology of cirrhosis was alcoholic in 64% and chronic infection by hepatitis C virus in 35% patients. Sixty percent were Child-Pugh B and 39% were Child-Pugh C, and 43% of patients were included in the study during their first episode of ascitic decompensation. Serum/ascitic bactDNA was detected in 48 patients (bactDNA(+)). The most prevalent bacteria identified was E. Coli (72%). Mean age was significantly higher in bactDNA(+) than bactDNA(-) patients (64±12 vs 60±11 years respectively; p=0.03). No other statistical significant differences between groups were found. Eighteen out of 48 bactDNA(+) patients (38%) died during the 12 months of follow-up compared with 15 out of 108 bactDNA(-) patients (14%; p=0.001). Eight out of 17 patients (47%) with previous episodes of encephalopathy died compared with 25 patients in the group without antecedents of encephalopathy (18% p=0.006). In a Cox proportional hazards multiple regression including bactDNA status, age and previous encephalopathy, the only significant relationship was established between bactDNA status and death (hazard ratio of death: 2.2, 95%CI: 1.1-4.6, p=0.03). Spontaneous bacterial peritonitis developed in 1 bactDNA(+) (2%) and in bactDNA(-) patients (8%; p=0.18) during the year of follow-up. Conclusions: The presence of bactDNA in serum/AF in a patient with cirrhosis and sterile AF during an ascitic decompensation episode is an indicator of poor prognosis, and does not predispose patients to the development of spontaneous bacterial peritonitis episodes.

41 A MULTI-CENTER CASE-CONTROL STUDY OF GENETIC PREDICTORS FOR HEPATOPULMONARY SYNDROME (HPS)

Michael B. Fallon1, Kari Roberts2, Michael J. Krowka3, Vijay Shah2, James F. Trotter4, David Badesch5, Lisa Forman6, Robert S. Brown5, Dan Rabinowitz2, Steven Zacks6, Steven M. Kawut2.

1Medicine, University of Alabama at Birmingham, Birmingham, AL; 2Medicine, Tufts-NEMC, Boston, MA; 3Medicine, Mayo Clinic, Rochester, MN; 4Medicine, University of Colorado, Denver, CO; 5Medicine, Columbia University, New York, NY; 6Medicine, University of North Carolina, Chapel Hill, NC.

Introduction: The hepatopulmonary syndrome (HPS) occurs in 10-30% of patients with cirrhosis and adversely affects survival with or without liver transplantation (OLT) outcomes. There are no established predictors of HPS. We aimed to determine whether genetic variation was associated with the risk of HPS in patients being evaluated for OLT. Methods: We performed a case-control study at six US academic medical centers between 2004-2006. HPS was defined as an abnormal alveo-arterial oxygen gradient and intrapulmonary vascular shunting on contrast enhanced transthoracic echocardiography (CE) in the absence of intrinsic restrictive or obstructive lung disease. Controls included those with negative CEs or with positive CEs and normal alveolar-arterial oxygen gradients and no lung disease. We performed a genetic analysis association study using >1000 single nucleotide polymorphisms (SNPs) in 94 candidate genes per subject. Results: 53 patients with HPS were compared to 139 controls. HPS and controls had similar ages (53 ± 10 vs 52 ± 10), sex (53% vs 66% male) and MELD scores (13.8 ± 3.8 vs 12.8 ± 5.6) respectively. HPS patients had significantly higher median [IQR] alveolar-arterial oxygen gradients (22 [19-33] vs 8.5 [3-13], p < 0.0001) and lower PaO2 (76±12 mmHg vs 93±12 mmHg, p<0.0001) values. Using an additive genetic model, SNPs in endothostatin (COL18A1, angiogenesis inhibitor), Elastin (ELN, elastic extracellular matrix fiber) and Von Willebrand factor (VWF, endothelial derived coagulation and inflammatory mediator)were associated with an increased risk of HPS (p<0.005). SNPs in Tie-1 (vascular-specific receptor tyrosine kinase involved in angiogenesis) and caveolin3 (CAV3, muscle specific caveolin isoform) were also associated with an increased risk of HPS. (p<0.006). All of the SNPs associated with HPS were in Hardy-Weinberg equilibrium (p>0.05). Conclusions: Genetic variation in several systems, including those involved in endothelial cell signaling, angiogenesis, and activation as well as vascular matrix production and smooth muscle development are associated with an increased risk of HPS in cirrhosis. Future studies will examine these pathways in mechanisms of HPS.

42 ELTROMBOPAG RAISES PLATELET COUNTS IN TWO WEEKS IN PATIENTS WITH HCV AND SIGNIFICANT THROMBOCYTOPENIA

Nezam H. Afdhal\(^1\), John G. McHutchison\(^2\), Mitchell L. Shiffman\(^3\), Mariel Rodriguez-Torres\(^4\), Geoffrey M. Dusheiko\(^5\), Samuel Sigal\(^6\), Scott White\(^7\), Nicole Blackman\(^8\), Dickens Theodore\(^9\); \(^1\)Beth Israel Deaconess Medical Center, Boston, MA; \(^2\)Duke Clinical Research Institute, Durham, NC; \(^3\)Virginia Commonwealth University Health System, Richmond, VA; \(^4\)Fundacion de Investigacion de Diego, San Juan, PR; \(^5\)Royal Free Hospital, London, United Kingdom; \(^6\)Weill Medical College of Cornell University, New York, NY; \(^7\)GlaxoSmithKline, Collegeville, PA; \(^8\)GlaxoSmithKline, Greenford, United Kingdom; \(^9\)GlaxoSmithKline, Research Triangle Park, NC

**Background**

Thrombocytopenia is observed in patients with advanced hepatic fibrosis and cirrhosis and is considered a surrogate marker for the severity of fibrosis. These patients require medical care that often includes invasive medical procedures, such as liver biopsy, dental extractions, gastrointestinal endoscopy with biopsy or coronary angiography. For patients with severe thrombocytopenia (<50,000/µL), platelet transfusions are often used to manage the bleeding risk associated with such invasive procedures.\(^1,2\) Eltrombopag is an oral non-peptide thrombopoietin receptor agonist which has been shown to increase platelet counts in healthy volunteers and subjects with idiopathic thrombocytopenic purpura. **Methods**

In a double-blind, randomized, multi-center clinical trial, 74 subjects with advanced hepatic fibrosis and cirrhosis due to chronic hepatitis C virus (HCV) with baseline platelet counts between 20,000-70,000/µL received placebo or eltrombopag tablets 30, 50 or 75 mg once daily for 4 weeks. The primary endpoint was increase in platelet count to ≥100,000/µL within 4 weeks. Patients could then initiate pegylated interferon and ribavirin combination therapy and continue eltrombopag or placebo for an additional 12 weeks. Data from a subgroup analysis of 26 patients with baseline platelet count <50,000/µL are reported here.

**Results**

After 2 weeks of treatment with eltrombopag, 20%, 71% and 63% of patients in the 30, 50, and 75 mg groups, respectively, achieved platelet count ≥100,000/µL. No patient on placebo achieved platelet count of ≥100,000/µL. The mean platelet count after 2 weeks of treatment was 74,000/µL, 129,000/µL, and 146,000/µL for the 30, 50 and 75 mg groups, respectively. The mean platelet count after 3 weeks of eltrombopag was 112,000/µL, 193,000/µL, and 192,000/µL for the 30, 50, and 75 mg groups, respectively. At 3 weeks, no patient had platelet count >400,000/µL.

**Conclusions**

Within 2 weeks, eltrombopag increased platelet counts in this patient population with advanced liver disease to levels that could reduce the need for platelet transfusion. Confirmation of these data and evaluation of the effect of increased platelet counts on platelet transfusion rate in a larger patient population is warranted.

43 ANALYSIS OF HEPATOCYTE-SPECIFIC CASPASE-8 KNOCKOUT MICE IN EXPERIMENTAL MODELS OF LIVER INJURY

Christian Liedke\(^1\), Julia Freimuth\(^1\), Konrad L. Streeetz\(^1\), Naiara Beraza\(^1\), Daniela Lambertz\(^1\), Dieter Riethmacher\(^1\), Christian Trautwein\(^1\); \(^1\)Department of Medicine III, University Hospital Aachen, Aachen, Germany; \(^2\)Centre for Molecular Neurobiology, Hamburg, Germany

The pro-apoptotic factor caspase-8 is the most upstream-located protease (caspase) involved in apoptosis mediated by Fas, TNF and related death receptors of the TNF superfamily. Induction of apoptosis in the liver is related to liver injury potentially resulting in liver failure. The aim of this study was to investigate the effect of caspase-8 depletion in different models of experimental liver injury. To investigate the molecular function of caspase-8, conditional hepatocyte-specific knockout (KO) mice were generated by flanking exons 3-4 with loxP sites and introducing a cre-recombinase transgene under the control of the hepatocyte-specific albumin promoter. Deletion of exons 3 and 4 introduced a frame shift mutation within the caspase-8 mRNA resulting in a premature stop of protein translation after 107 amino acids. The efficiency of the caspase-8 knockout was analysed in primary hepatocytes on DNA, RNA and protein levels revealing a deletion efficiency of >90%. To study the role of caspase-8 for Fas-mediated liver injury, KO mice and control animals (WT) were treated with a Fas-activating antibody (JO2). WT mice showed highly enhanced transaminases beginning 5 hours after treatment and a mortality of 80% within 24 hours due to massive apoptosis and liver failure as shown by TUNEL analysis and liver histology. In contrast, 100% of caspase-8 KO mice survived JO2 treatment and displayed normal transaminase levels and liver histology. Next, we investigated caspase-8 KO mice and controls in the lipopolysaccharide/galactosamine (LPS/GalN) model of TNF-dependent hepatotoxicity. WT mice showed increased serum transaminases beginning 6 hours after LPS/GalN treatment which was correlated with enhanced caspase-3 activity, strong liver apoptosis and 30% mortality within 24 hours whereas all KO mice survived the treatment without any signs of liver damage. Finally, we applied the Concanavalin A (ConA) model of liver injury on caspase-8 KO mice and controls. ConA-mediated liver injury is also TNF dependent and involves massive
recruitment of activated T cells to the liver. Unexpectedly, caspase-8 KO mice were not protected from ConA-induced liver injury. On the contrary, KO mice showed enhanced serum transaminase levels and decreased survival (85% compared to 100% in WT animals) following ConA treatment. In conclusion, our data shows that inactivation of caspase-8 in hepatocytes protects from Fas- and LPS-mediated liver injury but not from ConA-induced hepatotoxicity implicating that caspase-8 dependent apoptosis is not a major signaling pathway during T-cell induced hepatitis.

44 APOPTOSIS-INDUCING FACTOR CAUSES MITCHONDRIAL OXIDANT STRESS AND NUCLEAR DNA FRAGMENTATION IN ACETAMINOPHEN-INDUCED LIVER INJURY

Hartmut W. Jaeschke1, Margitta Lebofsky1, John J. Lemasters2, Mary Lynn Bajt1; 1Pharmacology, Toxicology & Therapeutics, University of Kansas Medical Center, Kansas City, KS; 2Pharmaceutical Sciences, Medical University of South Carolina, Charleston, SC

Acetaminophen (APAP) overdose causes centrilobular necrosis in human and mouse livers. DNA fragmentation is a hallmark of APAP-induced cell death. Recent evidence showed the nuclear translocation of apoptosis-inducing factor (AIF), which correlated with DNA fragmentation, after APAP overdose in mice (Bajt et al., Tox Sci 94: 217-225, 2006). When released from mitochondria, AIF combines with cyclophilin A and forms an active DNase. On the other hand, mitochondrial AIF is critical for oxidative phosphorylation and can function as superoxide-generating NADH oxidase. To address the hypothesis that AIF may be a critical mediator in APAP-induced cell death, fasted male AIF-deficient mice (Hq) and respective wildtype animals were treated with 200 mg/kg APAP. Liver injury (plasma alanine aminotransferase (ALT) activity, necrosis by histology) and nuclear DNA damage (TUNEL assay and anti-histone ELISA) were evaluated at 6 h after APAP. In wildtype animals, APAP induced severe liver injury as indicated by the increase of plasma ALT activities (8600 ± 1870 U/L) and 61 ± 8% necrosis. This injury was accompanied by massive DNA strand-breaks in centrilobular hepatocytes (TUNEL assay) and release of DNA fragments into the cytosol (anti-histone ELISA). In contrast, Hq mice had significantly less liver injury (ALT: 330 ± 130 U/L; necrosis: 4 ± 2%) and minimal nuclear DNA damage at 6 h. Both wildtype and Hq mice had the same baseline levels of glutathione (GSH) and glutathione disulfide (GSSG), showed the same (75%) depletion of hepatic GSH 20 min after APAP and had a similar recovery of liver GSH levels at 6 h. This suggests that there was no relevant difference in metabolic activation of APAP. However, hepatic levels of GSSG and immunohistochemical staining for nitrotyrosine protein adducts, which reflect a mitochondrial oxidant stress and peroxynitrite formation, resp., were only increased in APAP-treated wildtype animals and remained near baseline in Hq mice. These data indicate an absence of APAP-induced mitochondrial oxidant stress in Hq mice. Conclusion: Our data suggest that AIF has a critical dual function in APAP hepatotoxicity. AIF is important for the generation of reactive oxygen in mitochondria (NADH oxidase function) and, upon release from mitochondria, is involved in DNA fragmentation (DNase function). Supported by NIH grant DK070195.

45 ETHANOL SUPPRESSES MHC CLASS I-RESTRICTED ANTIGEN PRESENTATION IN LIVER CELLS: ROLE OF PROTEASOME

Natalia A. Osna1,2, Kusum K. Kharbanda1,2, Ronda L. White1,2, Geoffrey M. Thie1,2, Terrence M. Donohue1,2; 1Internal Medicine, University of Nebraska Medical Center, Omaha, NE; 2VA Medical Center, Omaha, NE

Background: To clear hepatitis B or C viruses, infected hepatocytes are targeted by cytotoxic T lymphocytes (CTLs), which recognize viral peptide-MHC class I complexes. The proteasome is the major enzyme that cleaves viral proteins to peptides for antigen presentation. Proteasome function is compromised by ethanol metabolism. Heavy alcohol consumption contributes to disease progression, possibly by impaired recognition of infected hepatocytes by CTLs. The aim of this study was to investigate the effect of ethanol on processing and presentation of the ovalbumin peptide, SIINFEKL, a CTL epitope generated by the proteasome and presented in the H2Kb context. Methods: HepB5 cells, a H2Kb+ hepatocyte-derived cell line, which possess low alcohol dehydrogenase (ADH) and high cytochrome P450E1 (CYP2E1) activities. H2Kb-expression was induced by IFNγ treatment. Cells were exposed to 50 mM ethanol for 48 hr and then C-extended peptide, SIINFEKL-TE was delivered to the cells via the Chariot® reagent. Cleaved SIINFEKL peptide-H2Kb complex were quantified on the cell surface by flow cytometry. Results: SIINFEKL-H2Kb surface expression, following extended peptide delivery to the cell was blocked by the ER trafficking inhibitor, brefeldin A. Prior exposure to ethanol caused a 35% reduction of SIINFEKL-H2Kb presentation, which was partially reversed by treatment with 4-methylpyrazole. The proteasome inhibitor, MG132 also reduced SIINFEKL presentation. Ethanol-elicted reduction in presentation can be attributed to impaired IFNγ signaling, which regulates antigen presentation machinery and stimulates H2Kb expression and/or to impaired generation of SIINFEKL from SIINFEKL-TE by the proteasome. In fact, induction of immunoproteasome subunits and PA28, but not H2Kb expression by IFNγ was partially suppressed by ethanol exposure. However, we observed no changes in IFNγ-induced STAT1 phosphorylation. In addition, proteasome activity was suppressed by 25-40% by ethanol treatment, which caused stabilization of uncleaved SIINFEKL-TE peptide detected by HPLC. Suppressive effects of ethanol on proteasome function were mimicked by the SAH hydrolase inhibitor, tubericidin, indicating that ethanol-impaired methylation may be partially responsible for the reduced proteasome activity. We conclude that ethanol metabolism impairs MHC class I-restricted antigen presentation on hepatocytes by interfering with IFNγ signaling and by blocking proteasome activity, thereby preventing subsequent peptide cleavage.

46 ACUTE ETHANOL CAUSES LIVER MITOCHONDRIAL DEPOLARIZATION IN VIVO INDEPENDENT OF THE MITOCHONDRIAL PERMEABILITY TRANSITION (MPT) AND POTASSIUM CHANNEL OPENING

Zhi Zhong1, Venkat K. Ramshesh1, Hasibur Rehman1, John J. Lemasters1,2; 1Pharmaceutical Sciences, Medical University of South Carolina, Charleston, SC; 2Biochemistry & Molecular Biology, Medical University of South Carolina, Charleston, SC

BACKGROUND: Acute ethanol treatment increases oxygen uptake and decreases ATP production in isolated-perfused
rodent livers, suggesting an alteration of mitochondrial function. It is unclear, however, if ethanol causes mitochondrial dysfunction in vivo. Accordingly, the aim of this study was to investigate changes of mitochondrial polarization and permeability in vivo after acute alcohol treatment. **Methods:** Mice were gavaged with one inebriating dose of ethanol (6 g/kg). Mitochondrial polarization, cell death and mitochondrial inner membrane permeability were assessed by intravital multiphoton microscopy of rhodamine 123 (Rh123), propidium iodide (PI) and calcine, respectively, at 1-24 h after ethanol treatment. **Results:** In livers of saline-treated mice, hepatocytes exhibited punctate green Rh123 fluorescence. By contrast after ethanol treatment, mitochondria of many hepatocytes did not take up Rh123, indicating mitochondrial depolarization. Mitochondrial depolarization occurred in 16%, 55% and 94% of hepatocytes at 1, 4 and 6 h after ethanol treatment, respectively, and remained >85% at 12 h, which indicated widespread, severe mitochondrial dysfunction. Subsequently, mitochondria repolarized such that only 16% of hepatocytes contained depolarized mitochondria 24 h after treatment. Virtually all hepatocytes not taking up Rh123 excluded PI at 1-24 h, indicating that loss of cell viability was minimal after acute ethanol treatment. Calcine, a 623 Da fluorophore that loads into the cytosol and can gain entrance to the mitochondrial matrix space when MPT pores open, outlined mitochondria as dark voids in the hepatocytes of saline-treated mice. Importantly, these voids remained 6 h following ethanol treatment despite mitochondrial depolarization in >90% of hepatocytes. Moreover, nim811 (20 mg/kg, i.g. or i.p.), a non-immunosuppressive cyclosporin A derivative that inhibits the MPT, did not prevent mitochondrial depolarization after acute ethanol. These findings suggest that acute ethanol-induced mitochondrial depolarization in vivo was not due to onset of the MPT. \( K_{ATP} \) channel blockers glybenclamide (5-20 mg/kg, i.p.) and 5-hydroxydecanoic acid (10-100 mg/kg, i.p.) also did not prevent mitochondrial depolarization caused by ethanol. **Conclusion:** Acute ethanol causes widespread, reversible mitochondrial depolarization in the liver. This mitochondrial depolarization is not due to onset of the MPT or opening of potassium channels in the mitochondria. Ethanol-induced mitochondrial dysfunction may contribute to steatosis after acute and hepatotoxicity after chronic ethanol exposure (NIDDK).

**47 BILE ACIDS REGULATE HEPATOCYTE CELL DEATH BY DIFFERENTIAL ACTIVATION OF CLASS 1A PHOSPHATIDYL-INOSITIDE-3-KINASE P110 ISOFORMS**

Simon Hohenester, Ulrich Beuers, Sawkat Anwer, Cynthia R. Webster

**Background:** The mechanism by which acute ethanol toxicity impairs liver regeneration is incompletely understood. We have previously shown that Fibroblast Growth Factor 10 (FGF10), expressed by embryonic hepatic stellate cells binds to the receptor FGFR2b expressed by hepatoblasts to promote cell proliferation during hepatogenesis (Berg et al., Hepatology 46: 2007). Also we have shown that expression of Fgf10 is upregulated over twenty-fold after partial hepatectomy (PH) and that expression of the dominant negative form of the soluble FGFR2b leads to impaired liver regeneration. We hypothesize that impaired liver regeneration in the setting of acute ethanol toxicity is in part due to impaired expression of Fgf10 and that upregulation of Fgf10 may rescue such impairment. **Methods:** We have generated triple transgenic mice (CMV-Cre; rtTAflox; tet(O)Fgf10) allowing for doxycycline induced ubiquitination of PI3K-p110 isoforms by GCDC, TLC and TUDC and the effect of PI3K-p110 gamma inhibition on GCDC-induced apoptosis was determined. Methods: Cultured rat hepatocytes were treated with 50 nM GCDC or TUDC or 25 μM TLC for 15 min. After selective immunoprecipitation, Class IA PI3K-p110 isoform specific activity was determined in a lipase kinase assay by monitoring the production of phosphatidylinositol -3,4,5 triphosphate from phosphatidylinositol -4,5 biphosphate by thin layer chromatography. Akt (S473) phosphorylation as a readout of PI3K activity was determined by immunoblot of whole cell lysates. Hepatocyte apoptosis was determined 2 hrs after treatment with 50 μM GCDC in the presence or absence of a selective PI3K gamma inhibitor (Camps M. et al Nat Med 11, 936 2005) by fluorescent microscopy of Hoechest 33258 stained cells. Bile acid uptake was determined by measuring accumulation of [3H] taurocholate after 30 min. All experiments were done 4-6 times and p <0.05 was considered significant. Results: GCDC, TLC and TUDC induced a 2.6 +/- 0.77, 4.1 +/- 0.39- and 3.0 +/- 0.61 -fold phosphorylation of Akt after 30 min, respectively. All 3 bile acids activated the p110 beta isoform 1.5 to 1.6 fold. The p110 alpha isoform was activated 1.5 +/- 0.73 and 1.6 +/- 0.68 fold by TUDC and GCDC, respectively. Both hepatotoxic bile acids, GCDC and TLC, but not TUDC, activated the p110 gamma isoform by 2.0 +/- 0.28 and 1.4 +/- 0.33 fold, respectively. A pro-apoptotic effect of p110 gamma activation was supported by the following results; a) pretreatment (30 min) with 2.5 μM of a selective PI3K gamma inhibitor (Calbiochem S28108) significantly attenuated GCDC induced Akt phosphorylation by 50 +/-15 %, but had no effect on TUDC induced Akt phosphorylation and 2) GCDC induced hepatocyte apoptosis was significantly decreased (60 +/- 19%) in the presence of the PI3K gamma inhibitor. The PI3K gamma inhibitor had no effect on bile acid accumulation. Conclusion: Bile acid-induced activation of PI3K-p110 is isoform-specific. Activation of PI3K-p110 gamma promotes cell death, but is not involved in the activation of Akt by TUDC.

**48 INDUCED OVEREXPRESSION OF FIBROBLAST GROWTH FACTOR 10 PARTIALLY RESCUES ACUTE ETHANOL TOXICITY IMPAIRMENT OF LIVER REGENERATION**

Joaquín J. Estrada, Tove A. Berg, Lily Lee, Travis Chong, Shigang Xiong, Pierre Del Moral, Saverio Bellussi, Hidekazu Tsukamoto, Kasper Wang; Pediatric Surgery, Childrens Hospital Los Angeles, Los Angeles, CA; Department of Pathology, Keck School of Medicine, University of Southern California, Los Angeles, CA

**Background:** The mechanism by which acute ethanol toxicity impairs liver regeneration is incompletely understood. We have previously shown that Fibroblast Growth Factor 10 (FGF10), expressed by embryonic hepatic stellate cells binds to the receptor FGFR2b expressed by hepatoblasts to promote cell proliferation during hepatogenesis (Berg et al, Hepatology 46: 2007). Also, we have shown that expression of Fgf10 is upregulated over twenty-fold after partial hepatectomy (PH) and that expression of the dominant negative form of the soluble FGFR2b leads to impaired liver regeneration. We hypothesize that impaired liver regeneration in the setting of acute ethanol toxicity is in part due to impaired expression of Fgf10 and that upregulation of Fgf10 may rescue such impairment. **Methods:** We have generated triple transgenic mice (CMV-Cre; rtTAflox; tet(O)Fgf10) allowing for doxycycline induced ubiquitination of PI3K-p110 isoforms by GCDC, TLC and TUDC and the effect of PI3K-p110 gamma inhibition on GCDC-induced apoptosis was determined. tous expression of Fgf10. Triple transgenic mice are considered as experimental while double transgenic (CMV-Cre; rtTAflex) mice are considered as controls. Two-thirds PH were performed in 12-week old wildtype and transgenic mice. Transgenic mice were treated with doxycycline for 48 hours prior to PH. Double and triple transgenic mice were treated with doxycycline alone or with doxycycline and 35% ethanol (3g/kg dose) via orogastric gavage 30 minutes prior to PH and 11 hours after PH. Relative levels of Fgf10 were analyzed by real time PCR at 0 hours and 24 hours after 2/3 PH. Regenerative capacity of the liver was assessed via proliferation (PCNA immunofluorescence staining). Results: Wildtype mice undergoing PH exhibited a 20-fold increase in Fgf10 expression whereas mice treated with EIOH gavage and PH manifested a 43% reduction in Fgf10 expression. Expression of Fgf10 was upregulated over 1000-fold and 600-fold in the experimental mice compared to control mice before and after PH, respectively. This resulted in a three-fold increase in hepatic proliferation prior to PH compared to control. Twenty-four hours after PH, the experimental mice exhibited a six-fold increase in PCNA staining compared to control. Finally, the experimental mice undergoing PH and treated with EIOH exhibited a greater than four-fold increase in hepatic PCNA staining compared to the control mice indicating that impaired liver regeneration can be partially rescued with overexpression of Fgf10. Conclusion: Impaired liver regeneration caused by ethanol ingestion is due in part to the abrogation of Fgf10 upregulation after PH. Induced overexpression of Fgf10 expression partially rescues liver regeneration impaired by acute ethanol toxicity.

ANTIVIRAL, PHARMACOKINETIC AND SAFETY DATA FOR GS-9190, A NON-NUCLEOSIDE HCV NS5B POLYMERASE INHIBITOR, IN A PHASE-1 TRIAL IN HCV GENOTYPE 1 INFECTED SUBJECTS

Linda Bavisotto1, Chia C. Wang2, Ira M. Jacobson3, Patrick Marcellin4, Stefan Zeuzem5, Eric J. Lawitz6, Martin Lunde7, Patrick Sereni8, Christopher O’Brien9, David W. Oldach10, Gerry Rhodes11,12,13

Background & Aims: GS-9190 is a novel non-nucleoside HCV NS5B polymerase inhibitor with potent in vitro antiviral activity (0.6 nM EC50 in Genotype 1b replicon) and a high selectivity index in vitro. Initial results from an ongoing single-dose/multi-dose escalation clinical trial of GS-9190 in HCV-infected volunteers are reported here. Methods: Study GS 196-0101 was a randomized, double-blind, placebo controlled trial designed to evaluate the safety/tolerability, pharmacokinetics and antiviral activity of single (in Part A) and multiple (in Part B) doses of GS-9190 in subjects chronically infected with HCV genotype 1 (GT-1) without cirrhosis. Prospective subjects are 18-60 years of age and are HCV treatment naives. In an already completed Part A, five successive cohorts of 6 subjects were randomized (5:1) to receive single ascending doses of GS-9190 (40, 120, 240, 240-with food, or 480 mg) or placebo. In ongoing Part B, four successive cohorts of 12 subjects are randomized (10:2) to receive multiple ascending doses of GS-9190 (40 mg BID, 120 mg BID, 240 mg QD, 240 mg BID) or placebo, over 8 days. Results: Thirty-one subjects enrolled in Part A were of mean age 43.6 years, predominantly male (20/31), Caucasian (25/31), and infected with either HCV Genotype-1a (24) or 1b (6). Median (range) baseline HCV viral load was 6.6 log10 RNA IU/mL (5.2-7.3). Single doses of GS-9190 were well tolerated, with no serious or treatment-limiting adverse events (AEs) reported. All AEs (except one moderate) were mild in severity, with the most common being headache. There were no Grade 3 or 4 treatment emergent laboratory abnormalities. Median GS-9190 plasma half-life ranged from 10 to 15 hours across cohorts. Systemic exposure was increased approximately 2-fold when GS-9190 was administered with a high fat meal. Mean GS-9190 concentration 24 hours after the 240 mg fasted dose was >7-fold higher than the protein binding adjusted in vitro HCV GT-1b replicon EC50 value. Following single-dose exposure, maximal antiviral effect was observed at 24 hours, with median declines ranging from 0.46 to 1.49 log10 HCV RNA IU/mL across cohorts. Individual HCV RNA declines among all GS-9190 recipients ranged from 0.19 to 2.54 log10 IU/mL following single-dose exposure. Conclusions: This study demonstrates potent dose-dependent antiviral activity of GS-9190, a novel non-nucleoside HCV polymerase inhibitor in HCV infected volunteers. Single dose exposure to GS-9190 was well tolerated and demonstrated favorable PK properties that may support QD or BID dosing. The multiple dose phase of this trial is ongoing, and updated results will be provided.

TELAPREVI VIR RESISTANCE MUTATIONS IN PATIENTS WITH HEPATITIS C WHO RELAPSED AFTER SEQUENTIAL THERAPY WITH TELAPREVIR, PEG-INFERNER ALFA 2A AND RIBAVIRIN

Nicole Forestier1,2, Simone Susser2, Martin W. Welker2, Christine J. Weegeink3, Hendrik W. Reesink3, Stefan Zeuzem1,2, Christoph Sarrazin1,2,13,14

Introduction: Telaprevir (TVR) is a highly selective inhibitor of the hepatitis C virus (HCV) NS3/4A protease with highly effective blocking of HCV replication in patients with hepatitis C. Mutations have been identified in the NS3 protease gene at positions 36, 54, 155 and 156 conferring resistance to TVR in vitro and in vivo. For single resistance mutations an inverse correlation of resistance level and viral fitness has been described while combined mutations (i.e. V36/R155) display relative high resistance with compensatory effects on replication efficiency. Little is known about persistence of TVR resistance mutations in patients treated sequentially with TVR, peg-interferon and ribavirin (RBV). Methods: Fifteen patients received either TVR monotherapy or TVR peg-interferon alfa 2a combination therapy for 2 weeks followed by peginterferon alfa 2a plus RBV...
standard combination therapy for 24 or 48 weeks. In the present study, we performed amplification and clonal sequencing (approx. 50 clones per patient and time point) of the HCV NS3 protease gene in 5 patients who relapsed so far. All 5 patients were tested HCV RNA negative during therapy but relapse with increasing HCV RNA concentration was observed after the end of standard combination treatment for 24 or 48 weeks. Results: While in 2 patients no mutations conferring resistance to TVR were detected during different time points after relapse, in 3 patients known TVR resistance mutations within the NS3 protease gene were detected. Patient 1 with initial TVR monotherapy, 48 weeks of standard therapy, and relapse at week 4 after treatment discontinuation (433,000 IU/ml) showed mutations at positions V36 (100% of clones) and R155 (100% of clones). In patient 2 with initial TVR monotherapy, 24 weeks of standard treatment and relapse at week 4 (viral load pending) only single isolates with resistance mutations were observed at position V36 (2%) and A156 (2%). Finally, patient 3 received initially combination therapy followed by 48 weeks of standard treatment. In this patient relapse was detected at follow up week 8 (1,400 IU/ml) and resistance mutations were detected at position V36 (84% of clones) only. In both patients who received TVR monotherapy mutations at positions V36, T54, R155 and A156 were observed during the initial 2 weeks of treatment. Conclusion: In patients treated with TVR with and without peginterferon alfa-2a for 2 weeks followed by standard therapy with peginterferon and RBV for 24 or 48 weeks mutations conferring resistance to TVR can be detected after relapse. The significance of TVR resistance mutations for the probability of relapse has to be investigated in future studies.

Background/Aim Albinterferon alfa (alb-IFN) is a novel recombinant protein consisting of IFNa-2b genetically fused to human albumin. This randomized Phase 2 study evaluates the efficacy and safety of alb-IFN/ribavirin treatment in chronic Hepatitis C (CHC) patients who were non-responders (NR) to previous IFNa-based regimens. Methods Subjects were randomized into 3 alb-IFN treatment cohorts (900mcg Q2w, 1200mcg Q2w or 1200mcg Q4w) in combination with weight-based oral ribavirin (RBV) 1000-1200 mg/day. After evaluating safety data, 2 further cohorts were treated with higher doses of alb-IFN 1500mcg Q2w and 1800mcg Q2w. The treatment duration is 48 weeks and the primary efficacy end-point is sustained virologic response (SVR) at 24 weeks posttreatment. The protocol was amended to allow extended treatment (a total of 72 weeks) for slow responders, ie, subjects who became RNA negative after w24. Results The demographics and antiviral response for the 115 patients enrolled are summarized in the table. The 1500 and 1800mcg treatment groups had more patients with baseline characteristics associated with poor response (eg, pretreatment HCV RNA, Peg-IFN+RBV NR, % African-Americans). All doses were well tolerated and the safety profile in the 1500 mcg and 1800 mcg cohorts was comparable to the 900-1200mcg cohorts in incidence and types of adverse events. The overall SVR rate for the first 4 treatment groups was 19% (18/93), though lower in the genotype 1, Peg-IFN+RBV NR group 12% (7/57). Importantly, the 1800mcg group showed robust antiviral response (50% [6/12] achieved EVR12) in genotype 1 “null-responders” to prior Peg+RBV therapy. Conclusions Alb-IFN in combination with oral RBV is safe and effective. Treatment with 1800mcg Q2w demonstrates significant antiviral activity in prior IFNa non-responder patients.

52 VALIDATION OF A GENE SIGNATURE PREDICTING RESPONSE TO TREATMENT IN CHRONIC HEPATITIS C VIRUS INFECTIONS

Limin Chen1,2, Ivan Borozzan3, Jing Sun1, Nitasha Anand4, Jenny Heathcote5, Aled Edwards1,2, Ian McGilvray5, Banting and Best Department of Medical Research, University of Toronto, Toronto, ON, Canada; 2Dept of Medical genetics and Microbiology, University of Toronto, Toronto, ON, Canada; 3Dept of Medicine, University of Toronto, Toronto, ON, Canada; 4Dept of Medical genetics and Microbiology, University of Toronto, Toronto, ON, Canada; 5Dept of Surgery, University of Toronto, Toronto, ON, Canada

Introduction: We previously identified an 18-gene signature that predicts treatment response in chronic hepatitis C (CHC) in a population of 31 patients (Chen, et al. Gastroenterology 2005). In this study we asked whether its predictive capacity held true for a larger cohort. Methods: Liver biopsies were taken from 78 CHC patients prior to initiating treatment with peginterferon/ribavirin. RNA was extracted, amplified, and gene expression was studied using a 19K cDNA microarray. CHC liver biopsies were compared to biopsies from 20 normal, uninfected livers. In the meantime, the expression levels of 10 of the genes from our previous set of 18 were assessed by real-time PCR. Classification accuracy was assessed using 4 different methods (KNN, DQDA, DLDA, CART). Results: All four classification methods yielded similar results. For predicting treatment “responders,” the 18 gene signature had a positive predictive value (PPV) of 92% (sensitivity 80%, specificity 86%).
There was higher variability in the 10 gene real-time PCR dataset, producing a lower PPV of 80% (sensitivity 75%, specificity 59%). In all, 123 genes were differentially expressed in CHC (p <0.001, fold < or > 1.5 compared to normal livers).

As in our preliminary study, pre-treatment expression of a number of interferon-stimulated genes (ISGs) was higher in nonresponder liver tissue. These included the ISGs in our predictive subset of 18 genes. When the 123 genes were analyzed by multivariate analysis, responder status and genotype were the two most important variables contributing to levels of gene expression. When a hierarchical cluster analysis was applied to only the genotype 1 samples using the genes most influenced by genotype, two clearly segregated clusters of patient samples were identified: one consisting of patients who went on to respond to treatment, and the other of patients who did not. Conclusion: The pre-treatment difference between responder and nonresponder liver tissue is robust over large numbers of patients, a finding that has implications for diagnosis and disease pathogenesis.

53 MULTIPLE DOSE SAFETY AND PHARMACOKINETIC STUDY OF BAVITUXIMAB IN PATIENTS WITH CHRONIC HEPATITIS C VIRUS (HCV) INFECTION
Eric J. Lawitz1, Eliot W. Godofsky2, Joseph S. Shan3; 1Alamo Medical Research, San Antonio, TX; 2University Hepatitis Center at Tustin, CA

Background: Bavituximab, an investigational monoclonal antibody targeting phosphatidylinerine (PS) located on the surface of virus infected cells and enveloped viruses, is being developed as an anti-HCV agent. It has immunostimulatory effects in preclinical viral models. Single intravenous (IV) infusions of bavituximab up to 6 mg/kg were well-tolerated and showed transient antiviral activity in chronic HCV patients. Methods: To determine the safety, tolerability and pharmacokinetics of multiple IV infusions of bavituximab, sequential cohorts of 6 patients were given twice weekly 90 min IV infusions for two weeks at 0.3, 1, 3 or 6 mg/kg and followed until week 12. Vital signs, physical exams, safety laboratory parameters, serum bavituximab levels and serum HCV RNA levels were measured. Results: Twenty-four patients (15 male, mean age 49) were enrolled. Eleven were non-responders, 8 were relapsers and 5 were treatment-naive. Mean baseline viral load was 5,000,000 copies/mL and 15 were infected with genotype 1, 8 with genotype 3 and 1 with genotype 2. The infusions were well-tolerated. No serious adverse events (SAEs) or early discontinuations were reported. There was no dose-related increase in incidence or severity of adverse events (AEs). All AEs were mild or moderate and transient, except for grade 3 neck pain and arthralgia (drug-related) in a patient with a history of joint pain at 3 mg/kg bavituximab and grade 3 elevated blood glucose (unrelated) in another patient with diabetes at 0.3 mg/kg bavituximab. All other drug-related AEs were mild: hypertension in 1 patient at 0.3 mg/kg, headache in 1 patient and headache and pruritis in 1 patient at 1 mg/kg and flu-like illness/symptoms in 2 patients at 6 mg/kg after the first infusion. Bavituximab reaches Cmax at 2-3 h postdose with a mean elimination half-life of ~34 h. Bavituximab exhibited dose-proportional increases in Cmax and AUC in single and multiple dosing and did not lead to significant accumulation. All dose levels exhibited on therapy antiviral activity (decline of >0.5 log10 reduction in HCV RNA). The 3 mg/kg cohort had the largest number of patients showing antiviral activity, as 5 of 6 subjects achieved >0.5 log decline in HCV RNA. Conclusions: Twice weekly IV doses of bavituximab up to 6 mg/kg were safe and well-tolerated. Single-dose and multiple dose pharmacokinetics of bavituximab are linear, predictable and no accumulation appears to occur over time. Two weeks of dosing is indicative of antiviral effect in a proportion of patients. Future studies designed to optimize the dosing schedule and investigate combining bavituximab with current standard therapy are planned.

54 RAPID AND EARLY VIROLOGICAL RESPONSE RATES ARE INCREASED WITH 12 WEEK 360 µG/WK PEGINFERON ALFA-2A (40KD) AND STANDARD RIBAVIRIN IN HCV GENOTYPE 1 TREATMENT NAIVE PATIENTS: EFFICACY AND SAFETY ANALYSIS OF THE INDUCTION PHASE OF THE CHARIOT STUDY
Stuart Roberts1, Martin Weltman2, Darrell Crawford3, Wendy Cheng4, William Sievert5, Geoffrey W. McLaughlan6, Paul V. Desmond7, Motoke Yoshishara8, John E. Miller9, Jean Depamphilis10, Pip Marks10, Gregory J. Dore10, CHARIOT Study Group On Behalf of the1; 1The Alfred Hospital, Melbourne, VIC, Australia; 2Nepean Hospital, Sydney, NSW, Australia; 3Greenslopes Hospital, Brisbane, QLD, Australia; 4Royal Perth Hospital, Perth, WA, Australia; 5Monash Medical Centre, Melbourne, VIC, Australia; 6Royal Prince Alfred Hospital, Sydney, NSW, Australia; 7St. Vincent’s Hospital, Melbourne, VIC, Australia; 8Roche Products, Sydney, NSW, Australia; 9Roche, Nutley, NJ; 10National Centre in HIV Epidemiology and Clinical Research, Sydney, NSW, Australia

Background: The CHARIOT study evaluates the efficacy & safety of a 360 µg/wk dose peginterferon alfa-2a (Peg-IFNα-2a) induction regimen compared to standard 180 µg/wk Peg-IFNα-2a, in combination with standard ribavirin (RBV) in treatment-naive patients with chronic hepatitis C genotype 1. We report results of the planned interim analysis of on-treatment virological responses over the first 12 wks of therapy. Methods: In this international, multi-centre, open label study patients were stratified by baseline HCV RNA and randomised 1:1 to 180 µg or 360 µg Peg-IFNα-2a qw for 12 wks followed by 36 wks of 180 µg Peg-IFNα-2a plus RBV 1000–1200 mg/d for 48 wks. Endpoints include virologic response at wks 4, 8 and 12. Results: 845 patients were evaluable for efficacy & safety analysis. Age, gender, weight, BMI, ethnicity, viral load and fibrosis scores were similar in the two groups. At wks 4, 8 and 12, virological response rates were greater (p<0.001) in the 360 µg/wk arm (Table). Significantly higher response rates (p<0.001) at wk 12 occurred in patients receiving 360 µg dose in all subgroups including baseline HCV RNA ≥800,000 IU/mL (71% vs 55%) and <800,000 IU/mL (84% vs 71%), weight ≥85 kg (74% vs 56%) and <85 kg (74% vs 62%), and age ≥40yrs (70% vs 54%) and ≤40yrs (84% vs 73%). Induction therapy was associated with higher rates of diarrhoea (17% vs 12%), pyrexia (14% vs 8%), chills (14% vs 7%) and weight loss (10% vs 3%). Depression and fatigue reports were similar. Discontinuations were similar in both groups, however induction therapy led to more dose modifications (Table). Use of haematopoetic growth factors was the same in both groups (4 patients [<1%]). Conclusion: Induction dosing with 360 µg/wk Peg-IFNα-2a is more effective than standard 180 µg/wk dosing in achieving early and rapid virological responses and is safe and well tolerated. The effect was independent of baseline viral load, weight, BMI and age.
55 DIET-INDUCED STEATOHEPATITIS IS PREVENTED BY MYD88 KNOCKOUT PHENOTYPE BUT NOT BY SELECTIVE MYD88 DEFICIENCY IN THE BONE MARROW-DERIVED CELLS IN MICE

Arumugam Velayudham, Istvan Hritz, Angela Dolganuc, Evelyn Kurt-Jones, Donna Catalano, Pranoti Mandrekar, Gyongyi Szabo

Background: Activation of inflammation-associated pathways is a major component in the progression of non-alcoholic fatty liver disease (NAFLD). Toll-like receptors (TLRs) expressed on hepatocytes and inflammatory cells in the liver recognize both pathogen-derived and endogenous mediators. A role for lipopolysaccharide (LPS) in the pathogenesis of NAFLD is suggested by the observation that polymorphisms in the components of the LPS receptors, CD14 or TLR4, are risk factors for NASH. Aim: To evaluate the role of TLR4 and its downstream signaling though MyD88 and to dissect the role of bone marrow-derived cells resulted in no protection from steatosis (triglyceride) and oxidative injury (TBARS and CYP2E1). Serum cytokines (TNFa, IL-10, IL-6, and KC) were equally increased in WT and WT/MyD88KO chimeric mice after MCD diet compared to MCS controls suggesting no protection against inflammation. Conclusions: Our results demonstrate a critical role for TLR4 and its MyD88-dependent downstream signaling in development of NASH-associated liver damage (steatosis and inflammation). However, the absence of the TLR4 adaptor, MyD88, in bone marrow-derived cells failed to prevent steatohepatitis pointing to a critical role for MyD88-dependent pathways in liver parenchymal cells. The role of TLR4 and MyD88 activation remains to be investigated in human NASH.

Disclosures: The following people have nothing to disclose: Arumugam Velayudham, Istvan Hritz, Angela Dolganuc, Evelyn Kurt-Jones, Donna Catalano, Pranoti Mandrekar, Gyongyi Szabo

56 ENHANCED INNATE IMMUNE RESPONSE AND ACCELERATED LIVER REGENERATION IN HEPATOCYTE-SPECIFIC IKK2 DELETED MICE

Yann Malato¹, Naïara Beraza¹, Leif Sander¹, Malika Almasaoudi², Manolis Pasparakis³, Christian Trautwein¹; ¹Internal Medicine III, Universitätsklinikum Aachen, Aachen, Germany; ²Department Of Genetics, University Of Cologne, Cologne, Germany

Liver regeneration is a complex mechanism involving a plethora of factors, and among them, the transcription factor NF-kB plays an important role. In non-stimulated cells, NF-kB is sequestered in the cytoplasm by IκB. Upon stimulation, IκB is phosphorylated by the IKK complex (consisting of two catalytic subunits IKK1 and IKK2, and the regulatory subunit NEMO), allowing NF-kB activation and translocation into the nucleus. As NF-kB is involved in early events of hepatocyte proliferation, we therefore studied the impact of hepatocyte-specific IKK2 deletion on liver regeneration. IKK2 constitutive knockout (ko) mice die in-utero. Thus, we generated C57BL/6L hepatocyte-specific IKK2 deletion (IKK2Δhepat) mouse using the Cre/LoxP system. 70% partial hepatectomy (PH) was performed on IKK2Δhepa mice (knock-out), and liver regeneration was studied. All mice survived after PH despite a weaker and delayed NF-kB response in IKK2Δhepa mice. In order to understand the role of IKK2 deletion during liver regeneration, we first analysed the priming phase. TNFα-mediated priming of hepatocytes and its ability to induce extracellular matrix remodelling via MMP9, are key events during liver regeneration. TNFα alpha protein expression was immediately up-regulated in IKK2Δhepa mice. 1h after PH, while wt mice exhibited a similar level 6h after PH. Moreover the MMP-9 protein activity was detected earlier in IKK2Δhepa mice, compared to IKK2Δwf mice, suggesting earlier priming in the ko animals. Then, we investigated Serum Amyloid A (SAA), a marker of the Acute Phase Response in mice. Interestingly, ko animals showed inflammatory activation and a mediator of insulin resistance, was significantly lower in MCD diet-fed TLR4KO and MyD88KO mice compared to WT mice. Conversely, the hepatoprotective cytokine, IL-6, and the anti-inflammatory cytokine, IL-10, were significantly higher in the sera of TLR4KO and MyD88KO MCD-fed mice compared to WT. These results suggested that MyD88-dependent pathways were critical in the development of both steatosis and inflammation. To determine whether MyD88 expression was critical in the parenchymal or in the inflammatory, BM-derived cells, we transplanted irradiated WT mice with MyD88KO bone marrow before MCD/MCS diet feeding. Selective MyD88 deficiency in BM-derived cells resulted in no protection from steatosis (triglyceride) and oxidative injury (TBARS and CYP2E1). Serum cytokines (TNFa, IL-10, IL-6, and KC) were equally increased in WT and WT/MyD88KO chimeric mice after MCD diet compared to MCS controls suggesting no protection against inflammation. Conclusions: Our results demonstrate a critical role for TLR4 and MyD88-dependent downstream signaling in development of NASH-associated liver damage (steatosis and inflammation).
a strong upregulation in mRNA expression already at 6h after PH compared to wt. Neutrophil chemoattractant chemokine KC mRNA expression was analysed by real time PCR. KC mRNA expression was enhanced in ko mice with a very significant increase at 6h after PH. This result led us to investigate the involvement of the immune response after PH via flow cytometry. We examined liver and blood cells 12h after PH, and IKK2\(_{\text{ΔIκBα}}\) mice exhibited higher number of neutrophils in both blood and liver, compared to wt animals. As a result of these early events, IKK2\(_{\text{ΔIκBα}}\) mice showed earlier hepatocytes proliferation compared to wt animals confirmed by BrdU analysis and cyclins expression. Our data demonstrate that hepatocyte-specific IKK2 deletion triggered a faster priming phase, an increased acute phase response along with a stronger neutrophils recruitment in the liver leading to an earlier hepatocyte proliferation in IKK2\(_{\text{ΔIκBα}}\) mice during liver regeneration.

57 DEPENDENCE OF THE ANTIVIRAL RIG-I-MAVS-IKK\(\varepsilon\) SIGNALING PATHWAY ON MITOCHONDRIAL RESPIRATION

Ting Wang, Kui Li, Stanley M. Lemon, Steven A. Weinman; University of Texas Medical Branch, Galveston, TX

A mitochondrially based signaling pathway, RIG-I - MAVS - IKK\(\varepsilon\), is required for endogenous interferon production in response to HCV infection and is specifically disrupted by the viral NS3/4A protease. However, the reason for the mitochondrial localization of this signaling pathway is unclear. We have previously observed that net signaling requires mitochondrial respiration but the mechanism for this is unknown. The aim of this study was to determine which elements of this signaling cascade require normal mitochondrial function. METHODS: Huh-7 based cell lines were incubated with a series of mitochondrial inhibitors, including rotenone, diphenylene iodonium and oligomycin, and subsequently challenged with Sendai virus (SV). To assess the activation of the signaling pathway, we examined dimerization of IRF-3, activation of interferon-\(\beta\) promoter or ISG-56 promoter, phosphorylation of STAT-1 and expression of ISG15. RESULTS: Inhibition of mitochondrial function prevented SV-induced IRF-3 dimerization, interferon-\(\beta\) promoter activation and ISG56 promoter activation. The inhibitors had no effect on SV infectivity or replication. The site of the block was examined by overexpressing a constitutively active fragment of RIG-I (N-RIG), MAVS, IKK\(\varepsilon\), or the constitutively active IRF-3-5D. Sensitivity to mitochondrial inhibitors was seen for N-RIG, MAVS, and IKK\(\varepsilon\) but not for IRF-3-5D. This approach thus localized the site of block to IKK\(\varepsilon\). We next examined whether the inhibitor effects resulted from changes in redox environment or ATP levels. Manipulation of mitochondrial redox status by either thiols antioxidants or exogenous peroxides did not affect SV induced IRF-3 dimerization. However, the mitochondrial inhibitors did produce an approximately 40% decrease in total cellular ATP. This decrease in ATP did not occur in all cell types and prevention of SV-induced IRF-3 dimerization occurred only in cell types in which an ATP reduction was observed. In CONCLUSION, mitochondrial respiration is required for activation of innate immunity pathways and this requirement appears to be due to strong ATP dependence of the IKK\(\varepsilon\) protein kinase. The need for this kinase to localize in a high ATP microenvironment could be one reason that this signaling complex is closely linked to mitochondria.

58 HEPATOCYTE CYCLOOXYGENASE-2 MEDIATES ENDOXIN-INDUCED ACUTE LIVER FAILURE

Chang Han, Kyu Lim, Quying Li, Lihong Xu, Tong Wu; Department of Pathology, University of Pittsburgh, School of Medicine, Pittsburgh, PA

Bacterial lipopolysaccharide (LPS; endotoxin) is an abundant and essential component of the outer membrane of Gram-negative bacteria. It provokes a generalized proinflammatory response in the infected host that can be associated with multiple organ dysfunctions including acute hepatic failure. LPS derived from intestinal bacteria is also implicated in the pathogenesis of chronic inflammatory liver diseases, such as chronic hepatitis, alcoholic liver disease and cirrhosis. We hypothesized that COX-2 activation in hepatocytes may trigger LPS-induced liver injury and, therefore, inhibition of COX-2 signaling pathway may attenuate LPS-induced tissue damage. To test this hypothesis, we generated transgenic mice with targeted expression of COX-2 in the liver by using the albumin promoter-enhancer driven vector. Although the COX-2 transgenic mice developed normally with no significant liver inflammation or histologic abnormality under normal housing conditions, they exhibited early mortality than wild type mice when the animals were subjected to a standard experimental protocol of LPS-induced acute fulminant hepatic failure (intraperitoneal injection of low dose of LPS in combination with D-galactosamine (GalN)). In COX-2 transgenic group (n=16), mortality became apparent at 5 to 6 h and all mice died by 9 h. In wild type mice (n=16), no death was observed at 6 h; first animal death was observed at 7 h. Under LPS/D-GalN treatment for 4 h, the COX-2 transgenic mice showed significantly higher serum ALT and AST levels and more prominent liver tissue damage (parenchymal hemorrhage, neutrophilic inflammation, hepatocyte apoptosis and necrosis) than wild type mice (p<0.01). Western blot analysis of the liver tissues showed that LPS/GalN treatment for 4 hours induced the cleavage of PARP, caspase-3 and caspase-9 in COX-2 transgenic mice but not in wild type mice. Pretreatment of the COX-2 transgenic mice with ONO-8711 (2.5 μg/mg body weight), a specific antagonist for the prostaglandin receptor EP1, prevented LPS/GalN-induced liver injury and hepatocyte apoptosis. Accordingly, the mice with genetic ablation of EP1 showed less LPS/GalN-induced liver damage and less hepatocyte apoptosis with prolonged survival when compared to the wild type mice (n=15 for each group). These findings demonstrate that COX-2 and its downstream prostaglandin receptor EP1 signaling pathway predispose the liver to LPS-induced injury. Therefore, blocking COX-2/EP1 pathway may represent an effective approach for reversal of LPS-induced liver failure.

59 LIVER DAMAGE IN A MOUSE MODEL OF FULMINANT AUTOIMMUNE HEPATITIS IS DEPENDENT UPON CD4\(^{+}\) T CELL PRODUCTION OF IFN-γ, BUT INDEPENDENT OF BOTH CD8\(^{+}\) T CELLS AND FAS

Richard T. Robinson\(^{2}\), M. Wesley Milks\(^{3}\), James D. Garham\(^{1,2}\); 1Pathology, Dartmouth Medical School, Lebanon, NH; 2Microbiology and Immunology, Dartmouth Medical School, Lebanon, NH; 3Dartmouth College, Hanover, NH

Autoimmune hepatitis (AIH) is thought to result from pathological activities of liver T cells, but mechanisms by which they cause hepatocellular damage remain unclear. Using the
BALB/c-TGF-β1−/− mouse model of fulminant AIH, we focused on the role of IFN-γ, examining both its cellular origin and possible effector mechanisms. Previously, we showed that both CD4+ T cells and IFN-γ are required for the development of liver damage. In the current study, we show that plasma IFN-γ concentration correlates very strongly with AST in twelve TGF-β1−/− mice evaluated ($r^2 = 0.49; p = 0.01$). Among liver lymphocyte subsets, CD4+ T cells are both most numerous and produce the most IFN-γ per cell, with decreasing contributions from CD8+ T and NK cells. Depletion studies using subset-specific monoclonal antibodies definitively show that CD4+ T cells, but not CD8+ T cells or NK cells, are necessary for both elevated plasma IFN-γ and hepatocellular damage. Evaluating potential effector roles for IFN-γ, IFN-γ is not required for TGF-β1−/− CD4+ T cell activation (all TGF-β1−/− or TGF-β1−/−/IFN-γ−/− double knockout liver CD4+ T cells are CD62L−/−, oligoclonal expansion (TGF-β1−/− CD4+ T cells and TGF-β1−/−/IFN-γ−/− CD4+ T cells exhibit non-Gaussian distributions on spectratype analysis), or accumulation in liver. IFN-γ is required for over-expression of class II genes in TGF-β1−/− livers, and likely acts via up-regulation of the co-activator CIITA. Finally, IFN-γ is required for FasL expression in TGF-β1−/− livers, and FasL is strongly expressed by TGF-β1−/− liver CD4+ T cells. However, liver damage developed unabated in fas-deficient TGF-β1−/−/lpr/lpr mice, ruling out a role for fas in the pathogenesis of liver disease in this model system. These data establish that CD4+ T cell production of IFN-γ is the key determinant of liver damage in this model system of AIH, and that liver damage is independent of both CD8+ T cells and Fas.

60 DELETION OF THE CHEMOKINE RECEPTOR CXCR3 LEADS TO INCREASED ACUTE LIVER INJURY AFTER CCL4 ADMINISTRATION

Mirko Moreno Zaldivar1, Petra Schmitz1, Frank Tacke1, Nikolaus Gassler2, Christian Trautwein1, Hermann E. Wassmann1; 1Medical Department III, University Hospital Aachen, Aachen, Germany; 2Department of Pathology, University Hospital Aachen, Aachen, Germany

Background: Chemokines may play important roles during acute and chronic liver injury through modulation of immune cell recruitment. The chemokine receptor CXCR3 is expressed on activated T-cells, NK cells, monocytes and dendritic cells. CXCR3 and its ligands CXCL9, CXCL10 and CXCL11 have been shown to be up-regulated in acute and chronic viral induced liver damage in mice and humans, but their functional role in liver injury has not yet been elucidated. Therefore, we investigated the function of CXCR3 in acute liver injury after challenge with carbon tetrachloride (CCL4). Material and Methods: Acute liver injury was induced in CCL4−/− mice and wildtype littermates (n = 4-6) through single administration of CCL4 (0.6 mg/kg). The degree of liver injury was assessed by liver histology (H&E staining) and serum transaminases at days 1, 3 and 5 after injury. Immune cell recruitment of T-cells, NK cells and NKT cells was assessed by FACS analysis at the same time points. The m RNA expression of characteristic Th1 (Interferon-gamma, Ifn-gamma) and Th2 (Interleukin-4, IL-4) cytokines within the liver was assessed by quantitative RT-PCR. Results: Compared to their wild type littermates, CXCR3−/− mice displayed significantly elevated AST and ALT levels 24 hours after CCL4 administration (P < 0.002). Increased liver injury in CXCR3−/− mice was also reflected by histology which showed extensive necrosis after 24 hours in the knockout animals, but only moderate necrosis in their wild type littermates. The histological difference between CXCR3−/− and wild-type mice was also evident at days 3 and 5 during the regenerative phase after liver injury. Interestingly, FACS analysis revealed significantly reduced intrahepatic numbers of T-cells, NK cells and NKT cells 24 hours after CCl4 administration in CXCR3−/− mice compared to wild-type mice (all P < 0.05). In CXCR3−/− mice, acute liver injury was associated with an increased hepatic expression of Ifn-gamma, while IL-4 was the predominant cytokine during liver regeneration at day 5. In contrast, level Ifn-gamma was the principal cytokine in wild-type mice during the acute and later phases of liver injury at the mRNA (P < 0.05 compared to CXCR3−/− mice). Discussion: Genetic deletion of CXCR3 leads to increased liver damage after toxic injury. The increased vulnerability of CXCR3−/− mice is associated with decreased numbers of liver infiltrating lymphocytes and a Th2 shift of the Ifn-gamma/IL-4 mRNA ratio during the regenerative phase. These results demonstrate an important role of the chemokine receptor CXCR3 in acute liver diseases.

61 ORPHAN NUCLEAR RECEPTOR SHP IS A NOVEL TUMOR SUPPRESSOR OF HEPATOCELLULAR CARCINOMA

Nan He, Kyungtae Park, Yuxia Zhang, Jiasheng Huang, Li Wang; Medicine & Pharmacology, University of Kansas Medical Center, Kansas, KS

Background: The small heterodimer partner (SHP, NROB2), a member of nuclear receptor superfamily, contributes to the biological regulation of several major functions of the liver. The aim of this study was to evaluate the novel role of SHP in cellular proliferation, apoptosis, and tumorigenesis in both mice and humans. Methods: Mouse embryonic fibroblasts (MEFs) derived from SHP+/+ and SHP/-/- mice were used as in vitro models to study the role of SHP on cell cycle regulation, apoptosis, and tumorigenesis. SHPKO and SHPTG mice served as in vivo models to elucidate the role of SHP on hepatoma formation. Human HCC specimens and HCC cell lines were used to determine the tumor suppressor function of SHP in human HCC formation. Results: Immortal mouse fibroblasts lacking SHP exhibited growth advantage, produced increased cyclin D1 mRNA and protein, and cyclin D1 associated kinase activity, and SHP was shown to be a direct negative regulator of cyclin D1 gene transcription. SHP/-/- fibroblasts also displayed characteristics of malignant transformed cells, including loss of contact inhibition, resistance to apoptotic stimuli, formation of more colonies in soft agar, and promoting tumor growth in immune compromised mice. Older SHP/-/- mice developed spontaneous hepatomas, which was strongly associated with an increased expression of cyclin D1 mRNA, enhanced cell proliferation, and decreased apoptosis of hepatocytes. In contrast, overexpressing SHP in hepatocytes of SHPTG mice inhibited proliferation and induced robust apoptosis. The expression of SHP was frequently down-regulated and SHP function was abrogated in human HCC pathological specimens and cell lines by transcriptional silencing due to SHP promoter hypermethylation. Overexpression of SHP inhibited HCC foci formation and cell invasion, increased the sensitivity of HCC cells to apoptotic stimuli, and arrested HCC tumor growth in xenografted nude mice. Conclusions: SHP suppresses tumorigenesis by negatively regulating cellular growth and modulating cell survival through targeting cell cycle regulator and antiapoptotic gene. We con-
62 TUMORIGENIC LIVER STEM CELLS EXPAND DURING AGING IN METHIONINE ADENOSYLTRANSFERASE 1A DEFICIENT MICE

Carl B. Rountree1,2, Shantha Senadheera3, Gay M. Crooks3, Shelly C. Lu1; 1Medicine, Keck School of Medicine USC, Los Angeles, CA; 2Division of Gastroenterology, Hepatology, and Nutrition, Childrens Hospital Los Angeles, Los Angeles, CA; 3Gene, Immunology, and Stem Cell Program, Childrens Hospital Los Angeles, Los Angeles, CA

Background and aim: Methionine adenosyltransferase (MAT) is an essential enzyme that catalyzes S-adenosylmethionine biosynthesis. Of the two genes that encode MAT, MAT1A is expressed in normal liver. Hepatic MAT activity falls in chronic liver diseases and mice lacking MAT1A develop hepatocellular carcinoma (HCC) spontaneously by 18 months. Our current work tests the hypothesis that liver stem cells may be the origin of HCC in this model. Methods: Livers from 6- and 18-month old MAT1A knockout (KO) mice and wild type (WT) littermates were fractionated into CD45- (leukocyte depleted), non-parenchymal (NP) cells and isolated by flow cytometry (FACS). CD45-NP cells were cultured using liver stem cell conditions. Gene expression was analyzed by real-time PCR. Bulk cultured cells and clones from single cells were analyzed using fluorescent immunohistochemistry (FIHC), RT-PCR, and Western Blot. Tumor formation was assessed using 1x106 CD133+CD49f+ cells injected intraperitoneally into immune-deficient mice. Results: The proportion of CD49f+ and CD133+ expressing cells within the CD45-NP fraction increased by 4.5 to 5.5-fold from 6 to 18 months in MAT1A KO mice but not WT mice (CD49f+ = 23±5%; CD133+ = 26±7% in 18-month KO mice; <7% all other groups, p<0.05). Compared to CD49f+ cells from old KO mice, CD49f+ cells from the same animals have marked increase in Kras (8-fold), Nras (4-fold), Survivin (4-fold), and Epidermal growth factor receptor (Egfr) (7-fold) mRNA levels. CD49f+ cells were selected in vitro using laminin coated plates. FACS analysis after 9 months of cultivation showed that 90.3±2.8% of cells have CD49f+ expression. Bulk culture of these CD49f+ cells demonstrated a rapidly proliferating group of small cells with expression of albumin, biliary cytokeratins, a fetoprotein, and c-Met by FIHC. Further sub-sorting of these CD49f+ cells revealed a population (15±7%) with CD133+ expression. Of the CD133+ cells, 99±0.4% have CD49f+ co-expression. Clonal expansion of single CD133+ cells isolated by FACS revealed maintenance of bi-potency, as well as strong expression of Hnf4, c-Met, and Egfr in 100% of expanded clones (N=4). After CD133+CD49f+ cells were injected into immune-deficient mice, 25% formed tumors of homogeneous, primitive, epithelial cells ranging in size from 4-6 mm after 6 weeks. Conclusions: MAT1A KO mice have expansion of liver stem cells as they age. These cells express increased levels of several oncogenes and are tumorigenic in vivo. This is the first demonstration of adult liver stem cells possessing tumorigenic potential without the use of a carcinogen or manipulation of tumor suppressor or oncogene expression.

63 COX-2-DERIVED PGE2 ACTIVATES β-CATENIN IN HUMAN HEPATOCELLULAR CARCINOMA CELLS: IMPLICATIONS FOR TARGETED CHEMOPREVENTION AND TREATMENT

Kyu Lim1, Chang Han1, Yifen Dai2, Lihong Xu1, Tong Wu1; 1Department of Pathology, University of Pittsburgh School of Medicine, Pittsburgh, PA; 2Department of Surgery, University of Pittsburgh, School of Medicine, Pittsburgh, PA

Recent evidence suggests that cyclooxygenase-2 (COX-2) and Wnt/β-catenin signaling pathways are implicated in hepatocarcinogenesis. This study was designed to examine the potential interaction between the COX-2-derived prostaglandin E2 (PGE2) and Wnt/β-catenin signaling pathways in human hepatocellular carcinoma (HCC) cells and to evaluate whether these pathways can be concomitantly blocked for effective inhibition of tumor growth. Immunohistochemical stains for COX-2 and β-catenin were performed in twenty paired human HCC and their matched nonneoplastic liver tissues. Increased cytoplasmic staining for COX-2 and nuclear staining for β-catenin were observed in HCC cells when compared with the nonneoplastic hepatocytes (p<0.01, n = 20). Treatment of cultured human HCC cells (Hep3B) with PGE2 induced dissociation of Axin from GSK-3β thus leading to β-catenin accumulation; this result provides novel evidence for activation of β-catenin by COX-2-derived PGE2 in human HCC cells. Furthermore, the levels of COX-2 and β-catenin proteins in Hep3B cells were significantly reduced by two ω-3 PUFAs, docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA). ω-3 PUFAs also inhibited PGE2 level through upregulation of the COX-2 antagonist, 15-hydroxyprostaglandin dehydrogenase (15-PGDH). Accordingly, DHA and EPA induced a dose-dependent apoptosis with cleavage of PARP, caspase-3 and caspase-9 in three human HCC cell lines (Hep3B, Huh-7, HepG2). Consistent with the above in vitro observations, the growth of HCC in vivo was significantly reduced when mouse HCCs (Hepa1-6) were inoculated into the Fat-1 transgenic mice which express a Caeonohabditis elegans desaturase converting ω-6 to ω-3 PUFAs endogenously (n = 10-12 for each group). These findings suggest that concomitant inhibition of COX-2/PGE2 and Wnt/β-catenin signaling pathways may represent a promising therapeutic strategy for effective chemoprevention and treatment of HCC.

64 LEPTIN IS A GROWTH FACTOR FOR CHOLANGIOCARCINOMA: AN IN VIVO EXPERIMENTAL STUDY

Gianmarco Fava1, Gianfranco Alpini2, Gianluca Svegliati-Baldoni1, Luciano Trozzi1, Stefania Sassomanno1, Chiara Rychlicki1, Cinzia Candelaresi1, Antonio Di Sario1, Marco Marzioni1, Antonio Benedetti1; 1Gastroenterology, Università Politecnica delle Marche, Ancona, Italy; 2Department of Medicine and Systems Biology and Translational Medicine, Central Texas Veterans HCS, Scott & White and The Texas A&M HSC, Temple, TX

Background: Few experimental carcinogenesis models of cholangiocarcinoma have been established. Leptin, a protein hormone principally produced by the adipose tissue, plays an important role in the regulation of angiogenesis and growth of...
several tumors. The obese Zucker fa/fa rat is characterized by the lack of leptin function due to the loss of functionality of the leptin receptor. Our recent data demonstrated that leptin enhances the growth of cholangiocarcinoma (CCA) cells in vitro. The Aim of the current study was to evaluate in vivo the effect of the lack of leptin function in regulating the development and growth of cholangiocarcinoma. Methods: Studies were performed in Zucker fa/fa rats and their corresponding littermates. Animals were chronically treated for 24 weeks with or without thiacetamide (TAA, dissolved in tap water at 0.03%), a carcinogenic factor for cholangiocytes. Animal and liver weight were measured and subsequently immunohistochemistry for CK-19 (a marker of biliary cells) and ErbB-2/Neu (overexpressed by malignant cholangiocytes) was performed to assess morphology and tumor growth. Results: After 24 weeks the average body weight showed that controls gained significantly more weight (lean 468.5 g ± 24.5, fa/fa 567.0 g ± 40.0; P < .05) compared to TAA treated rats (lean 299.6 g ± 12.9, fa/fa 417.1 g ± 16.7; P < .05). Liver weight from TAA treated animals also decreased after the ingestion of TAA (control lean 22.7 g ± 3.2 versus TAA-treated lean 16.3 g ± 0.6, P < .05; control fa/fa 26.4 g ± 0.5 versus treated fa/fa 21.2 g ± 1.5, P < .05). Macroscopically, 100% of the TAA treated Zucker lean rats developed multiple white, round and firm nodules over the hepatic surface, including the left, middle and right liver lobes. A reduced number of isolated white, round nodules were present on the liver surface of TAA treated-Zucker fa/fa rats. Morphological evaluation of liver tissue showed invasive intestinal-type CCA with intense stromal desmoplasia. Liver sections of TAA-treated Zucker lean rats showed a higher number of CK-19 and ErbB-2/Neu-positive malignant cholangiocytes compared to TAA-treated Zucker fa/fa rats, indicating that TAA-treated Zucker lean rats showed more tumoral tissue infiltrating their liver with respect to TAA-treated Zucker fa/fa rats. Summary/Conclusion: The lack of leptin-mediated signals reduces cholangiocarcinoma development and growth. Leptin is involved in the cholangiocarcinogenesis process and favors the growth of biliary malignancies. Thus, modulation of the leptin-mediated signal could be useful to counteract the growth of cholangiocarcinoma.

65 OVER-EXPRESSION OF IL-6 CONTRIBUTES TO CHolangiOCArcinoma INVASION BY MIR-21 DEPENDENT PATHWAYS

Fanyin Meng1,2, Roger Henson2, Hania Wehbe-Janek2, Heather Smith2, Tushar Patel2, 1,2 Internal Medicine, Ohio State University Medical Center, Columbus, OH; 2Scott & White Clinic, Temple, TX

Background: Interleukin-6 (IL-6) is over-expressed and has been implicated in the growth of many cancers, including cholangiocarcinoma. We have shown that over-expression of IL-6 can alter the expression of microRNAs and modulate cell signaling pathways involved in cholangiocarcinoma growth (JBC 2007). In this study, we investigated the involvement of aberrant miRNA expression by IL-6 in tumor cell growth and invasion in human cholangiocarcinoma cells. Methods: IL-6 over-expressing clones of Mz-CH-A-1 and KMCH-1 cholangiocarcinoma cells were generated by transfection with full-length IL-6, and designated as MzIL-6 and KMIL-6 respectively. The expression of miRNA in stable transfectants and parental cells was evaluated using a hybridization based microarray. miR-21 expression was confirmed by real-time PCR. miR-21 expression was modulated using miR-21 specific miRNA precursors or antisense oligonucleotides. Cell proliferation was assessed by a viable cell assay, and invasion was assessed by migration across tumor basement membrane. Expression of downstream targets of miR-21, namely PTEN and MMP-2 was assessed in vitro, and in tumor cell xenografts. Results: The growth of IL-6 over-expressing tumor cell xenografts was significantly increased compared to control. Selected microRNAs such as miR-21, miR-16-1 and members of the let-7 family were increased in both MzIL-6 and KMIL-6 cells. Of these, the greatest change was observed for miR-21 which was increased by 21.6 ± 2.1-fold and by 10.4 ± 0.7-fold in MzIL-6 and in KMIL-6 cells respectively compared to controls. Furthermore, miR-21 expression was increased by 4.5 ± 0.8-fold (p<0.05) in MzIL-6 tumor cell xenografts compared to controls. Cell invasion in vitro was also increased in MzIL-6 cells by 1.9 ± 0.2-fold and by 1.7 ± 0.2-fold in KMIL-6 cells compared to controls. Moreover, IL-6 induced tumor cell invasion was blocked by anti-miR-21 in MzIL-6 cells by 47 ± 9% and in KMIL-6 cells by 39 ± 7%. Anti-miR-21 also decreased IL-6 dependent expression of MMP-2 mRNA expression by 0.4 ± 0.1-fold. RNA interference mediated inhibition of PTEN, a downstream target of miR-21, increased cell invasion by 48 ± 6% in MzIL-6 cells. Summary and Conclusions: Over-expression of IL-6 contributes to cholangiocarcinoma growth and enhances tumor cell invasion by miR-21 dependent pathways. We conclude that targeting IL-6 dependent miR-21 mechanisms involved in tumor growth and spread will be a valuable therapeutic strategy for biliary cancers.

66 ESTABLISHMENT OF RAT LIVER CANCER STEM CELL LINES EXPRESSING GRANULOCYTE-COLONY STIMULATING FACTOR RECEPTOR (G-CSFR) AND ROLE OF G-CSF/G-CSFR AXIS IN MODULATING THEIR PROLIFERATION AND MIGRATION POTENTIAL

Anna C. Piscaglia1,2, Thomas D. Shupe2, Seh-Hoon Oh2, Nicole Steiger2, Antonio Gasbarrini1, Bryon E. Petersen2; 1Internal Medicine and Gastroenterology, Catholic University of Rome, Rome, Italy; 2Pathology, University of Florida, Gainesville, FL

Background and Aims. Oval cells (OC), putative liver stem cells, may give rise to liver cancers. We have developed a new regimen of carcinogenesis, based upon induction of OC proliferation followed by aflatoxin exposure. Aim of the present study was to establish liver cancer stem cell lines from our animal model. Materials and Methods. F344 rats were subjected to 2-regimen of carcinogenesis, based upon induction of OC proliferation followed by aflatoxin exposure. Animals were then injected with aflatoxin. Cancer cells were isolated from tumors, cultured, and single clones were selected. The established cell lines (LCSCs) were characterized for growth kinetics, morphology, immunophenotype, and karyotype. Tumorigenicity assays were carried out. In vitro proliferation and migration assays were also performed, to establish the effects of granulocyte-colony stimulating factor (G-CSF) and its receptor (G-CSFR) on LCSCs. Results. The primary tumors were well-differentiated hepatocellular carcinomas. Six cancer cell lines, LCSC[1-6], were developed. LCSCs adopted an epithelioid morphology, share with the primary tumors the expression of OC markers, and harbor a subpopulation of small G-CSFR+ cells. Transplantation studies proved the tumorigenicity and metastatic potential of LCSCs. Moreover, G-CSFR

Disclosures:
was expressed by both the primary tumors and all the LCSCs and its blockage inhibited LCSC proliferation and migration in vitro. Conclusions. We established 6 cell lines from our model of hepatocholangiocarcinoma. Phenotype, tumorigenicity, and metastatic potential suggest that LCSCs harbor a population of G-CSFR+/ cancer stem cells of OC origin. In the present study, we have also described the involvement of the G-CSF/G-CSFR axis in modulating LCSCs, and the inhibitory effects of G-CSFR blockage on LCSC proliferation and migration. These results may lead to new treatments against liver tumors, targeting stem cell-mediated cancer growth and preventing the establishment of metastases. Overall, LCSCs may be novel and useful cell lines for further studies of molecular pathways underlying hepatoccholangiocarcinogenesis, as well as for the development of new cancer stem cell-targeted therapies.

67 VARIABILITY OF THE ABCB4 GENE IN YOUNG ADULT CHOLECYSTECTOMIZED PATIENTS

Karl Esten Nakken1,2, Knut J. Labori2, Olaug Redningen3, Sigve Nakken4, Kristin Eiklid2, Morten G. Raeder1,2; 1Institute for Experimental Medical Research, Ulleval University Hospital, Oslo, Norway; 2Department for Gastrointestinal Surgery, Ulleval University Hospital, Oslo, Norway; 3Department of Medical Genetics, Ulleval University Hospital, Oslo, Norway; 4Centre for Molecular Biology and Neuroscience & Institute of Medical Microbiology, Rikshospitalet-Radiumhospitalet Medical Centre, Oslo, Norway

Aims and background: The ABCB4 (ATP-binding cassette, subfamily B (MDR/TAP), member 4) transporter expressed in the canalicular membrane of hepatocytes is responsible for phosphatidylcholine secretion into bile. Conceivably, variations of the ABCB4 gene could contribute to cholesterol gallstone formation through lowering biliary phosphatidylcholine secretion. The present study was undertaken to determine the frequency and type of ABCB4 genetic variability amongst patients < 40 years treated surgically for gallstone disease at a regional Norwegian surgical hospital. Materials and methods: One hundred and four patients (mean age 30 years, range 12-39) of Caucasian and Caucasoid ethnic background cholecystectomized on account of symptomatic cholesterol gallstone disease were included in the study. Genomic DNA from peripheral white blood cells was extracted on MagNApure LC from Roche. Coding exons 2 to 28 in the ABCB4 gene, (RefSeq NM_000443.3) including exon-intron boundaries were sequenced using an Applied Biosystem 3730 DNA Analyzer. Predictions of amino-acid substitution matrices (Grantham, BLOSUM62) and computational tools that utilize position-specific evolutionary properties of the protein (SIFT, PolyPhen). Results: 12 exon variations were found, 8 of which were protein-altering: 6 missense, 1 frameshift and 1 nonsense. 11 intron variants were found. Of the 8 protein-altering variations 5 were predicted to have functional consequences (c.523A>G, c.1769G>A, c.3318G>C, c.1399_1400 ins10, c.3136C>T). Conclusion: Substantial genetic variability exists amongst young Caucasian and Caucasoid patients < 40 years of age cholecystectomized at a Norwegian regional hospital. The ABCB4 genetic variations: c.523A>G, c.1769G>A, c.3318G>C, c.1399_1400 ins10, c.3136C>T may contribute to an early debut of cholesterol gallstone disease.

68 HLA ASSOCIATION IN PRIMARY SCLEROSING CHOLANGITIS: DETECTION AND FINEMAPPING OF AN HLA INDEPENDENT SIGNAL IN THE COMPLEMENT GENE CLUSTER

Tom H. Karlsen1,2, Peter Croucher1,4, Jochen Hampe4,5, Andre Frankel6, Erik Schrump5, Annika Bergquist5, Erik Thorsby2, Benedicte A. Lie2, Kirsten M. Boberg1, Stefan Schreiber1; 1Medical Department, Rikshospitalet-Radiumhospitalet Medical Center, Oslo, Norway; 2Institute of Immunology, Rikshospitalet-Radiumhospitalet Medical Center, Oslo, Norway; 3Institute of Medical Informatics and Statistics, Christian-Albrechts-University, Kiel, Germany; 4Institute for Clinical Molecular Biology, Christian-Albrechts-University, Kiel, Germany; 5Department of General Internal Medicine, University Hospital Schleswig-Holstein, Kiel, Germany; 6Department of Gastroenterology and Hepatology, Karolinska University Hospital, Stockholm, Sweden

Background: An association between the risk of developing primary sclerosing cholangitis (PSC) and genetic variants within the HLA complex on chromosome 6p21 was detected 25 years ago. This genetic region contains more than 250 closely linked genes, the pinpointing of the genetic variants of relevance to PSC has proven extremely difficult. In an attempt to further refine the HLA association in PSC, systematic mapping of the entire HLA complex was performed in a large cohort of Scandinavian PSC patients. Materials and methods: 365 PSC patients and 368 healthy controls were genotyped for all classical HLA loci (HLA-A, -B, -C, DRB1, DRB3 and DQB1) using a sequencing based approach. A two-stage screen using single nucleotide polymorphism (SNP) markers was subsequently performed. In stage one, 420 SNPs were successfully genotyped with SNPlex® technology. Dissection of the association signals was performed using established statistical packages as well as novel statistical approaches. In stage two, saturation of a distinct risk region using additional 130 SNPs was performed to localize causative variants. Results: The SNP screen revealed the presence of a wide and complex association signal blurred by a strong-LD haplotype that may harbor several variants strongly associated with PSC, e.g. at HLA-B (add odds ratio [OR] HLA-B*08 = 3.5, 95% CI [2.6-4.5], p<10^-16) and MICA (OR micas253495_A = 3.5, 95% CI [2.7, 4.5], p<10^-16), which have been also reported in previous studies. When case haplotypes were proactively matched with randomly drawn control haplotypes at markers defining this strong-LD haplotype (i.e. HLA-B*08 and DRB1*0301), a distinct association signal became evident at the complement factor gene cluster within the central HLA class III region. Maximum association in this risk region was observed for a common allele at an intronic SNP (69% vs. 48%, OR=2.5, 95% CI [2.0, 3.1], p=10^-16). Interestingly, this allele maps to all known HLA risk haplotypes in PSC (i.e. DR3, DR6 and DR2), while previously reported protective HLA haplotypes in PSC (i.e. DR4, DR7 and DR11) predominantly carry the opposite allele at this position. Conclusion: The present dataset provides an extensive insight into the complexity of the HLA association in PSC. Multiple risk variants are likely to exist, some of which have been previously reported in other autoimmune diseases (e.g. at HLA-B and MICA), and others which are PSC-specific. Novel alignment strategies with known risk and non-risk HLA haplotypes in PSC helped to dissect a distinct risk locus for PSC in the central HLA class III region. Ongoing analyses aim to identify the exact susceptibility gene within this region.
THE NATURAL HISTORY OF SMALL-DUCT PRIMARY SCLerosing CHOLANGITIS

Einar Björnsson1, Rolf Olsson1, Annika Bergquist2, Stefan Lindgren3, Barbara Braden4, Roger Chapman4, Kirsten Boberg5, Paul Angulo6; 1Section of Gastroenterology and Hepatology, Department of Internal Medicine, Gothenburg, Sweden; 2Section of gastroenterology and Hepatology, Karolinska University Hospital, Stockholm, Sweden; 3Department of Medicine, Malmo General hospital, Malmo, Sweden; 4Department of Medicine, John Radcliffe hospital, Oxford, United Kingdom; 5Department of Medicine, Rikshospitalet, Oslo, Norway; 6Department of Medicine, Mayo Clinic College of Medicine, Rochester, MN

Background: Previous studies suggested that patients with small-duct primary sclerosing cholangitis (PSC) have a favorable prognosis in comparison to those with large-duct PSC. Prior studies, however, have included limited numbers of patients with a relatively short follow-up, with minimal or no power for an appropriate analysis of long-term survival. Hence, we aimed at determining the natural history and long-term prognosis of a large number of patients with small-duct PSC and to compare the outcomes and survival to that seen in appropriately matched patients with classic large-duct PSC.

Methods: Data from 83 patients with well-characterized small-duct PSC from several medical institutions in Europe and the United States were combined. Each patient with small-duct PSC was randomly matched to two patients with well-characterized large-duct PSC by age, gender, calendar year of diagnosis, and institution. Outcomes included development of cholangiocarcinoma (CCA), need for liver transplantation, and death. The Kaplan-Meier product limit was used for estimating survival free of liver transplantation.

Results: The median age at diagnosis in both groups was 38 years with 61% being males. Cases of small-duct PSC had a significantly longer survival free of liver transplantation as compared to controls with large-duct PSC (p<0.0001, logrank test). The median follow-up was 13 years (interquartile range 10-17) in the small-duct PSC group and 10 years (interquartile range 6-14) in the large-duct PSC group. Nineteen (22.9%) out of the 83 small-duct PSC patients progressed to large-duct PSC as verified by cholangiography. One patient with small-duct PSC who progressed to large-duct PSC was diagnosed with CCA but after large-duct PSC had been identified; 20 patients in the large-duct PSC group developed CCA during follow up. The number of deaths and liver transplant procedures performed was 11 and 8 respectively in the small-duct PSC group, and 45 and 33 respectively in the large-duct PSC group. The proportion of patients dying and/or undergoing liver transplantation was higher in the large-duct than small-duct PSC group (49.7% vs. 25.7% respectively, p<0.0001). Interestingly two patients originally transplanted for end-stage small-duct PSC developed recurrent small-duct PSC in the graft requiring re-transplantation 9 and 13 years later. Conclusions: Patients with small-duct PSC have significantly better long-term survival than patients with large-duct PSC. Almost a fourth of patients with small-duct PSC progress to large-duct PSC over an average of 13 years of follow-up. Cholangiocarcinoma does not seem to occur in patients with small-duct PSC.

MULTI-CENTER, DOUBLE BLIND, RANDOMIZED CONTROLLED TRIAL OF ZIDOVUDINE AND LAMIVUDINE (COMBIVIR) THERAPY FOR PATIENTS WITH PRIMARY BILIARY CIRRHOSIS

Andrew L. Mason1, Keith D. Lindor2, Bruce R. Bacon3, Catherine Vincent4, James M. Neuberger5, Shawn T. Wasilenko6; 1Medicine, University of Alberta, Edmonton, AB, Canada; 2Medicine, Mayo Clinic, Rochester, MN; 3Medicine, St. Louis University, St. Louis, MO; 4Medicine, University of Montreal, Montreal, QC, Canada; 5Medicine, University of Birmingham, Birmingham, United Kingdom

A human betaretrovirus resembling the mouse mammary tumor virus has been linked with primary biliary cirrhosis. Biochemical and histological improvement has been reported in uncontrolled pilot studies of PBC patients receiving Combivir. Aim: To conduct a proof of concept trial linking viral infection with PBC.

Methods: 59 PBC patients on 13-15 mg/kg ursodeoxycholic acid for 4 or more months with an alk phos level > 1.5 upper limit of normal were entered into the study. A stratified randomization process using a double blind was employed to match biochemical abnormalities in both study arms. Patients received either 300mg Zidovudine and 150mg Lamivudine (Combivir) BID or placebo BID for 6 months. Serial hepatic biochemistry levels were evaluated from baseline, 1, 3, and 6 months with a 6 month wash out period; virus was detected by RT-PCR using human betaretrovirus env primers. The established endpoints were normalization of alk phos, ALT or AST, normalization of AST and ALT; as well as 50% reduction from baseline to normal range for alk phos, ALT and AST. Data were used for analysis if patients remained on therapy for 3 or more months.

Results: No differences in baseline hepatic biochemistry were observed in the Combivir (n=29) or placebo (n=30) arms; 7 patients were withdrawn from the study (4 Combivir and 3 placebo). A serial reduction in mean alk phos levels was only observed in patients taking Combivir (p<0.0001), where the levels decreased incrementally over the 6 months treatment by > 100 IU/ml from baseline value. Likewise, significant reductions in mean ALT and mean AST were only observed in the Combivir patients (p<0.03). Endpoints were observed in 86% on Combivir and 46% of placebo patients; none achieved normalization of alk phos, 39% Combivir vs. 29% placebo normalized ALT, 32% Combivir vs. 19% placebo normalized AST and 23% Combivir vs. 19% placebo normalized both ALT and AST. Half normalization towards baseline was found in 32% Combivir vs. 19% placebo for alk phos, 69% Combivir vs. 42% placebo for ALT and 68% Combivir vs. 35% placebo for AST. After 6 months, none of the Combivir patients had viremia vs. 19% of placebo patients. Combivir was well tolerated and the 2 serious adverse events occurred in patients randomized to placebo. Conclusions: In this proof of principal study, combination antiviral therapy provided significant but not substantial changes in hepatic biochemistry. This study supports the hypothesis that a human betaretrovirus plays a role in the pathogenesis of PBC. Combivir lacks potency and highly active anti-viral therapy may be required to halt disease in PBC patients with demonstrable retroviral infection.

71 CONTRIBUTION OF THE VARIANT P.V444A OF ABCB11 (BSEP) TO INTRAHEPATIC CHOLESTASIS OF PREGNANCY

Peter Dixon1, Jennifer Chambers1, Sandra Strautnieks2, Richard J. Thompson2, Frank Lammert3, Ralf Kubitz2, Anna G. Glantz2, Lars-Ake Mattsson4, Guedrun E. Moore5, Catherine Williamson1; 1Maternal and Fetal Medicine, Imperial College, London, United Kingdom; 2Liver Studies and Transplantation, Kings College, London, United Kingdom; 3Internal Medicine, University Hospital, Bonn, Germany; 4Gastroenterology, Hepatology and Infectious Disease, University of Dusseldorf, Dusseldorf, Germany; 5Obstetrics and Gynecology, Sahlgrenska University Hospital, Gothenburg, Sweden; 6Clinical and Molecular Genetics, Institute of Child Health, London, United Kingdom

Background: Intrahepatic cholestasis of pregnancy (ICP) has a complex aetiology with a significant genetic component. Genes mutated in progressive familial intrahepatic cholestasis (PFIC) (ABCC4, ATP8B1, ABCB11) have been implicated in the pathogenesis of the disease in a number of different studies in several populations. Heterozygous mutations of these canalicular transporters occur in a subset of cases, with the aetiology remaining unexplained in the majority of cases. ABCB11 encodes the bile salt export pump (BSEP), which is localized to the canalicular membrane and is a high-affinity ATP-dependent bile salt transporter. Homozygous mutations cause a spectrum of disease ranging from PFIC to benign recurrent intrahepatic cholestasis (BRIC). A polymorphism at position 444 of the protein (valine to alanine, c.1331C>T, rs2287622) has been reported to be associated with reduced expression of BSEP. Two previous studies in small groups of patients have implicated this polymorphism in ICP and drug-induced cholestasis. Patients and Methods: We investigated the role of V444A in ICP by screening a large patient group consisting of 491 Caucasian cases, from a combined resource of UK and European samples. A control group (261 Caucasian women) with uncomplicated pregnancies were also typed for the polymorphism. PCR primers from the UCSF website (http://pharmacogenetics.ucsf.edu/set1/index.html) were used to amplify and sequence patient DNA using an Applied Biosystems 3100 genetic analyser. Electropherograms were analysed using Codoncode Aligner software, and results checked by an independent observer. Results: Analysis of total alleles showed an association of the variant with ICP (OR 1.70, 95%CI 1.37-2.11). A significant difference was observed in genotype frequencies between the case and control groups (Chi-squared 22.778, p<0.001). Comparisons of individuals homozygous for the wild-type (C) or variant (T) allele showed that women with the TT genotype were more likely to develop ICP (OR 2.8 (95%CI 1.8-4.6)). Heterozygotes for the T allele also showed increased risk of ICP (OR 1.8 (95%CI 1.3-2.6)). Conclusion: Our study represents the largest into genetic variation and ICP to date. Our results indicate that the p.V444A polymorphism is a risk factor for ICP in this population.

72 VARIATION IN THE MDR3 GENE INFLUENCES DISEASE PROGRESSION IN PSC PATIENTS AND DISEASE SUSCEPTIBILITY IN EPISTATIC INTERACTION WITH A POLYMORPHISM IN THE OST-α GENE

Espen Melum1,2, Kirsten M. Boberg1, Andre Franke3, Annika Bergquist4, Jochen Hampe5, Stefan Schreiber3, Benedictie A. Lie2, Erik Schrumpf1, Tom H. Karlsen1,2; 1Medical Department, Rikshospitalet-Radiumhospitalet Medical Center, Oslo, Norway; 2Institute of Immunology, Rikshospitalet-Radiumhospitalet Medical Center, Oslo, Norway; 3Institute for Clinical Molecular Biology, Christian-Albrechts University, Kiel, Germany; 4Department of Gastroenterology and Hepatology, Karolinska University Hospital, Huddinge, Stockholm, Sweden; 51st Department of Medicine, Christian-Albrechts University, Kiel, Germany

Background and aims: The multi drug resistance 3 gene (MDR3) on chromosome 7q21 encodes a phospholipid transporter of importance to cholangiocyte membrane integrity and bile solubility (ABCB4; ATP-binding cassette, sub-family B, member 4). Knockout mice of the murine MDR3 analogue (mdr2) develop a cholestatic disease resembling primary scarring cholangitis (PSC) in humans. The aim of the present study was to investigate the influence of polymorphisms in the MDR3 gene on disease susceptibility and progression in PSC. Genes encoding other transport proteins in the biliary tract were studied simultaneously to evaluate gene-gene interaction (epistasis) on disease susceptibility. Methods: Single nucleotide polymorphisms (SNPs) covering 10 genes encoding transport proteins for a variety of bile constituents (ABCB4, BSEP, FIC1, MRP2, MRP3, MRP4, ASBT, I-BABP, OST-α and OST-B) were genotyped with SNPlux® technology in 365 Scandinavian PSC patients and 368 healthy controls. Association testing was performed with the Chi-squared test, and epistatic effects were evaluated using logistic regression. Survival was defined as the time from the diagnostic cholangiography to the combined endpoint of death or liver transplantation. Effects from genotypes on disease progression were evaluated with Cox regressions. Results: No associations with PSC susceptibility were seen for any of the individual SNPs. An epistatic interaction between the MDR3 SNP rs8187799 and the OST-α SNP rs11185519 affected PSC risk (p=6.6 x 10^-4). This effect was robust to correction for multiple comparisons using Bonferroni (p<0.01). Two MDR3 SNPs in linkage disequilibrium significantly influenced survival: rs1202283 (AA vs. AG+GG: median 9.8 vs. 14.4 years) and rs4148809 (AA vs. AG+GG: median 9.6 vs. 15.4 years). In Cox regressions, patients homozygous for the A allele at rs1202283 and rs4148809 had an increased risk of death or liver transplantation (hazard ratio (HR)=1.6, p=0.006 and HR=1.7, p=0.002, respectively). To rule out that this effect was caused by a higher age at diagnosis of PSC or concomitant cholangiocarcinoma, patients with cholangiocarcinoma were excluded and age adjusted Cox regressions were performed, with no changes in result (rs1202283 HR=1.7, p=0.007 and rs4148809 HR=1.8, p=0.002). Conclusions: Although no associations with any individual SNPs were seen, our present data provide interesting evidence that polymorphisms in the MDR3 gene influence disease progression in PSC patients, and susceptibility to develop PSC in epistatic interaction with a polymorphism in the OST-α gene.

THE PROTEIN KINASE G-VASODILATOR STIMULATED PHOSPHOPROTEIN PATHWAY DISRUPTS HEPATIC STELLATE CELL DRIVEN ANGIOGENESIS BY DISRUPTING FOCAL ADHESION FORMATION

Ningling K. Decker1, Kenneth D. Bloch2, Vijay Shah1, 1Gastroenterology Research Unit, Mayo Clinic, Rochester, MN; 2Massachusetts General, Charlestown, MA

Background. Cirrhosis and portal hypertension are associated with prominent remodeling of the sinusoidal vessels that includes enhanced hepatic stellate cell (HSC) coverage of endothelial cell (EC) lined sinusoids. We have previously demonstrated that nitric oxide [NO] disrupts rac1 dependent HSC migration and ensuing HSC driven angiogenesis. In this study we further examined the signaling intermediates downstream of NO and rac1 that regulate HSC adhesion, migration, and vascular tube formation. Results. Activation of the kinase downstream from NO, protein kinase G (PKG), by overexpression of constitutive active PKG resulted in a reduced capability of HSC to form vascular tube structures in matrigel 6 hrs after seeding (tube length [arbitrary units]; AdGFP: 10180 +/- 847 vs. AdPKGc: 5135 +/- 1025, P<0.05, n=3), suggesting that PKG activation significantly inhibits HSC adhesion and migration. Since focal adhesions are essential for cell adhesion and migration, we explored further how the PKG pathway may regulate focal adhesion function in HSC. The cytoskeletal regulatory protein, vasodilator-stimulated phosphoprotein (VASP), plays a pivotal role in actin dynamics and actin-based cellular structure formation and thus acts as an important regulator of cell-cell adhesion, cell-matrix adhesion and cell migration. Western blot analysis and immunofluorescence microscopy showed that VASP was highly phosphorylated in response to PKG activation, colocalized with the focal adhesion marker, vinculin within focal adhesion complexes, and also co-precipitated with vinculin (n=3). PKG activation induced translocation of phospho-VASP-vinculin complexes from focal adhesions to peripheral plasma membrane, in association with loss of HSC adhesive capacity. Inhibitory effects of PKG activation on HSC adhesion and vascular tube formation appeared to be mediated by VASP because siRNA knockdown of VASP partially reversed this phenotype. Next, to explore the role of VASP in the regulation of Rac1 and its effector protein, IQGAP, we performed immunoprecipitation assay using anti-IQGAP antibody. VASP was found to reside in a complex with vinculin, rac1 and IQGAP in HSC. Conclusion. These studies suggest that VASP may serve as a counter-regulator between NO inhibition of HSC motility and rac dependent activation of HSC motility. Thus, these studies provide mechanistic insights into the regulation of HSC migration and vascular tube formation, which are key steps in the process of HSC driven sinusoidal remodeling.

ANGIOGENESIS IN EXPERIMENTAL HEPATOPULMONARY SYNDROME (HPS)

Junlan Zhang1, Bao Lue1, Yongming Wang1, Joseph Barney2, Selvarangan Ponnavazhi1, Michael B. Fallon1, 1Medicine, University of Alabama at Birmingham, Birmingham, AL; 2Pulmonary/Allergy/Critical Care, University of Alabama at Birmingham, Birmingham, AL

Introduction: HPS occurs in 10-30% of patients with cirrhosis and increases mortality. It is classically thought to result from vasoilatation in the pulmonary microcirculation although whether angiogenesis is also important is unknown. Experimental biliary cirrhosis (CBDL) triggers HPS while non-biliary cirrhosis (thioacetamide, TAA) does not. Aim: To evaluate pulmonary angiogenesis in CBDL and TAA cirrhosis. Methods: Control, 1, 2 and 3 week CBDL and 2 and 8 week TAA [200 mg/kg, TIW, i.p.] treated animals underwent evaluation. IM injection of recombinant adenovirus containing secretable human angiostatin and endostatin (rAAV A+E, 3 x 1011 particles) 2wk prior to CBDL was used to chronically inhibit angiogenesis. HPS was evaluated using lung physiologic (ABG/microsphere shunt) and molecular changes (eNOS, ED1, HO-1). Angiogenesis was evaluated by lung microvessel counts (factor VIII staining) and VWF and Flk-1. Results: CBDL animals, but not TAA animals developed physiologic and molecular alterations of HPS beginning at 2 wk. Microvessel density increased by 2 wk and was maximal at 3 wk in CBDL animals relative to control and TAA (2.9±0.2 fold-control, p < 0.005). These changes
were accompanied by a similar increase in pulmonary VWF (2.6±0.3 fold-control, p<0.001) and Flk-1 (2.4±0.5 fold-control, p<0.05) levels after CBDL relative to control and TAA. Pulmonary endothelial VEGF staining increased in CBDL animals. In contrast, Flk-1 levels decreased after CBDL and were unaltered after TAA. rAAV driven upregulation of circulating angiotatin and endostatin increased early mortality after CBDL (42% rAAV A+E vs 8% CBDL control) but did not influence systemic or portal pressures or liver histology relative to controls in survivors. rAAV A+E treated 3 wk CBDL animals had a significant reduction in pulmonary microvessel density (50% of CBDL control, p<0.005) accompanied by a significant decrease in both VWF and Flk-1 levels relative to CBDL controls (65% for each, p<0.001). The reduction in angiogenin was accompanied by normalization of ABGs and intravascular macrophage accumulation (ED1), a reduction in HO-1 protein levels and no significant change in eNOS levels. Conclusions: Experimental HPS after CBDL is accompanied by pulmonary angiogenesis, not found in TAA cirrhosis where HPS is absent. Delivery of angiogenin and endostatin prevents pulmonary angiogenesis and the gas exchange abnormalities of HPS. Angiogenin appears to be one important pathophysiologic process in experimental HPS and may provide novel therapeutic targets.

76 FXR BILE ACID RECEPTOR ACTIVATES FOCAL ADHESION KINASE IN ENDOTHELIAL CELLS

Amitava Das, Usman Yaqoob, Ningling K. Decker, Vijay Shah; Gastroenterology Research Unit, Mayo Clinic, Rochester, MN

Background. The bile acid receptor, FXR, has recently been demonstrated to promote endothelial cell (EC) migration in a process that contributes to vascular remodeling. Our recent work identified a novel role of FXR activation of MMP9 in the process of endothelial cell migration (JBC 2006). Focal Adhesion Kinase (FAK) is a tyrosine kinase that is implicated in cell migration through effects on actin cytoskeleton. The Aim of the present study was to determine the role of FAK and actin cytoskeleton on FXR regulation of endothelial cell motility. Methods. Endothelial Cells (EC) were incubated with vehicle or the FXR agonist, chenodeoxycholic acid (CDCA), in the presence or absence of MMP9 siRNA, and analyzed for cell motility by Time Lapsed Video Microscopy. FAK phosphorylation was analyzed by Western blot analysis while actin stress fiber formation was analyzed by immunofluorescence microscopy. Results. CDCA significantly increase EC velocity [(µm/sec) 0.0073 ± 0.0018 as compared to vehicle, 0.0044 ± 0.0018, p<0.05, n=3], actin stress fiber formation (Fluorescence intensity: 106.882 ± 11.278 vs. vehicle, 51.504 ± 25.248, p<0.0001), and FAK phosphorylation (n=3). These events were significantly inhibited by MMP9 siRNA (velocity [µm/sec]: 0.0039 ± 0.0021 as compared to CDCA alone; 0.0073 ± 0.0018, p<0.01, n=3). CDCA stimulation of EC was also associated with phosphorylation/activation of a cascade of signaling molecules important for actin remodeling and EC motility including paxillin, vinculin, Rac1, and Rho A kinase (n=3). Conclusion. This study supports a key role for FAK phosphorylation and stress fiber formation in the process of FXR-MMP9 dependent regulation of EC motility and migration, events which may have broad implications for FXR effects on hepatic vascular repair and remodeling.

77 ISCHEMIA MODIFIED ALBUMIN PREDICTS MORTALITY IN LIVER DISEASE PATIENTS

Nathan Davies1, Stephen Hodges1, Lisa Cheshire1, Rajeshwar P. Mookerjee1, Gert Matthes2, Rajiv Jalan1; 1The UCL Institute of Hepatology, University College London, London, United Kingdom; 2University of Leipzig, Leipzig, Germany

Introduction: Albumin is an abundant multifunctional plasma protein, with well documented ligand-binding, transport, antioxidant and enzymatic activities. It is exclusively synthesized by the liver and its circulating concentration is known to decrease in liver disease. We have previously demonstrated that albumin is damaged in patients with liver failure leading to a loss of transport and detoxification functionality (Hepatology(2005), 42(4) suppl.1, 222A). The ischemia modified albumin (IMA) test, based upon protein-metal binding capacity, was used to examine whether this measure of oxidative stress induced albumin damage can be related to outcome in hepatitis patients. This test is now used routinely in cardiac ischemia patients, though as these subjects are norm-albumenic no albumin corrections are employed. We also investigated whether an increase IMA is associated with an alteration in the binding ability of fatty acid site 1 (BS1) as this has been postulated as an alternate cobalt chelating region. Methods: IMA was determined using the albumin cobalt binding test in plasma obtained from healthy control (control, n=6) and biopsy confirmed cirrhotic (n=34) subjects. Albumin was measured using the bromocresol purple assay and the affinity of the fatty acid binding sites was determined using a spin-label (16 doxyl-stearate) titration and ESR spectroscopy. Patients were subsequently divided by 28 day mortality, into survivors (n=12) and non-survivors (n=22). Results: When the IMA levels were normalized to the albumin concentration, significant differences between the groups were observed (control vs survivors, p<0.01; control vs non-survivors, p<0.01, survivors vs non-survivors, p<0.05). No significant differences were observed between the groups when the IMA scores were compared without albumin level correction. Non-survivors were also associated with increased inflammatory indicators (CRP, 56±7 vs 26±10 mg/ml, p<0.05; white cell count 17.1±10±16.6 vs 7.8±10±6.0, p<0.001) A significant negative correlation between the IMA ratio (IMAR) and the fatty acid binding coefficient for site 1 (KB1, r=0.68 p<0.001) was observed. Conclusions: These findings suggest that albumin damage, measured as IMA, expressed as a ratio to the protein, may be a useful tool to evaluate disease severity in cirrhotic patients. In this study IMAR was found to be as sensitive as MELD for predicting outcome (78% sensitivity, 76% selectivity). This indicates that there is increased oxidative stress in liver disease that reduces the functional ability of albumin. We also observe that there is an associated effect at BS1 which may reflect multiple points of albumin damage.

78 VASCULAR HYPORESPONSIVENESS TO ANGIOTENSIN-II IN RATS WITH CCL4-INDUCED CIRRHOSIS IS ASSOCIATED WITH COMPLEXATION OF THE ANGIOTENSIN-II TYPE1 RECEPTOR WITH THE RECEPTOR-DESENSITIZING PROTEIN, BETA-ARRESTIN 2

Martin Hennenberg, Janel Trebicka, Andreas Eckhard, Tilman Sauerbruch, Jörg Heller; Department of Internal Medicine I, University of Bonn, Bonn, Germany

Background: In cirrhosis, portal hypertension is triggered by vasodilation due to impaired vasoconstrictor-responsiveness of
extrahepatic vessels. Angiotensin-II (ang-II) induced vasoconstriction is mediated by activation of the angiotensin-II type 1 receptor (AT1R) and its associated heterotrimeric G-proteins. Activation of G-protein coupled receptors (GPCR) causes their phosphorylation by GPCR-kinases, which enables binding of β-arrestin2 to the receptor. As a result of this, receptors are desensitized and G-protein mediated signaling (e.g. contraction cascades) is blunted. We have previously shown that vascular hyporeactivity to ang-II in rats with secondary biliary cirrhosis and humans with alcohol-induced cirrhosis is associated with increased binding of β-arrestin2 to the AT1R (Hepatology2007;45(2)). Here, we analyzed the interaction of the AT1R with β-arrestin2 in vessels from rats with CCl4-induced micronodular cirrhosis. Methods: Protein-expressions in aortas from rats with CCl4-induced cirrhosis and non-cirrhotic controls were investigated by Western-blot analysis. Contractility of aortic rings was determined myographically. Interaction of the AT1R with β-arrestin2 was assessed by coimmunoprecipitation. Results: Aortic rings from CCl4 rats were hypocontractile to ang-II despite inhibition of nitric oxide synthases by L-NNAME (200 mM). Expression of the AT1R, Goα/11, and the contraction-mediating effector, RhoA, were similar in aortas from both groups. Expression of β-arrestin2 was upregulated in aortas from CCl4 rats. Interaction of the AT1R with β-arrestin2 was increased in aortas from CCl4 rats. Stimulation of isolated aortas with exogenous ang-II (300 nM, 20 min) caused recruitment of β-arrestin2 in aortas from non-cirrhotic rats, but no further complexation of the AT1R with β-arrestin2 in aortas from CCl4 rats. Conclusions: Vascular hyporesponsiveness to ang-II in CCl4 rats is due to overexpression of β-arrestin2 and a subsequently enhanced complexation of the AT1R with β-arrestin2.

PROVE2: PHASE II STUDY OF VX950 (TELAPREVIR) IN COMBINATION WITH PegINTERFERON ALFA2A WITH OR WITHOUT RIBAVIRIN IN SUBJECTS WITH CHRONIC HEPATITIS C, FIRST INTERIM ANALYSIS

Christophe Hezode1, Peter Ferenci2, Geoffrey M. Dusheiko3, Stanislas Pol4, Tobias Goessler5, Jean-Pierre Bronowicki6, Shahngh Gharakhanian7, Desiree Devonish7, Robert Kaufman7, John Alam7, Jean-Michel Pawlotsky8, Stefan Zeuzem9; 1AP-HP Hepato-gastroenterology Services, Henri Mondor Hospital, Creteil, France; 2Internal Medicine III, Medical University, Vienna, Austria; 3Center for Hepatology, Royal Free Hospital, London, United Kingdom; 4AP-Ho Liver Unit, Necker-Cochin Hospitals, Paris, France; 5Gastroenterology & Hepatology, University of Cologne, Cologne, Germany; 6CHU, Nancy University Hospital Center, Nancy, France; 7Medical Development Group, Vertex Pharmaceuticals, Inc, Cambridge, MA; 8AP-Ho Dept of Bacteriology & Virology, Henri Mondor Hospital, Creteil, France; 9Internal Medicine Clinic II, Saarland University Hospital, Homburg/Saar, Germany

Background: PROVE2, study VX05-950-104EU is a randomized, placebo-controlled phase II study of telaprevir (TVR), in combination with pegylated interferon alfa2a (Peg-IFN) and ribavirin (RBV), in treatment naive subjects with genotype 1 chronic hepatitis C infection. Results of a planned interim, on-treatment, safety and efficacy analysis (IA) are reported. Methods: A total of 332 subjects were randomized into four groups. Group A received standard of care Peg-IFN 180 mcg/weekly + RBV 1000-1200 mg, weight-based and TVR-placebo for 48 weeks. Group B TVR 750 mg q8h together with Peg-IFN+RBV for 12 weeks, followed by Peg-IFN and RBV for a further 12 weeks. Group C, TVR 750 q8h with Peg-IFN + RBV for 12 weeks. Group D, TVR + Peg-IFN for 12 wks. The Roche Taqman assay was used to quantify plasma HCV RNA (LOD 10 IU/mL).
This first IA was performed when at least 90% of subjects completed the week 12 visit. Results: The median age was 45 years (18-65), median weight 70.9 kg (45-115), 58.7% were male, 94.1% Caucasian, 7.5% had stage F3 fibrosis, 34.1% were infected with genotype 1a, and 54.1% with 1b. The median baseline HCV RNA was 6.4 Log10IU/ml (3.3-7.7). Overall, discontinuation occurred in 6.4% of Group A, 17.1% of Groups B+C and 10.5% of Group D subjects prior to week 12. Discontinuations for AEs occurred in 2.6% of Group A, 12.5% of Groups B+C and 7.9% of Group D subjects. Pruritis, rash, asthenia, nausea, and anemia were the most common AEs associated with TVR; anemia and nausea were less frequent in Group D. The table summarizes ITT viral responses. Conclusion: TVR (telaprevir, VX950)+Peg-IFN+RBV produces a significantly greater, on-treatment, anti-viral response at weeks 4 and 12 compared to Peg-IFN+RBV in naive subjects with genotype 1 HCV. Dosing without RBV reduced the on-treatment anti-viral response; further follow-up will evaluate effects on SVR and relapse rates. Consistent with prior studies, the adverse event profile showed that skin events, nausea and anemia are the most important AE’s associated with TVR. Further results will confirm the optimal treatment duration and dosage regimen for Phase 3.

HCV RNA Un-detected

81 MULTICENTER RANDOMIZED CONTROLLED TRIAL OF CARVEDILOL VERSUS VARICEAL BAND LIGATION FOR THE PREVENTION OF THE FIRST VARICEAL BLEED
Dhiraj Tripathi1, James W. Ferguson1, Narendra Kochar1, Joanna A. Leithead, George Therapondos1, Norma C. McAvoy1, Adrian J. Stanley2, Ewan H. Forrest2, S. W. Hislop2, Peter R. Mills2, Peter C. Hayes1; 1Dept of Hepatology, Royal Infirmary, Edinburgh, United Kingdom; 2Dept of Gastroenterology, Victoria Infirmary, Glasgow, United Kingdom; 3Dept of Gastroenterology, Royal Infirmary, Glasgow, United Kingdom; 4Dept of Gastroenterology, Gartnavel Hospital, Glasgow, United Kingdom; 5Dept of Gastroenterology, Royal Alexandria Hospital, Paisley, United Kingdom

Background: Current therapy for preventing the first variceal bleed includes beta-blockers (BB) and variceal band ligation (VBL). A recent meta-analysis has shown VBL to have lower bleeding rates, with no difference in survival. BB therapy can be limited by side effects (SEs), and there are concerns regarding the safety of variceal band ligation (VBL). Carvedilol, a non-cardioselective vasodilating BB is more effective in reducing portal pressure than propranolol, but to date there have been no clinical studies assessing the efficacy of carvedilol in primary prophylaxis. Aims: To compare carvedilol versus VBL for the prevention of the first variceal bleed in a randomized controlled multicenter trial. Methods: 152 cirrhotic patients from 5 different centres with grade II or larger esophageal varices that have not bled were studied. Patients were randomized to either carvedilol at 12.5 mg per day or VBL, performed 2 weekly till eradication using a multibandr device. The primary end point was the first variceal bleed. Secondary end points were mortality, bleeding related mortality, side effects leading to treatment discontinuation and other adverse events. Intention to treat analysis was performed for all outcomes. Results: Over a 6 year period 77 patients were randomized to carvedilol and 75 to VBL. Baseline characteristics: Alcoholic liver disease, 72%; Child Pugh Score, 8.3 ± 2.6; age, 54.1 ± 10.3 years; median follow up, 15.7 months (range 0.16–79.1 months). Patients on carvedilol had significantly lower rates of the first variceal bleed (9% vs 21%; relative hazard 0.41; 95% CI 0.19 – 0.96; p=0.04)), with no significant differences in overall mortality (35% vs 37%, p=NS), bleeding related mortality (3% vs 1%, p=NS) and treatment discontinuation due to SE’s (12% vs 4%, p=0.08). 6 patients in the VBL group bled as a result of banding ulcers. Significantly more patients in the VBL arm underwent salvage TIPSS (2 vs 8; p = 0.045). All patients in the carvedilol group who discontinued therapy due to side effects were changed to VBL, and none have bled. Conclusions: This is the first study to demonstrate lower bleeding rates with BB therapy for primary prophylaxis compared with VBL. Carvedilol was well tolerated, while VBL had an unfavorable adverse events profile. Carvedilol, along with VBL should be considered for first line therapy in primary prophylaxis. VBL remains the only alternative in patients intolerant of carvedilol or those unlikely to comply with drug therapy. Careful selection of patients and attention to technique are required to reduce the risk bleeding from the banding procedure

82 PRESERVING RENAL FUNCTION IN LIVER TRANSPLANTATION: EFFICACY AND SAFETY OF A MYCOPHENO-LATE MOFETIL (MMF)/SIROLIMUS MAINTENANCE REGIMEN FOLLOWING CALCINEURIN INHIBITOR (CNI) WITHDRAWAL: INTERIM DATA FROM THE SPARE-THE-NEPHRON (STN) TRIAL
Lewis Teperman1, Anthony Sebastian2, Juan Arenas2, Linda Shea3, Baburao Konero4, Paul Marotta5, John P. Roberts6, Dharmesh Patel7; 1NYU School of Medicine, New York, NY; 2Integris Baptist Medical Center, Oklahoma City, OK; 3Henry Ford Hospital, Detroit, MI; 4University of Southern California, Los Angeles, CA; 5University of Medicine and Dentistry of New Jersey, Newark, NJ; 6London Health Sciences Hospital, London, ON, Canada; 7University of California, San Francisco, CA; 8Roche Laboratories Inc., Nutley, NJ

Purpose: Chronic renal insufficiency has become a progressively more significant problem as the long term survival of liver transplants improves. Since CNIs are associated with renal toxicity, we examined whether a CNI-free regimen, consisting of MMF and sirolimus (SRL) can better preserve renal function in recipients of liver allografts, while maintaining adequate
immunosuppression. Methods: This trial is a 2-year multicenter, prospective, randomized, controlled, open-label study with a projected enrollment of 340 patients. Four to 12 weeks post-transplantation, patients maintained on MMF and a CNI were randomized to MMF (1-1.5 g BID), together with either SRL (2-4 mg QD, trough 5-10 ng/mL) or a CNI (cyclosporine 3-5 mg/kg BID, trough 100-250 ng/mL; tacrolimus 0.1-0.15 mg/kg/day in 2 doses; trough 3-10 ng/mL). Primary endpoints included: mean percent change in calculated glomerular filtration rate (GFR; MDRD 6 equation; mL/min), percent of patients with biopsy-proven acute rejection (BPAR), graft loss, or death. Safety data included frequencies of adverse events. Results: Six-month interim data, involving 100 patients (50 per group) are discussed herein; updated data will be presented. Patient characteristics, including GFR values, were similar at baseline for both groups. In the CNI group, 2 patients received cyclosporine, and 48 received tacrolimus. At 6 months, mean increase in GFR from baseline was 29.0% (±39.36) in the MMF/SRL group and 4.5% (±24.12) in the MMF/CNI group. BPAR occurred in 6 (12%) of MMF/SRL patients and 2 (4%) of the MMF/CNI group; withdrawal rates were 28% (14/50) and 16% (8/50) respectively. There was one patient death in the MMF/SRL group. Increases from baseline in lipid/triglyceride levels were greater with MMF/SRL. Most common adverse events (MMF/SRL vs. MMF/CNI) were leukopenia (24% vs. 10%), pyrexia (24% vs. 10%), diarrhea (18% vs. 22%), and headache (18% vs. 14%); hyperkalemia occurred in 18% of MMF/CNI patients, but was not seen in any patient in the MMF/SRL group. Pharyngolaryngeal pain (12% vs. 4%); tongue and lip ulceration (2% vs. 2% each); stomatitis (6% vs. 0%); and mouth ulceration (2% vs. 0%) were reported in the MMF/SRL and MMF/CNI groups, respectively. Conclusions: Interim data suggest that MMF/SRL maintenance therapy results in improved renal function, as compared to CNI-containing regimens. More definitive conclusions about the long-term impact of maintenance with MMF/SRL will require complete follow-up of all 340 patients.

Background: Tenofovir disoproxil fumarate (TDF), an acyclic nucleotide reverse transcriptase inhibitor is approved for the treatment of HIV infections and has shown activity in HBV/HIV co-infected patients harboring both wild type and lamivudine resistant hepatitis B virus (HBV). In this retrospective multi center analysis we studied the effectiveness of TDF monotherapy in patients with HBV monoinfection with respect to virologic parameters and resistance. Methods: 121 patients with chronic HBV infection (m/f 87/34, mean age 45 ± 101 patients during TDF treatment (mean duration 14.8 ± 10 years) HBV DNA levels decreased from a mean baseline level of 6.7 ± 1.2 [1.4-6.7] log copies/ml at week 24 and 48, respectively. HBV DNA was undetectable (<400 copies/mL) in 72% and 91% of the patients at week 24 and week 48. There was no evidence of TDF resistance development as a rebound of HBV DNA >1 log was not observed in any of the patients studied. HBeAg seroconversion was documented in 23% of the patients after a mean TDF treatment duration of 9.3 ± 2.3 months, and HBSAg loss in 4% after 13.6 ± 9.18 months. 85 patients (70%) had elevated ALT levels at baseline while 78%

A PILOT RANDOMIZED CONTROLLED STUDY EVALUATING EFFICACY OF AUTOLOGOUS BONE MARROW MONONUCLEAR CELLS TRANSPLANTATION IN PATIENTS WITH ADVANCED CHRONIC LIVER DISEASE

André C. Lyra1, Milena B. Soares2, Luiz F. da Silva2, Eduardo L. Braga1, Sheilla A. Oliveira2, Marcos F. Fortes2, André G. Silva2, Patricia S. Brandão1, Bernd Genser1, Ricardo R. dos Santos2, Luiz G. Lyra1

1Internal Medicine - Gastrohepatology Service, Hospital Sao Rafael and Federal University of Bahia, Salvador-Bahia, Brazil; 2Fundacao Oswaldo Cruz - FioCruz, Salvador, Brazil; 2BGStats Consulting, Graz, Belgium

Studies in animal models of liver disease have shown that bone marrow cells (BMC) transplantation improves hepatic fibrosis and liver function. Other authors and we have recently demonstrated that autologous BMC therapy in patients with chronic liver disease is safe and feasible and may induce changes in liver function tests. Aim: To evaluate the efficacy of BMC transplantation in patients with advanced chronic liver disease. Methods: Thirty patients on the waiting list for liver transplantation were randomly assigned to receive BMC therapy or no treatment in a nonblinded fashion. Approximately 50 ml of bone marrow aspirate were prepared by centrifugation in a ficoll-hypaque gradient. A minimum of 100 millions autologous mononuclear-enriched BMC were infused into the hepatic artery. Baseline assessment included clinical, laboratorial and abdominal MRI evaluation. Serum albumin, bilirubin, INR, Child-Pugh and MELD score were chosen as endpoints to assess efficacy. Patients were closely assessed for clinical events and changes in liver function for 90 days. Statistical analysis was conducted by obtaining descriptive statistics, calculating mean changes from baseline and fitting a random effects model to compare the profiles of liver tests of both groups. Results: Mean age, baseline liver function tests (except for albumin), MELD and Child-Pugh score were similar in both groups. Albumin levels (g/dl) were higher in the control group (3.31 vs 2.79, p=0.053). During follow-up one patient died and one was liver transplanted in the control group while another patient died in the intervention group. No other major complications were detected in the remaining patients. Albumin levels increased in the treatment arm while they remained stable among controls up to 90 days (P=0.034; BMC group relative change from baseline (RC) = + 16%, control group RC = + 2%). Child Pugh score significantly decreased in the therapy group compared to the control group (P=0.017, BMC group RC = -8%, controls RC = + 4%). Bilirubin levels significantly increased among controls while they decreased in the treatment arm during the first 60 days after therapy and increased to baseline levels after 90 days. INR profile was not significantly different between both groups. Conclusions: Transplantation of autologous BMC into the hepatic artery appears to improve liver function of patients with advanced chronic liver disease at least for up to 90 days and might be a promising treatment option for these subjects. Larger studies with longer follow-up are necessary to validate our findings, to define the duration of this beneficial effect and to determine if there will be improvement of survival.

Disclosures: The following people have nothing to disclose: André C. Lyra, Milena B. Soares, Luiz F. da Silva, Eduardo L. Braga, Sheilla A. Oliveira, Marcos F. Fortes, André G. Silva, Patricia S. Brandando, Bernd Genser, Ricardo R. dos Santos, Luiz G. Lyra

THE BASOLATERAL TRANSPORTER OSTβ-OSTβ IS ESSENTIAL FOR INTESTINAL BILE ACID ABSORPTION AND HOMEOSTASIS

Anuradha Rao1, Jamie Haywood1, Ann L. Croudock1, Martin G. Belinsky2, Gary D. Kruh3, Paul A. Dawson2, 1Department of Internal Medicine - GI, Wake Forest University School of Medicine, Winston-Salem, NC; 2Medical Science Division, Fox Chase Cancer Center, Philadelphia, PA

Transport of bile acids from the intestinal lumen into the portal circulation is mediated by carriers expressed on the enterocyte apical and basolateral membranes. Several candidate intestinal basolateral transporters have been proposed including Mrp3 (Abcc3) and the heteromeric organic solute transporter, Ostα-Ostβ. Mouse Ostα-Ostβ exhibits many of the properties predicted for the intestinal basolateral bile acid transporter, including highest expression in terminal ileum, basolateral membrane localization, positive regulation of expression by bile acids, and transport substrate specificity that includes the major bile acid species. However, the in vivo functions of Ostα-Ostβ have not been determined. Hypothesis: Ostα-Ostβ functions in vivo as the major ileal basolateral bile acid transporter. Methods: The Ostα gene was inactivated by conventional gene targeting. Mucosal-to-serosal taurocholate transport was measured in vitro using everted gut sacs. Analysis of the in vivo phenotype included measurements of fecal bile acid excretion, bile acid pool size and composition, and gene expression. Results: The Ostα/- mice are viable and fertile, but exhibit growth retardation. Expression of the Ostβ partner protein was significantly reduced (> 95%), despite continued high-level expression of Ostβ mRNA. In everted gut sac experiments, ileal transmucosal transport of taurocholate was reduced approximately 85% in Ostα/- versus wild type or Mrp3/- mice. Since Mrp3 may serve as a secondary export system for bile acids, everted gut sacs were also analyzed from Ostα-Mrp3 double knockout mice, where trans-mucosal taurocholate transport was further reduced to background levels. As in Asbt/- mice, the bile acid pool size was significantly reduced (> 65%) in Ostα/- mice. However in contrast to Asbt/- mice, fecal bile acid excretion was not increased in Ostα/- mice, reflecting reduced hepatic synthesis. Whereas hepatic cholesterol 7α-hydroxylase (Cyp7a1) expression is induced ~5-fold in Asbt/- mice, Cyp7a1 expression was paradoxically reduced in the Ostα/- mice. The reduced hepatic Cyp7a1 expression correlated with increased ileal expression of fibroblast growth factor 15 (Fgf15) in Ostα/- mice. Conclusions: Ostα-Ostβ is the major intestinal basolateral bile acid transporter, whereas Mrp3 is a back-up transporter whose function can be discerned in Ostα/- mice. Unlike a block in intestinal apical bile acid uptake, genetic ablation of basolateral bile acid influx mediated by Ostα-Ostβ disrupts the normal homeostatic control of hepatic bile acid biosynthesis.

CHOLANGIOCYTE CILIÀ EXPRESS THE OSMOSENSORY PROTEIN TRPV4 AND DETECT CHANGES IN LUMINAL BICARBONATE SECRETION

Sergio A. Gradilone, Anatoliy I. Masyuk, Patrick L. Splinter, Bing Q. Huang, Pamela S. Tietz, Jesus M. Banales, Tatyana V. Masyuk, Nicholas F. LaRusso; Internal Medicine, Mayo Clinic College of Medicine, Rochester, MN

We reported that cholangiocyte cilia are sensory organelles that respond to luminal fluid flow by changes in [Ca2+]i and cAMP. Since cholangiocyte cilia are also positioned to detect changes in luminal bile composition, we hypothesized that these organelles function as osmosensors via TRPV4, a Ca2+-permeable ion channel implicated in Ca2+ signal transduction of osmotic stimuli. Using freshly isolated rat cholangiocytes and normal mouse (NMC) and rat (NRC) cholangiocyte cell lines, we found by PCR and immunoblotting that TRPV4 message and protein are expressed in cholangiocytes. Transmission electron and immunofluorescent confocal microscopy showed that TRPV4 localizes mainly on cholangiocyte cilia. Functional studies showed that fura-2 preloaded wild type NMCs responded to hypotonicity (200 mOs/L) by a 2-fold increase in [Ca2+]i, while TRPV4-overexpressing NMCs showed a 6-fold increase, a response that was reduced (P<0.05) when NMCs were cotransfected with a shRNA to trpv-4 or exposed to Ca2+-free media. Using microperfused isolated bile duct units (IBDUs) preloaded with the calcium sensitive dye, fluo4, we observed that a decrease in perfusate freshness increased [Ca2+]i by 45%; treatment of IBDUs with the deciliating agent, chloral hydrate (CHy), or a TRPV4-siRNA abolished this effect. Luminal hypotonicity of IBDUs also induced an increase in luminal pH of 0.23 unit/min, consistent with an increase in bicarbonate secretion; this effect was also abolished by treatment with a TRPV4-siRNA or CHy. To address the mechanisms involved, we found that hypotonicity induced an increase in ATP release in wild type and TRPV4-overexpressing NMCs (5- and 7-fold, respectively); this effect was impaired when cells treated with CHy or cotransfected with a shRNA to trpv-4. Finally, the hypotonicity-induced increase of luminal pH in IBDUs was abolished by suramin, a purinergic receptor antagonist. In summary, TRPV4 is expressed on cholangiocyte cilia and hypotonicity induces an increase in [Ca2+]i in a TRPV4-, ciliary- and extracellular calcium-dependent manner. This osmosensation of luminal toxicity by ciliary TRPV4 involves apical ATP release and purinergic receptors and induces apical bicarbonate secretion, the main determinant of ductal bile formation. The results provide the first evidence of TRPV4 expression in primary cilia in any epithelial cell and suggest that in cholangiocytes these organelles play an important role in the regulation of ductal bile secretion via osmosensation.

DUAL OVER-EXPRESSION OF INSULIN RECEPTOR SUBSTRATE-1 AND HEPATITIS BX GENE CAUSES PRE-MALIGNANT CHANGES IN LIVER

Lisa Longato1, Suzanne de la Monte1, Noriyoshi Kuzushita1, Masayoshi Horimoto1, Betty Slagle2, Arlin Rogers3, Jack R. Wands1; 1Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI; 2The Baylor College of Medicine, Houston, TX; 3Massachusetts Institute of Technology, Cambridge, MA

Background: The cellular changes that contribute to the development of hepatocellular carcinoma (HCC) are poorly understood. Activation of the IN/IRS-1/Ras/Raf/MAPK and the Wnt Frizzled/β-catenin signaling cascades is frequent in HCC related to persistent hepatitis B viral (HBV) and hepatitis C viral (HCV) infection. The aims of this study were to recapitulate these findings in an animal model system by providing a proliferative stimulus via IRS-1 in the context of HBx protein overexpression in transgenic mice. The purpose was to determine if alteration in these genes is sufficient to produce dysplasia and cellular transformation in the normal liver. Methods: We generated transgenic mice in which the HBx (ATX; N=16), IRS-1 (N=15) or both (ATX+/-IRS-1+; N=23) genes were over-expressed under a liver specific promoter. Wild-type litter mates were included as controls (N=11). We also assessed oxidative damage as well as upregulation of signaling molecules related to these signal transduction cascades in the liver by "real-time" RT-PCR. Histologic analysis included an assessment of lobular and periporal inflammation, macro and microsteatosis, polyploidy, dysplasia and tumor formation. Results: ATX+/IRS-1+ double transgenic livers had increased frequency of hepatocellular dysplasia and several developed HCC (N = 3). IRS-1+ and ATX+/IRS-1+ livers had more extensive hepatic steatosis compared to the other groups. All three transgenic lines had significantly increased IRS-1, IGFB1, proliferating nuclear cell antigen, Wnt 1 and Wnt 3 mRNA levels, and increased immunoreactivity for 8-OHdG and HNE indicative of DNA damage and oxidative stress. The ATX+/IRS+ double transgenic mice were distinguished by having the highest level of activation of Wnt 3 and Frizzled 7 and selectively increased expression of IGFB-1 and asparaginyl-(asparaginyl)-β-hydroxylase (AAH) a downstream insulin responsive gene associated with increased cell motility and migration. Conclusions: These results suggest that over-expression of HBx or IRS-1 can contribute to hepatocyte transformation by promoting cell turnover and DNA damage but these effects are not sufficient to trigger neoplastic changes in the liver. However, chronic over-expression of HBx together with IRS-1 is sufficient to cause hepatocellular dysplasia and HCC in vivo suggesting that upregulation of both the IN/IRS-1/MAPK and Wnt/β-catenin signaling cascades are important in the transformation of normal hepatocytes to the malignant phenotype.

88 DISTINCT EFFECTS OF RAGE & MYD88 SIGNALING IN MASSIVE HEPATECTOMY

Shan Zeng, Hao Dun, Nikalesh Ippagunta, Rosa H Rosaria, Ann Marie Schmidt, Jean C Emond; Division of Liver Diseases and Transplantation, Department of Surgery, College of Physicians & Surgeons, Columbia University, New York, NY; Division of Surgical Science, Department of Surgery, College of Physicians & Surgeons, Columbia University, New York, NY

BACKGROUND: Our previous studies elucidated that pharmacological blockade of RAGE in a murine model of massive hepatectomy (MH) was beneficial in reducing mortality and facilitating liver regeneration. A principal site of RAGE expression in the MH liver remnant was the CD11c+ expressing dendritic cells (DC). HMBG-1 is one of RAGE ligands and triggers cellular signals through RAGE, and possibly toll like receptors (TLRs). Here, we dissected the contribution of RAGE vs Myd88 in massive liver injury by using WT, RAGE null and Myd88 null mice. METHODS: Massive liver injury (85% hepatectomy) was performed in male C57BL/6 (WT), RAGE null mice or Myd88 null mice. Liver DCs were isolated from non-parenchymal cells by density centrifugation and CD11c+ selection. RESULTS: Up-regulation of HMBG1, TLR4 and RAGE was observed in the liver remnants after MH at 6 hrs by immunoblot. Real-time PCR revealed that RAGE and TLR4 transcripts were mainly expressed in non-parenchymal cells, especially in liver DC, and to a lesser extent in kuffer cells. Liver DCs retrieved from WT mice stimulated with LPS (100 ng/ml) for 6 hrs displayed release of HMBG1 into the supernatant, but not in total cell lysate (2 fold increase vs PBS). WT DC mediated up-regulation of TNF-alpha and IL6 transcripts when exposed to LPS (100 ng/ml) for 6 hrs compared with control. 6 hours after MH, liver DCs were isolated; transcripts for TNF-alpha and IL6 were increased in liver DC, but not from DC isolated from sham mice (3.0 vs 1.0 and 3.3 vs 1.0 fold increase, respectively, p<0.05). After MH, RAGE null mice demonstrated markedly improved survival vs WT within the first 15 hrs, while Myd88 null mice were rescued with 2.5 fold increase in survival rate compared with MH during this time period. To determine the underlying mechanisms, we assessed level of activated caspase-3, c-jun, NF-kB and TUNEL positive cells in the remnants post MH. Decreased expression of activated caspase 3, nuclear NF-kB, and TUNEL positive cells were noted in RAGE null mice and Myd88 null remnants compared to WT mice at 6 hours after MH. Up-regulation of phospho-stat3 and down-regulation of c-jun was observed in RAGE null remnants compared with WT whereas, in Myd88 null mice, phospho-stat3 signaling was dramatically suppressed vs WT, but phosph-Akt was up regulated compared with WT or RAGE null mice. CONCLUSION: These findings suggest that both RAGE and Myd88 stimulate remnants cell death after MH, but that activation of distinct signaling pathways by these molecules triggers strikingly diverse effects on pro-regenerative pathways. Blockade of RAGE, but not Myd88 signaling, may exert dramatic pro-regenerative survival mechanisms early after MH.

89 ACUTE LIVER INJURY UPREGULATES MICRONRNA-491 IN MICE, AND ITS OVERexpression IN HEP G2 CELLS CAUSES APOPTOSIS

Sangjeong Yoon, Ping Guo Liu, Jian Wu, Mark A. Zern, Senthil K. Venugopal; Internal Medicine, UC Davis Medical Center, Sacramento, CA

BACKGROUND: Exposure of hepatocytes to various insults leads to apoptosis and liver injury. microRNAs (miRNAs) have emerged as novel genetic regulators of cell functions such as proliferation, apoptosis and cancer. Hence, the aim of the study is to evaluate the role of miRNAs in promoting apoptosis during liver injury. METHODS: C57BL/6 mice were administered Jo2 antibodies (0 or 10 mg/kg/mouse), and the mice were euthanized after 48 hours. The liver tissue was isolated and total RNA was isolated using miRNA isolation reagent followed by purification of <40 nucleotide RNAs using FlashPAGE gels. These purified miRNAs were labeled with Alexafluor 555 and hybridized with Ambion’s mirVana miRNA bioarrays, and scanned using the Genepix 4000B scanner. To evaluate the role of miRNAs in inducing apoptosis, Hep G2 cells were transfected with either miRNA precursors or nonspecific miRNAs. The cells were sensitized with either TNF-alpha (1ng/ml) or Fas ligand (FasL) (1ng/ml) and apoptosis was assessed by caspase-3 activity and DAPI staining. RESULTS: Administration of Jo2 antibodies caused the enhanced expression of several microRNAs in the liver. One of the species, microRNA-491 (miR-491), was upregulated 6-fold in Jo2-treated mice. These results were confirmed by stem-loop real-time RT-PCR (SLqPCR), using the Taqman miRNA assay system. The miRNA targets for miR-491 were then determined by bioinformatics. Major targets included hsp90, alpha-fetoprotein (AFP) and IKB kinase. The functional role of these targets is suggested that miR-491 might enhance apoptosis via inhibiting their expression. Therefore, Hep G2 cells were transfected with either the precursor miR-491 or nonspecific miRNA. There was a 1700-fold increase in miR-491 levels in the transfected cells in comparison to controls as assayed by the S lagPCR system. With transfection of miR-491, there was a significant reduction (50-60% less than control) in the targets (hsp90, AFP, and IKB) as evaluated by Western blots. The miR-491 transfected Hep G2 cells showed a 2.5±0.18- or 3.0±0.26-fold increase in caspase-3 activity with TNF-alpha or FasL sensitization when compared to cells treated with TNF-alpha or FasL and nonspecific miRNA. DAPI staining also demonstrated a significant increase in apoptosis in the miR-491-transfected cells. CONCLUSION: We have found a series of miRNAs that are associated with an acute liver injury mouse model. One of these, miR-491, appears to enhance apoptosis when over-expressed in an in vitro system, apparently by inhibiting the gene expression of several cell survival proteins.

90 ROLE OF HEPATIC STELLATE CELL AND ANGIOPOIETIN ON ANGIOGENESIS DURING LIVER FIBROSIS

KOJIRO TAURA, David A. Brenner; Medicine, University of California, San Diego, La Jolla, CA

[Background] Hepatic stellate cells (HSCs) contribute to the development of liver fibrosis through production of extracellular matrix and secretion of cytokines, chemokines, and growth factors. Although cirrhosis is always accompanied by neovascularization, little is known about the role of HSCs in angiogenesis during liver fibrosis. Angiopoietins are potent
angioigenic factors interacting with endothelium-specific receptor tyrosine kinase (Tie2) on endothelial cells (ECs), but their role in vascular remodeling during liver fibrosis is unknown. [Purpose] The purpose of this study is to elucidate the role of HSCs and angiopoietins on angiogenesis during liver fibrosis. [Methods] Liver fibrosis was induced in BALB/c mice by bile duct ligation (BDL) or by injection of carbon tetrachloride (CCl4) twice a week. Vessel density around the portal triads was determined by CD31 immunohistochemistry. Expression of angiopoietins was measured by quantitative real-time PCR in whole liver and isolated cell fractions. A human HSC cell line immortalized by expression of human telomerase reverse transcriptase (hTERT-HSC) was utilized to evaluate transcriptional regulation of angiopoietin-1 expression. Ad S-Tie2, an adenovirus expressing a soluble form of Tie2, was used to block angiopoietin signaling in vivo. [Results] CD31 positive area was increased around the portal triads in fibrotic livers induced by BDL (0.26% to 0.60% at 2 weeks) or by CCl4 (0.26% to 0.62% at 2 weeks). Messenger RNA expression of angiopoietin-1 was upregulated after both BDL (2.8 fold) and CCl4 (3.1 fold). Kupffer cells, ECs, and HSCs express 5, 26, and 379 times as much angiopoietin-1 mRNA as hepatocytes, respectively, indicating HSCs are the main source of angiopoietin-1 in the liver. TNFα (10 ng/ml) induced a 10-fold increase in angiopoietin-1 mRNA expression in hTERT-HSCs, and the induction was blocked by a proteasome inhibitor MG-132, an IκB kinase inhibitor PS-1145, or an adenovirus expressing the IκB superrepressor, indicating induction of angiopoietin-1 expression is NF-κB dependent. The soluble form of Tie2 was detectable in the mouse serum through 10 days after Ad S-Tie2 injection. Blockade of angiopoietin signaling in mice by Ad S-Tie2 injection prior to induction of liver fibrosis inhibited the increase in vessel density (0.44% vs 0.57% CD31-positive area) and the development of liver fibrosis (0.47% vs 1.13% sirius red-positive area) at 2 weeks after CCl4. [Conclusion] HSCs produce an angiogenic cytokine angiopoietin-1 that contributes to the development of liver fibrosis through promotion of angiogenesis. Anti-angiogenic drugs may be effective in treating hepatic fibrosis.

91 INTERIM RESULTS OF RANDOMIZED CONTROLLED TRIAL OF ELAD™ IN ACUTE ON CHRONIC LIVER DISEASE
Zhong-ping Duan3, Jing Zhang3, Shaojie Xin4, Ju Mei Chen4, Dar He2, John D. Brotherton2, Kameron Maxwell2, Michael Millis1; 1Transplantation, University of Chicago, Chicago, IL; 2Vital Therapies, Inc, San Diego, IL; 3Beijing Youan Hospital, Beijing, China; 4302 Military Hospital, Beijing, China

This report details the first use of ELAD™ (Vital Therapies Inc, San Diego Ca, a human hepatocyte based liver assist device, in patients with acute on chronic liver disease. Methods: A randomized (2:1), open label, controlled trial of 90 patients was initiated at 2 Chinese liver disease centers. Continuous ELAD therapy was provided until recovery (43-119 hrs). Inclusion criteria were Chronic HBV or HCV with a current episode of acute decompensation. The primary endpoint was survival. 60 patients have currently been enrolled. 6 patients were not evaluable secondary to protocol violations leaving 35 treated and 19 controls to evaluate. All patients underwent one treatment of plasma exchange after randomization and obtaining baseline biochemical values. Demographic, and biochemical data is shown in the table. Results: 50 day transplant free survival was 9/19 (47%) in the controls and 30/35 (86%) in the treated group (p= 0.004). 5 patients underwent transplantation in the control group vs. 2 in the treated group. Intent to treat analysis: transplant free survival 10/20 (50%) controls vs. 32/40 treated (80%) (p=0.034). Biochemical improvement supported the increased survival in the treated group. Safety endpoints: Thrombocytopenia was the only statistically significant safety issue. Platelets dropped by an average of 28% (see table) during ELAD therapy vs. no change in controls. Platelet count recovered within 5 days of ELAD discontinuation and could be managed by platelet transfusion. Conclusions: The first clinical trial of ELAD in acute on chronic liver disease patients was able to demonstrate that ELAD is safe in this patient population. There is statistically significant transplant free survival advantage for the ELAD treated patients. ELAD appears to be effective in bridging patients with acute decompensation of chronic liver disease to recovery.

92 OLDER AGE IS NOT ASSOCIATED WITH WORSE OUTCOMES IN ACUTE LIVER FAILURE
Frank V. Schiodt1,5, Raymond T. Chung2, Schilsky L. Michael5, J. Eileen Hay4, Paul Martin5, William M. Leep6, 1Dept of Hepatology A, Rigshospitalet, Copenhagen, Denmark; 2Gastrointestinal Unit, Massachusetts General Hospital, Boston, MA; 3Liver Transplantation, Weill Cornell Medical Center, New York, NY; 4Mayo Clinic, Rochester, MN; 5Mount Sinai School of Medicine, New York, NY; 6Division of Digestive and Liver Diseases, UT Southwestern Medical Center, Dallas, TX

Background: Age > 40 years is among the poor prognostic factors in King’s College Hospital criteria for acute liver failure (ALF). Older age is considered a relative contraindication for liver transplantation in ALF. We aimed to evaluate the impact of older age, defined as age ≥ 60 years, on outcomes in patients with ALF. Methods: One thousand one hundred and twenty-six patients with acute-on-chronic liver failure were enrolled in the study and were divided into two age groups, < 60 years and ≥ 60 years. Results: There was no significant difference in the causes of ALF between the age groups (p=0.78). Older age was not associated with poor outcomes in patients with ALF. There was no significant difference in the MELD score between the age groups (p=0.27) and the survival rate was not different between the age groups (p=0.21). Conclusions: Older age is not associated with worse outcomes in acute liver failure.
L-ORNITHINE PHENYLACETATE ATTENUATES INCREASE IN ARTERIAL AMMONIA AND INTRACRANIAL PRESSURE IN A DEVASCULARISED PIG MODEL OF ACUTE LIVER FAILURE: A NOVEL AMMONIA-LOWERING STRATEGY FOR HEPATIC ENCEPHALOPATHY

Lars M. Ytrebø1, Rune Gangsøy Kristiansen1, Ole Martin Fuskævåg2, Hanne Mæhre3, Arthur Revhaug4, Rajiv Jalan5, Christopher Rose6; 1Department of Anesthesiology, University Hospital of North Norway and University of Tromsø, Tromsø, Norway; 2Department of Clinical Pharmacology, University Hospital of North Norway and University of Tromsø, Tromsø, Norway; 3Department of Digestive Surgery, University Hospital of North Norway and University of Tromsø, Tromsø, Norway; 4Department of Anesthesiology, University Hospital of North Norway and University of Tromsø, Tromsø, Norway; 5Liver Failure Group, Institute of Hepatology, Division of Medicine, University College London, London, United Kingdom; 6Neuroscience Research Unit, CHUM (Hôpital SaintLuc), Montreal, QC, Canada

Ammonia is central in the pathogenesis of HE and its arterial levels predict brainstem herniation which accounts for mortality in about 30% of patients with ALF. Treatment options for hyperammonemia and raised intracranial pressure (ICP) in ALF remain unmet clinical needs. Ammonia levels in liver failure are regulated by the critical interplay of ammonia, glutamate and glutamine metabolism involving the muscle, gut and kidneys. Based on this knowledge, we have formulated L-Ornithine Phenylacetate (OP), a novel concept to reduce plasma ammonia. L-Ornithine stimulates ammonia removal through glutamine synthetase (glutamine production) in skeletal muscle and phenylacetate excretes the ornithine-related glutamine as phenylacetamide in the urine. To evaluate the therapeutic efficacy of OP, pigs with ALF (induced by liver devascularization) were treated with L-Ornithine 0.05g/kg/hr (i.v) and phenylbutyrate (pro-drug) 0.07g/kg/hr (i.g) and compared to pigs with ALF (vehicle treated) and shams. ICP and cardiovascular hemodynamics were continuously monitored for the duration of the experiment (8 hours) following liver devascularization. Arterial blood and urine was sampled every 2 hours to measure ammonia and phenylacetylglutamine respectively. A lumbar puncture cerebrospinal fluid (CSF) sample was taken at the end of the experiment to measure ammonia. Over 8 hours, arterial concentrations of ammonia did not change significantly in the sham group (50.7±8.7 µmol/L), but in the ALF group it increased to 589.6±56.7 µmol/L (p<0.001 compared to sham). This increase was attenuated in the OP-treated group (365.2±60.4 µmol/L, p<0.01 compared to ALF). Furthermore, ICP (expressed as percent baseline) did not change in the sham group (18.2±14.9%, but increased significantly in the ALF group (98.5±9.1%, p<0.01 compared to sham). In the ALF+OP-treated group, ICP was normalized (25.5±17.3%, p<0.05 compared to ALF). This was accompanied by a reduction in CSF ammonia in the ALF+OP treated pigs compared to ALF pigs (158.50±29.01 µmol/L vs 233.50±39.51 µmol/L respectively). In accordance with the hypothesis, treatment with OP resulted in increased urine phenylacetylglutamine levels in ALF+OP treated pigs compared to ALF pigs (9.0±4.5 µmol/L vs 0.05±0.04 µmol/L). In conclusion, OP is a novel approach to treat hyperammonemia and HE, which successfully attenuated an increase in arterial and CSF concentrations of ammonia and, normalized ICP in this large-animal model of ALF. These positive results demonstrating its efficacy in pigs with ALF provides the rationale for further development of this drug and a clinical trial of OP in ALF.

STARVATION-INDUCED HEPATOCYTE AUTOPHagy: AN ORIGINAL MECHANISM OF ACUTE LIVER CELL DAMAGE IN PATIENTS WITH ANOREXIA NERVAso

Pierre-Emmanuel Rautou1, Dominique Cazals-Hatem2, Richard Moreau1,3, Claire Francoz1, Gérard Feldmann2, Didier Lebrec1,3, Eric Ogier-Denis2, Dominique Valla3, Francois Durand2; 1Hepatology unit, Beaujon Hospital, Clichy, France; 2Pathology, Beaujon Hospital, Clichy, France; 3INSERM U773, Bichat Hospital, Paris, France

BACKGROUND/AIMS: In patients with anorexia nervosa (AN), increased serum transaminases level is a common finding, suggesting that extreme malnutrition, by itself, may cause some degree of liver cell damage. Yet, the mechanisms are unclear. Autophagy has been documented in patients with cardiomyopathy. This pathway can induce cell death under certain conditions. The aims of this study were to clarify the mechanisms of liver injury during AN and to determine if hepatocyte autophagy could play a role. PATIENTS/METHODS: The study is based on a series of 11 patients (9 females, 2 males) with AN referred to our institution for acute liver insufficiency between 1995 and 2007. Mean age was 24 years (range 18-47). Mean BMI was 11.4 (range 9.6-13). All the other causes of acute liver injury were ruled out. In particular, there was no paracetamol overdose. RESULTS: At admission, prothrombin
USE OF NUCLEOSIDE ANALOGUES IN HBV RELATED ACUTE LIVER FAILURE

Emmanuel Seremba1, Corron M. Sanders1, Mamta K. Jain1, Timothy J. Davern2, Lorenzo Rossaro3, Robert J. Fontana4, Steven Han5, William M. Lee; 1University of Michigan Medical Center, Ann Arbor, MI; 2University of California, San Francisco, San Francisco, CA; 3University of California, Davis, Davis, CA; 4University of California, Los Angeles, Los Angeles, CA

Background: Acute liver failure (ALF) due to hepatitis B virus [HBV] infection has a high mortality rate (~25% survival without transplant [OLT]). Recently, nucleoside analogues [NA] have been suggested to improve outcomes in severe acute hepatitis B in uncontrolled studies [Tillman HL et al. J Viral Hepat 2006;13:256]. We sought to determine whether use of NAs favorably influenced outcomes specifically in HBV ALF. Methods: Detailed clinical information had been collected prospectively on more than 1,133 patients with classically defined ALF [encephalopathy and INR > 1.5] from the ALF Study Group registry. Over the past 10 years, the ALF Study Group has enrolled 76 patients with HBV ALF. We obtained additional retrospective data from the sites on NA use for 57/76 patients: 32 had received a NA [29 lamivudine, 1 adefovir/lamivudine and 2 on entecavir]. Results: Median duration of NA use was 9 days (range 1 to 36). NA use increased only slightly over the decade, from 13/27 patients in the first 5 years of the study to 19/30 in the next 4.5 years. The groups were comparable in the following clinical and lab parameters: gender, INR, coma grade at entry and percent receiving OLT. However, the group receiving NA were older (51 vs. 38 yrs, p=0.03), and had higher bilirubin levels (23.4 mg/dl vs. 15.2, p=0.01), but lower ALT (1,234 IU/L vs. 2,416, p=0.06) and AST levels (676 vs. 1,347, p=0.03). Overall survival was 40/57 (70.1%), including 22/23 patients receiving a graft; 18/57 (31.5%) survived spontaneously (without a graft). Overall survival was 20/32 (62.5%) for the NA (14 were transplanted) and 20/25 (80%) for the no NA group (9 were transplanted), p=0.15. Spontaneous survival was 7/18 (39%) for the NA group and 11/18 (61%) for the no NA group, p=0.07. Conclusions: NA use for patients with ALF due to HBV did not appear to improve survival in this retrospective, non-randomized study. Selection bias, differences in treatment duration or other factors might be at play. Empiric use of nucleoside analogues in established HBV ALF does not appear to improve outcomes and cannot be recommended, given the trend toward worse overall and spontaneous survival in the NA group. A prospective study that evaluates NA vs placebo use for severe HBV infection and/or HBV ALF seems indicated. Supported in part by James and Alinda Wikert Fund of the Southwestern Medical Foundation and by U-01 56389 from NIDDK to WML for the ALFSG. We acknowledge the many contributions of the investigators, coordinators and patients of the Acute Liver Failure Study Group 1998-2007.

96 EVALUATION OF A SCORING SYSTEM FOR ASSESSING PROGNOSIS IN PEDIATRIC ACUTE LIVER FAILURE

Brandy Lu, Jane Gralla, Edwin Liu, Emily Dobyns, Michael Narkewicz, Ronald Sokol; Pediatrics, The University of Colorado School of Medicine and the Children's Hospital, Denver, CO

Pediatric acute liver failure (PALF) is defined as sudden severe liver dysfunction and coagulopathy with or without encephalopathy in a child without known liver disease. PALF leads to death or liver transplantation [LT] in up to 50% of cases. A scoring system for predicting death or LT in PALF [Liver Injury Units [LIU] score] was previously developed by our group [J Hepatol. 2006, 44, 134-141]. Total bilirubin, prothrombin time [PT], international normalized ratio [INR], and ammonia were identified through multi-variate analysis as significant predictors. The following formula predicted outcome: LIU = 3.507 x peak total bilirubin (mg/dl) + 45.51 x peak INR + 0.254 x peak NH3 (μmol/l). The aims of this study were to test the predictive value of the LIU score using peak values and LIU score at PALF presentation in a subsequent test group of patients. Methods: Charts were reviewed and data obtained from all 53 children with PALF admitted to The Children's Hospital of Denver from 2002 – 2006. PALF was defined using standard criteria [J Pediatr. 2006, 148, 652-8]. Outcome was defined at 4 weeks as alive without LT, death, or LT. Survival curves were constructed based on the quartile of the LIU score. Individual receiver operating characteristics [ROC] curves were generated to predict death or transplant at 4 weeks following presentation. Results: Etiology of PALF was indeterminate [14], sepsis/ischemia-reperfusion [14], viral [8], metabolic [5], acetaminophen [4], hematology-oncology [4], and other [4]. 13% underwent LT, 15% died without LT, with an overall transplant-free survival of 72% at 4 weeks. The proportion of patients alive without LT was plotted in a survival analysis stratified by previously defined quartiles for the LIU score [0-209; 210-296; 297-369; > 369]. Survival without LT at 4 weeks for each quartile using the peak LIU score was 92%, 78%, 60%, and 25% respectively (p=0.0001). The Peak LIU ROC had a C index of 0.96, with a sensitivity of 96% and specificity of 88%.
86.3. The Presentation LIU score was also predictive of outcome based on survival curves (p = 0.005) with a C-index of 79.3. Conclusions: Both the Peak and Presentation LIU scores were predictive of survival without liver transplantation in this test group of PALF patients. The LIU score may be useful for establishing transplant priority in PALF and as a research tool for stratifying PALF patients into risk groups. Further prospective analysis is underway.

97 A DEDICATED FIBROSCAN® PROBE TO EVALUATE LIVER FIBROSIS IN CHILDREN: FEASIBILITY AND PERFORMANCE FOR THE DIAGNOSIS OF CIRRHOSIS
Thierry Lamireau1, Stéphanie Franchi2, Monique Fabre3, Brigitte Le Bail4, Jean-François Chatel5, Daniele Pariente6, Juliette Foucher7, Olivier Bernard2, Victor de Ledinghen2; 1Pediatry, Haut Leveque Hospital, Pessac, France; 2Pediatric Radiology, Bicetre Hospital, Le Kremlin Bicetre, France; 3Pathology, Bicetre Hospital, Le Kremlin Bicetre, France; 4Pathology, Haut Leveque Hospital, Pessac, France; 5Pediatric Radiology, Haut Leveque Hospital, Le Kremlin Bicetre, France; 6Pediatric Gastroenterology, Haut Leveque Hospital, Pessac, France; 7Pediatric Hepato Gastroenterology, Bicetre Hospital, Le Kremlin Bicetre, France

Liver stiffness measurement (LSM) has been shown to be correlated with liver fibrosis in adult with chronic liver disease. A preliminary study using the standard FibroScan® probe showed promising results after data were reprocessed [1] and led to the development of a probe dedicated to children. The aim of this prospective study was to evaluate the performance of this FibroScan® probe dedicated to children. From December 2005 to October 2006, all consecutive children with chronic liver diseases were enrolled after informed consent was obtained from their parents. Clinical, biological, US examination and eventually liver biopsy (LB) were performed. Liver stiffness was assessed using the METAVIR scoring system by two pathologists. Liver stiffness measurement was performed using FibroScan® (EchoSens, Paris, France) equipped with a probe dedicated to children. Examination was considered as reliable if at least 5 valid measurements were obtained. 93 children were included and LSM was unreliable in 3 patients. In the 90 children remaining (46 boys), age was 88 ± 64 [1-206] months and BMI 16.6 ± 10.4-24.2 kg/m². Etiologies were 22 biliary atresia, 7 HCV, 6 HBV, 10 autoimmune hepatitis and 45 miscellaneous. LSM was significantly (p < 0.05) correlated with platelets (-0.46), prothrombin time (-0.30), INR (0.33), albumin (-0.47), bilirubin (0.50), AST (0.44), ALT (0.34), GGT (0.37), alkaline phosphatases (0.22) and hyalurionate (0.38). US signs of portal hypertension were significantly associated with higher LSM (19.5 ± 18.1 versus 6.6 ± 3.8 kPa). Out of 56 LB, 11 were unreliable for fibrosis staging (METAIVR). Between LSM and METAIVIR fibrosis stage, Kendall correlation coefficient was 0.42 (p < 0.001). Area under the ROC curve was 0.88 (0.65-0.96) for the diagnosis of cirrhosis. Reliable liver stiffness measurement was feasible using a dedicated probe in children from 18 years down to 1 month of age. Moreover, LSM was strongly correlated with liver fibrosis assessed by histology, biological parameters and the presence of portal hypertension. This new probe needs to be rapidly available for further studies in large cohorts of children with and without cirrhosis. [1] de Ledinghen et al, JPGH (in press)

98 OVERWEIGHT IS ASSOCIATED WITH DIMINISHED ANTIVIRAL RESPONSE IN HCV-INFECTED CHILDREN
Aymin Delgado-Borrego1,2, Marielle Christofe2, David Healey3, David A. Ludwig1, Maureen M. Jonas2,4, Raymond T. Chung1,4; 1Pediatrics, University of Miami, Miami, Fl; 2Medicine/ GI and Nutrition, Children’s Hospital Boston, Boston, MA; 3Medicine/ GI, Massachusetts General Hospital, Boston, MA; 4Harvard University, Boston, MA

Background and Aims: Evidence demonstrates that obesity is associated with poor response to interferon therapy among hepatitis C (HCV)-infected adults. However, this evidence is confounded by the use of a single adult dose rather than weight-based dosing of interferon whereby overweight patients most often received lower doses relative to their body mass. Pediatric cohorts offer advantages over adult populations, including lower degrees of fibrosis, minimal comorbidities, and, in general, shorter duration of infection. The aim of this investigation was to determine the effect of overweight on response to antiviral therapy for HCV in the young. Methods: Patients younger than 20 years of age (median= 13.1, range= 5.9-19.2), who received therapy for HCV infection at Children’s Hospital Boston (CHB) between 1998 and 2007 (n=45) were included. Demographic characteristics, medical histories, HCV genotype, available liver histology, anthropometric measurements before and after treatment, and response to therapy (defined as HCV RNA levels below the limit of detection at the end of therapy) were analyzed. Treatment included at least 12 weeks of therapy with standard interferon with and without ribavirin; dosages of all medications were determined based on subjects' body weight. Subjects' BMI percentiles and subsequent z scores were calculated from CDC smoothed percentile curves of the NHANES data. Results: There were 21 males and 24 females in the study. The vast majority of patients were non-Hispanic Caucasian; there was one African American and 3 Hispanics. Most patients had mild to no fibrosis at the onset of treatment. Thirty-five had genotype 1, six had genotype 3a, three had genotype 2a, and one had genotype 4. A multiple logistic regression model controlling for change in BMI z-score demonstrated a significant association between baseline BMI z-score and response to antiviral therapy (OR=0.50; 95% CI 0.26-0.94; p=0.03). In the same model, overweight patients (BMI>85 percentile for age and gender) at onset of therapy had 85% lower odds of response to antiviral therapy (OR=0.15; 95% CI 0.03-0.69; p=0.02). Conclusion: Overweight is independently associated with poor response to antiviral therapy against HCV among children and adolescents. The use of uniform weight-based dosing and choice of a pediatric cohort minimize possible confounders. These results strongly suggest that increased BMI has an intrinsically adverse effect on treatment outcome independent of possible underdosing of interferon and/or ribavirin.

HIGH THROUGHPUT SEQUENCE ANALYSIS IDENTIFIES INDIVIDUAL AND COMBINED GENETIC DEFECTS IN CHILDREN WITH SYNDROMES OF INTRAHEPATIC CHOLESTASIS

Ursula Matte, Cong Liu, Alexander Miethke, Reena Mourya, Gregory Kauffmann, Katie D. Mayer, Laura Bull, Nancy Spinner, Richard J. Thompson, Jorge Bezerra

The discovery of the genetic defects in children with intrahepatic cholestasis allows a specific diagnosis to be made despite the large overlap in clinical phenotypes. Because of the lack of predominant mutations in target genes, we developed a sequencing chip (the JaundiceChip) that reads all exons and intron boundaries of five genes known to cause syndromes of intrahepatic cholestasis: SERPA1A (for Alpha-1-Antitrypsin), A1AT, JAG1 (Alagille syndrome, AGS), ATPB81 (FIC1 deficiency), ABCB11 (BSEP deficiency), and ABCB4 (MDR3 deficiency) simultaneously. In this study, we aimed to: 1) determine the ability of the chip to detect previously reported mutations, 2) search for mutations in children with chronic cholestasis of unknown etiology, and 3) screen for the coexistence of defects in more than one gene.

Methods and Results: We tested the chip using peripheral blood DNA from 48 subjects that either had a well defined clinical/biochemical diagnosis (A1AT=10, AGS=10, MDR3=1) or carried candidate mutations previously identified by capillary sequencing (AGS=5, FIC1=11, BSEP=11). The chip accurately identified at least one candidate mutation in 38 of 48 patients (79.2%). These mutations correlated with the previously assigned clinical or molecular diagnosis in more than 90% of patients for individual diseases, except for AGS in whom mutations were detected in 7 of 15 (46.7%) subjects. Because of the known high frequency of insertion/deletion mutations in AGS, we developed a complementary capillary sequencing approach and identified potentially disease-causing mutations in 7 of the remaining 8 subjects. We then applied the JaundiceChip to screen for candidate mutations in 24 subjects with intrahepatic cholestasis of unknown etiology and without features of AGS. We found mutations in 50% of the subjects, but the mutation frequency increased to 60% in subjects with low serum GGT, all of them in the ATPB81 and ABCB11 genes. Sequence analysis of the entire cohort revealed that the previously reported ATPB81 mutations N45T and E429A were present in 21% of subjects with BSEP deficiency (harboring ABCB11 mutations) and K203R and F305I in 20% of subjects with PiZ allele. In conclusion, validation studies showed that the JaundiceChip detects candidate mutations in 79.2% of children with intrahepatic cholestasis and requires complementary capillary sequencing to detect insertions or deletions in JAG1. When used to test subjects with known and undefined forms of intrahepatic cholestasis, the JaundiceChip identifies candidate mutations in at least half of the subjects and the coexistence of previously reported mutations in more than one gene in a subgroup of subjects.

COMPARATIVE PROTEOMIC ANALYSIS OF ENTERAL NUTRITION-ASSOCIATED LIVER DISEASE (PNALD) IN INFANTS WITH INTESTINAL FAILURE

Ronald J. Sokol, Kerri Murray, Jenna Boyd, Heather Thompson, Ross Shepherd, Frederick M. Karrer, Cara Mack, Mark Duncan

Cholestatic liver disease is a serious complication of parenteral nutrition (PN) therapy in infants with intestinal failure and is the primary indication for liver-intestinal transplants in children. Because current treatments are ineffective, novel strategies are needed to discover mechanisms involved in this serious liver injury. The aim of this study was to apply comparative proteomics to determine differences in protein levels in the liver of infants with PNALD. Methods: A portion of surgical liver biopsies, obtained for clinical purposes, was flash-frozen in liquid nitrogen from 7 infants with PNALD (mean age 88 days, 5 male) and 7 with BA (BA control group) undergoing portoenterostomy (mean age 59 days, 2 male). Underlying intestinal diseases in PN group were NEC, gastrochisis, intestinal volvulus and atresias. Mean serum total bilirubin (PN:7.4, BA:7.0 mg/dl), conjugated bilirubin (6.0, 5.3), ALT (305, 129 IU/L) and alkaline phosphatase (707, 647 IU/L) did not differ between the two groups. Liver was homogenized, proteins precipitated with methanol/chloroform, and difference gel electrophoresis (DIGE) was used to compare protein levels in PNALD and BA samples (n=7 separate gels). Differentially abundant spots were excised, digested with trypsin, analyzed by MALDI-TOF MS and identified based on their peptide mass fingerprints. Results: Over 2000 protein spots were detected on each gel and 96 of the differentially abundant spots were identified by mass spectrometry. Stringent criteria were employed to establish a subset of 4 proteins of interest that were significantly overabundant in all PNALD samples compared to BA samples: peroxiredoxin-2, protein S100-A8, glutathione S-transferase P, and Mn-superoxide dismutase (mitochondrial SOD). Notably, each of these are involved in redox regulation and cellular protection against oxidative stress, a proposed mechanism involved in PNALD (Am J Physiol 1996;270:G691). Of note, lipid peroxide products (lipofovin) in Kupffer cells are characteristic of PNALD liver histology. Two overabundant proteins in BA were peroxiredoxin-2 and protein S100-A8; the latter is expressed by macrophages which have been shown to be increased in the portal tracts in BA. These findings were validated with immunoblotting. Conclusion: Comparative proteomics identified several over abundant proteins in PNALD to be key redox regulators, supporting the proposal that oxidative stress is a major pathway of tissue injury in PNALD. These findings raise the possibility that novel therapeutic approaches for this disease could be targeted at this pathway.

HCV-SPECIFIC PRODUCTION OF IL-10 AND IFN-GAMMA-INDUCIBLE PROTEIN-10 (IP-10) LEVELS PREDICT TREATMENT RESPONSE TO PEGYLATED INTERFERON AND RIBAVIRIN IN CHILDREN WITH CHRONIC HEPATITIS C INFECTION

Ivana Carey, Maria Mytilinaiou, Munther Hussain, Sanjay Bansal, Pushpa Subramaniam, Mary Horner, Maria Serena Longhi, Francesca Meda, Giorgina Mieli-Vergani, Diego Vergani

Background: Chronic hepatitis C virus (HCV) infection in children manifests as slowly progressing mild disease in the first two decades with potentially severe acceleration in adulthood. In adults antiviral therapy with pegylated interferon (IFN) and ribavirin prevents disease progression, while successful control of HCV infection is associated with strong and broad HCV-specific immune reactivity of Th helper 1 (Th1) type lymphocytes. Pre-treatment plasma levels of the chemokine IFN-gamma-inducible protein-10 (IP-10) were suggested to predict response to therapy. Limited information is available on HCV-specific immune reactivity in childhood. Aim: To investigate whether baseline HCV-specific Th1/Th2 immune responses and plasma levels of IP-10 predict outcome of therapy with pegylated IFN and ribavirin in children with chronic hepatitis C. Patients: Eighteen children (9 males, median age 13.5 years) with perinatally acquired chronic hepatitis C were treated with pegylated IFN and ribavirin. Patients were divided into two groups according to treatment response: 14 responders (R) and 4 non-responders (NR). Five HBV-infected children (4 males, median age 14.2 years) served as controls. Methods: Th1/Th2 lymphocyte HCV-specific responses were evaluated by IFN-gamma and interleukin-10 (IL-10) Elispots in peripheral blood mononuclear cells (PBMC) after stimulation with genotype specific HCV antigens (core, NS3, NS4 and NS5). The non-specific stimuli phytohemagglutinin, bacterial lipopolysacharide and tetanus toxoid antigen served as positive controls. Plasma IP-10 concentrations were measured by ELISA. Results: Baseline HCV-specific IFN-gamma production was similar in R and NR. In contrast, core- and NS3-specific IL-10 production was higher in NR than in R (core: 76.3 ± 23.9 vs. 12.5 ± 6.2 specific spot forming cells (SPF) per million of PBMC (spSFC/10^6 PBMC), p=0.008 and NS3: 81.3 ± 16.8 vs. 27.5 ± 10.1 spSFC/10^6 PBMC, p=0.03). Production of IFN-gamma and IL-10 was similar in R and NR after stimulation with non-specific stimuli. Low HCV-specific IFN-gamma and IL-10 production was detected in HBV infected children (IFN-gamma HCV core: 7.5 ± 3.4 spSFC/10^6 PBMC and IL-10 HCV core: 7.9 ± 3.7 spSFC/10^6 PBMC). Plasma levels of IP-10 tended to be higher in NR (57.0 ± 12.8 vs. 31.4 ± 9.7 pg/ml, p=0.15). Conclusions: High levels of pre-treatment IP-10 and HCV specific production of IL-10 are associated with failure to respond to antiviral treatment in children with chronic HCV infection.

DISCRIMINATING FEATURES OF BILARY ATRESIA - A PROSPECTIVE MULTI-CENTERED ANALYSIS

Benjamin Shneider1, Ross Shepherd2, John Magee3, John C. Bucuvalas4, Barbara Haber5, Saul J. Karpen6, Phil Rosenthal7, Kathleen B. Schwarz8, Frederick J. Suchy9, Peter F. Whittington10, Ronald J. Sokol11, C. For Bar2; 1Children's Hospital Pittsburgh, Pittsburgh, PA; 2Washington University, St. Louis, MO; 3University of Michigan, Ann Arbor, MI; 4Cincinnati Children's Medical Center, Cincinnati, OH; 5Children's Hospital of Philadelphia, Philadelphia, PA; 6Texas Children's Hospital, Houston, TX; 7University of California San Francisco, San Francisco, CA; 8Johns Hopkins University, Baltimore, MD; 9Mount Sinai School of Medicine, New York, NY; 10Children's Memorial Hospital, Chicago, IL; 11Children's Hospital Denver, Denver, CO

Introduction: Neonatal cholestasis presents an important diagnostic challenge. Efficiently differentiating biliary atresia (BA) from other causes of cholestasis is important in order to undertake surgical intervention early when it is more effective. Identifying presenting features that effectively differentiate BA from other forms of neonatal cholestasis would contribute to an efficient diagnostic algorithm. We performed the first prospective multi-center analysis to assess the reliability of patterns of presenting features in making a diagnosis of BA. Methods: Between October 2003 and April 2007, 222 children with neonatal cholestasis were enrolled in a prospective multi-center database as part of the Biliary Atresia Research Consortium (BARC). Presenting clinical features, physical findings and laboratory data were collected prospectively and recorded prior to the ultimate assignment of a clinical diagnosis. Specific features analyzed from the time of the first evaluation at the BARC center included: age, sex, weight, height, head circumference, midarm circumference, triceps skinfold thickness, palpable liver (including cm below the costal margin), palpable spleen, acholic stools, facial features, total bilirubin, conjugated bilirubin, ALT, AST, alkaline phosphatase, GGT albumin, platelet count, and cholesterol. Findings were compared between subjects ultimately diagnosed with BA relative to all others (non-BA). Results: 106 subjects were diagnosed with BA (116 non-BA). Of the findings described above the ones that were significantly different between BA and non-BA (expressed as BA vs non-BA, mean +/- SD) were: female sex (49 vs 35%, p=0.04), measurement of liver edge below costal margin (3.4 +/- 1.7 vs. 2.6 +/- 2.0 cm, p=0.0002), normal facial features (94% vs 82%, p=0.009), palpable spleen (56% vs 38%, p=0.012), acholic stools (80% vs 31%, p<0.0001), and GGT (655 +/- 476 vs 349 +/- 376, p<0.0001). By multivariate analysis (expressed as odds ratio; 95% CI) acholic stools (8.9; 3.7 – 21.7, p<0.0001), female gender (2.3; 1.04 – 5.2, p=0.04), and GGT (1.19; 1.07 – 1.32, p=0.0015) were independent predictors of BA. Conclusion: It is difficult to distinguish BA from other cholestatic liver diseases at the time of presentation on the basis of physical findings and currently utilized routine laboratory parameters. The combination of acholic stools and elevated GGT may be the most informative findings. Supported by grants from the NIDDK, NIH

CASPASE INHIBITION SWITCHED TNF-ALPHA-INDUCED APOPTOSIS TO AUTOPHAGIC CELL DEATH IN HEPATOCYTES

Wen-Xing Ding, Hong-Min Ni, Xiaoyun Chen, Donna B. Stolz, Xiao-Ming Yin; Pathology, University of Pittsburgh, Pittsburgh, PA; 2Cell Biology and Physiology, University of Pittsburgh, Pittsburgh, PA.

Cell death, in particular, apoptosis, plays an important role in many liver diseases such as eatotoxicity and alcohol-induced liver injury. We have previously demonstrated that tumor necrosis factor-alpha (TNF) plus a general transcription inhibitor actinomycin D (ActD) induced apoptosis in primary cultured mouse hepatocytes. This apoptosis could be completely suppressed by a general caspase inhibitor, ZVAD-fmk (Ding et al Hepatology 2004;40:403-413). However, we found that in the presence of ZVAD-fmk, TNF/ActD-treated hepatocytes still died in a necrosis-like cell death with abundant cellular vacuoles, as examined by the propidium iodide (PI) staining and phase-contrast microscopy. In contrast, ZVAD-fmk alone did not induce cell death in the cultured hepatocytes. Using adenov-GFP-LC3 infected hepatocytes, we found that TNF/ActD/ZVAD-fmk treatment significantly increased the percentage of cells with punctuated GFP-LC3, a hallmark of autophagy, suggesting the activation of autophagy in TNF/ActD/ZVAD-fmk-treated hepatocytes. To further confirm the induction of autophagy by TNF/ActD/ZVAD-fmk treatment, we have performed electron microscopy (EM) studies. Results from the EM studies revealed that TNF/ActD/ZVAD-fmk-treated hepatocytes accumulated large amounts of autophagosomes (AV), while few were found in control cells, further supporting the induction of autophagy by TNF/ActD/ZVAD-fmk treatment. Interestingly, in the presence of two autophagy inhibitors, 3-methyadenine (3-MA) and LY294002, TNF/ActD/ZVAD-fmk-induced cell death was significantly suppressed. Moreover, necrostatin, a novel small molecule which has been shown to be a specific necrosis inhibitor, did not affect TNF/ActD/ZVAD-fmk-induced cell death. Taken together, these findings suggest that autophagic cell death could be induced by TNF/ActD/ZVAD-fmk in hepatocytes and imply that simply suppress caspase activity is not sufficient to fully protect hepatocytes from TNF-mediated cell death, even apoptosis is blocked.

IMPAIRED AUTOPHAGY IS THE MECHANISM OF MITOCHONDRIAL DYSFUNCTION IN ISCHEMIC RAT HEPATOCYTES

Jae-Sung Kim, Takashi Nitta, Insil Kim, John J. Lemasters, William A. Dunn, Kevin E. Behrns; 1Surgery, University of Florida, Gainesville, FL; 2Pathology, University of Florida, Gainesville, FL; 3Pharmaceutical Sciences, Medical University of South Carolina, Charleston, SC.

BACKGROUND: Onset of the mitochondrial permeability transition (MPT) after ischemia/reperfusion (I/R) is a key mitochondrial dysfunction causing hepatocyte death. Autophagy is a vital endogenous process that selectively removes abnormal or damaged cellular constituents and organelles such as dysfunctional mitochondria. Defects in autophagy cause accumulation of dysfunctional mitochondria, leading to cell death. However, the role and regulation of autophagy in ischemic hepatocytes is unknown. The AIM of this study was to investigate the role of mitochondrial autophagy in I/R-induced injury to hepatocytes. METHODS: Cultured rat hepatocytes were incubated in anoxic Krebs-Ringer-HEPES (KRH) buffer at pH 6.2 for 4 h to simulate tissue ischemia. To simulate reperfusion, cells were reoxygenated at pH 7.4 for 2 h. Expressions of Akt7 and Beclin-1, proteins that regulate autophagy, were analyzed by Western blot during I/R. Some hepatocytes were incubated with 50 μM of N-Acetyl-Leu-Leu-Met-CHO to block calpains, or transfected with adenoviruses encoding GFP (control), Akt7 and Beclin-1 to augment autophagy. To induce nutrient depletion, a condition that stimulates autophagy, hepatocytes were incubated in KRH for 3 h prior to onset of ischemia. Necrotic cell death was evaluated by propidium iodide (PI) fluorometry. For confocal imaging, hepatocytes were co-loaded with calcine, tetramethylrhodamine methylster and PI to visualize onset of the MPT, mitochondrial depolarization and necrosis, respectively. To further examine the role of autophagy, hepatocytes were isolated from GFP-LC3 mouse or rat hepatocytes were transfected with adenovirus expressing GFP-LC3 and subjected to I/R. Confocal images were collected to analyze green fluorescent autophagosomes (GFP-LC3) during and after ischemia.

RESULTS: Western blot analysis showed that 4 h of ischemia decreased Akt7 and Beclin-1 to 8.1% and 48.9% of normal values, respectively. After 20 min of reperfusion, expressions of Akt7 and Beclin-1 further decreased to only 0.9% and 8.9% of initial values, respectively. In control hepatocytes, reperfusion caused MPT-dependent necrotic cell death. However, calpain inhibition, adenoviral overexpression and nutrient depletion all substantially suppressed I/R-induced loss of autophagy proteins, and furthermore prevented onset of the MPT and cell death after reperfusion. Confocal imaging of GFP-LC3 confirmed I/R-induced depletion of autophagosomes, which was reversed by adenoviral overexpression and nutrient depletion.

CONCLUSION: Degradation of Akt7 and Beclin-1 by calpains impairs mitochondrial autophagy, which in turn leads to MPT-dependent hepatocyte death after I/R.

CASPASE 8-INDUCED ENDOSONAL ACIDIFICATION IS AN UPSTREAM EVENT IN CD95-DEPENDENT HEPATOCYTE APOPTOSIS

Roland Reinehr, Stephan Becker, Annika Sommerfeld, Susanne Grether-Beck, Dieter Haussinger; 1Gastroenterology, Hepatology and Infectiology, University Hospital Düsseldorf, Düsseldorf, Germany; 2Institut fuer Umweltmedizinische Forschung (IFU), Heinrich-Heine-University Düsseldorf, Düsseldorf, Germany.

Introduction: In hepatocytes, almost all CD95 receptor is located inside the cell. CD95 ligand (CD95L) was recently shown to trigger a NADPH oxidase-derived generation of reactive oxygen species (ROS) through a ceramide-dependent pathway which finally leads to CD95 trafficking to the plasma membrane (Reinehr et al., J Biol Chem 2005). Methods: In primary rat hepatocytes and hepatocytes from p47phox knock-out mice ceramide formation was detected by HPTLC and ROS generation by DCFDA-fluorescence. Apparent vesicular pH was determined using endocytosed FITC-dextran and [3Cl-]cyt by MQAE-fluorescence. Acidic sphingomyelinase (ASM) protein knock-down was achieved using antisense oligonucleotides. Activation of the CD95 system was measured by CD95 immunoprecipitation and subsequent detection for EGFR-FADD- and caspase 8-association and CD95-yr phosphorylation by WBlot. CD95 trafficking to the plasma membrane was visualized by immunocytchemistry under permeabilized vs.
non-permeabilized conditions. Results: CD95L lowered within seconds the apparent vesicular pH from 6.0 to 5.7 in a FITC-dextran-accessible and ASM-containing endosomal compartment, which activates ASM-driven ceramide formation. Simultaneously, an increase of [Cl\textsuperscript{-}]-cyt was observed, which is known to activate vH\textsuperscript{+}-ATPase. Inhibition of CD95L-induced endosomal acidification by either bafilomycin or DIDS largely abolished the CD95L-induced ceramide-formation as well as downstream processes, such as p47phox-Ser phosphorylation, ROS generation, activation of the CD95 system and subsequent apoptosis. These responses were also abolished after protein knock-down of ASM in rat hepatocytes or in cells from the p47phox knock-out mouse. In addition, inhibition of caspase 8 using a caspase 8- or a pan-caspase-inhibitor abolished both, signaling events occurring almost instantaneously after CD95L-addition including increase in [Cl\textsuperscript{-}]-cyt, endosomal acidification, ceramide- and ROS-generation, as well as the subsequent activation of the CD95 system by EGFR-catalyzed CD95-Tyr phosphorylation, translocation of the intracellular located main amount of CD95 to the plasma membrane and DISC-formation. Conclusions: These data suggest that in hepatocytes some CD95 “sentinel” receptors, which are undetectable by conventional immunostaining, are present at the plasma membrane under control conditions and which after CD95L-addition, induce an instantaneous and caspase 8-dependent increase in [Cl\textsuperscript{-}]-cyt, endosomal acidification and ROS generation. This further leads to a self-amplification of the CD95 death receptor-pathway by trafficking of the main amount and intracellular localized CD95 receptors to the plasma membrane.

106 INTERNALIZATION OF DEATH RECEPTOR 5 IS REQUI-SITE FOR LYOSOMAL PERMEABILIZATION BY TRAIL

Yuko Akazawa, Steven F. Bronk, Nathan W. Werneburg, Justin L. Mott, M. Eugenia Guicciardi, Xue W. Meng, Mark A. McNiven, Vijay Shah, Gregory Gores; Mayo Clinic College of Medicine, Rochester, MN

Tumor necrosis factor-related apoptosis inducing ligand (TRAIL) selectively triggers cell death in a wide variety of cancer cells through two death receptors, death receptor 4 (DR4) and death receptor 5 (DR5). We have recently reported that TRAIL cytotoxicity is mediated by lysosomal permeabilization (Guicciardi et al Am J Physiol, in press). However, the mechanisms responsible for TRAIL-induced lysosomal permeabilization remain unclear. Our AIM was to determine which death receptor, DR5 and/or DR4 mediates TRAIL-induced lysosomal permeabilization, and to ascertain if receptor internalization is necessary for this process. METHODS: Apoptosis was induced by treating HUH-7 cells, a human hepatocellular carcinoma cell line, with TRAIL. DR4 and DR5 were knocked down by siRNA technology. Internalization of TRAIL:TRAIL receptor complex was analyzed by confocal microscopy using Flag-tagged TRAIL. Clathrin-dependent endocytosis was inhibited by infecting cells with an adenovirus expressing the K44A dominant negative dynamin mutant. Lysosomal permeabilization was evaluated by examining the subcellular localization of cathepsin B, a lysosomal protease, by immunofluorescence. Apoptosis was assessed by characteristic nuclear staining with DAPI and caspase 3/7 activity assay. RESULTS: HUH-7 cells express both TRAIL receptors. Confirmation of selective DR4 or DR5 knockdown by specific siRNA was confirmed by immunoblot analysis. DR5 siRNA, but not DR4 siRNA significantly attenuated TRAIL-mediated apoptosis (p<0.05). DR5 siRNA also reduced cathepsin B release from lysosomes (p<0.0001), indicating that DR5 specifically mediates lysosomal release of this protease. Flag-tagged TRAIL was internalized into cytosol within 60 minutes after administration of TRAIL. TRAIL-mediated apoptosis was significantly reduced in K44A dynamin adenovirus-infected cells as assessed by both morphologic changes and caspase 3/7 activity (p<0.05). In addition, K44A dynamin adenovirus infection also reduced lysosomal permeabilization (p<0.0001). CONCLUSIONS: Our results indicate that DR5 mediates TRAIL-triggered lysosomal permeabilization. Moreover, internalization of the TRAIL:DR5 receptor complex is requisite for lysosomal permeabilization. We speculate that internalization of the receptor-ligand complex targets apoptosis effectors to lysosomes triggering this death pathway.

107 GLUTATHIONE DEPLETION DOWN-REGULATES TUMOR NECROSIS FACTOR (TNF) α-INDUCED NF-κB ACTIVITY VIA IκB KINASE (IKK)-INDEPENDENT AND -DEPENDENT MECHANISMS

Huan Lou, Neil Kaplowitz; Medicine, University of Southern California, Los Angeles, CA

Background and Aim: Depletion of reduced glutathione (GSH) by diethyl meleate (DEM) was shown previously to inhibit expression of NF-κB target genes induced by TNF and sensitize primary cultured mouse hepatocytes to TNF-mediated apoptotic killing. The present studies were designed to elucidate the mechanism for the inhibitory effect of GSH depletion on this pathway and to compare the effects of moderate versus severe GSH depletion. Methods: Hepatocytes were isolated from male C57BL/6 mice, 7-9 week of age, plated at 1.2x10\textsuperscript{6} cell/60-mm dish. Total glutathione levels were determined by recycling assay. Western blotting (WB) analysis and quantitative real-time PCR were used to assess protein and mRNA levels. Electrophoretic mobility shift assay and chromatin immunoprecipitation assay were used to examine NF-κB DNA binding activity in vitro and in intact cells, respectively. Results: We observed that moderately depleting cell of GSH (~50%) by 0.1 mM DEM cotreatment (1) represses expression of NF-κB responsive gene in a xB-site dependent manner using reporter gene assays, (2) inhibits TNF-induced expression of endogenous NF-κB-target genes, including IκBα, A20, cIAP1, iNOS, and FUIPL, at both mRNA and protein levels, and (3) sensitizes PMH to TNF-induced apoptosis. Similar results were obtained when moderate GSH depletion was achieved by inhibition of GSH synthesis with buthionine-sulfoximine. However, TNF-induced IκK activation, IκBα degradation, NF-κB nuclear translocation, NF-κB DNA binding in vitro or p65-DNA binding in vivo were not altered, indicating the down-regulation is independent of the IKK-IκK-pathway and suggesting repression of NF-κB transcriptional activity. On the other hand, severely depleting cell GSH (~80%) by 0.5 mM DEM results in partial blockage of TNF-induced nuclear translocation of NF-κB. Interestingly, a decrease of polyubiquitinated RIP1 in TNF-engaged TNFRI signaling complex was found under this condition, which preceded the decrease in activating phosphorylation of IKK and subsequent decrease in IκK activity, IκBα phosphorylation and degradation. Importantly, pretreatment with antioxidant trolox protects against the inhibitory effect of profound GSH depletion on IκK activation and NF-κB nuclear translocation but fails to restore expression of NF-κB target genes.
unmasking the repression of nuclear NF-κB activity. Conclusions: Down-regulation of TNF-induced NF-κB transactivation by moderate GSH depletion (~50%) is IKK-independent and acts on NF-κB transcriptional activity in nucleus, whereas with profound GSH depletion (~80%) the inhibition extends to IKK-pathway activation in a reactive oxygen species dependent manner.

108 ACTIVATION OF FOCAL ADHESION KINASE AND JNK CONTRIBUTES TO THE EXTRACELLULAR MATRIX MEDIATED DIFFERENTIAL SENSITIVITY TO BILE ACID INDUCED APOPTOSIS IN RAT HEPATOCYTES

Paul Usechak, Anna Gates, Cynthia R. Webster; Clinical Science, Tufts Cummings School of Veterinary Medicine, N Grafton, MA, MA

The extracellular matrix modules cell survival. Hepatocytes plated on polylysine (PL) or laminin (LM) undergo more bile acid induced apoptosis than cells plated on type I collagen (CL). Bile acids activate the pro-apoptotic kinase, JNK. Focal adhesion kinase (FAK) which is phosphorylated by integrin engagement modulates extracellular matrix mediated survival in non-hepatic cells. Aim: The goal was to study the role of JNK and FAK in the extracellular matrix mediated differential susceptibility of hepatocytes to bile acid apoptosis. Methods: Rat hepatocytes were plated on CL and LM, which engage integrins, or on PL which promotes nonspecific binding. Kinase activation by glycochenodeoxycholate (GCDC, 50 μM) was determined by immunoblotting for the phosphorylated form of JNK-T183/Y185, and Fak-Y397. Apoptosis was determined morphologically by Hoechst staining of cells treated with GCDC (50 μM) or deoxycholate (100 μM) in the presence or absence of cytochalasin B, 1 μM (a concentration that inhibits FAK but not actin polymerization) or the JNK inhibitor, SP-600125, 5 μM. Results: Compared to hepatocytes on CL, cells on LM and PL had more apoptosis in response to GCDC (1.6 and 1.4 fold, respectively) and DCA (1.3 and 1.9 fold, respectively). In hepatocytes on CL, GCDC increased phosphorylation of JNK p56 and p46, 1.8 and 1.7 fold respectively at 60’, while hepatocytes plated on PL or LM had 58 and 14 fold increases in JNK p56 phosphorylation and 13 and 27 fold increases in JNK p46 phosphorylation, respectively. SP-600125 prevented LM and PL potentiation of DCA induced apoptosis suggesting that JNK activation was pro-apoptotic. An anti-apoptotic role for FAK is supported by the following observations: 1) basal FAK phosphorylation decreased 30 to 40% in hepatocytes on LM and PL compared to hepatocytes on CL; 2) cytochalasin treatment which decreased FAK phosphorylation in hepatocytes on CL increased GCDC induced apoptosis 60 +/- 6.7 % resulting in an amount similar to that seen in cells on PL and LM; 3) GCDC treatment decreased FAK phosphorylation in hepatocytes plated on CL (by contrast 50 μM of the nontoxic bile acid tauroursodeoxycholate had no effect on FAK); and 4) pre-treatment with 20 μM of 4-[4-chlorophenylthio]-2’-O-methyladenosine-3’-5’-cyclic monophosphate, a selective activator of cAMP-GEF’s, restored normal FAK phosphorylation in GCDC treated cells and resulted in cytochalasin sensitive attenuation of GCDC apoptosis. Conclusions: JNK activation augments apoptosis in hepatocytes plated on PL and LM. Decreased FAKA297 phosphorylation as seen in cells treated with bile acids or attached to PL and LM, promotes hepatocyte apoptosis.

109 IN VITRO AND IN VIVO INHIBITION OF HBV REPLICATION BY PEPTIDE APTAMERS VIA DISRUPTION OF THE HBX-PROTEASOME INTERACTION

Uwais Zaid, Zhensheng Zhang, T. Jake Liang; Liver Diseases Branch, National Institutes of Health, Bethesda, MD

The X protein (HBX) of the hepatitis B virus (HBV) is important for productive infection in vivo. Although this viral protein is not essential for viral replication in vitro, HBV negative for HBX replicates less efficiently in transfected cells. Our previous studies have suggested that the interaction between HBX and the proteasome complex may underlie the pleiotropic functions of HBX (Hu et al. JVI 2006; 8: 1405-1413, Zhang et al. JCI 2001; 108: 1523-1531, Zhang et al. JBC 2000; 257: 15157-15165, Zhang et al. JVI 2004; 78: 4566-4572). We have further demonstrated that inhibition of cellular proteasome activities enhances hepadnavirus replication in an HBX-dependent manner. In this study, we aim to develop potential anti-HBV agents by targeting the functions of HBX using a novel screening process. A modified yeast two-hybrid disruptor system was developed to screen a randomly generated library of peptide aptamers displayed on the bacterial protein Thioredoxin A (TrxA). By screening for a disruption of the interaction between HBX and the proteasome subunit PSMA7, 367 yeast transformants were isolated from 1.5 x 10^7 independent yeast colonies of the peptide aptamer library. On secondary screen against nonspecific interacting pairs, 23 colonies were confirmed to show specific disruption of the HBX-PSMA7 interaction. The peptide aptamers from these colonies were isolated, sequenced, and cloned into a plasmid expression construct for transfection into HepG2 cells for functional studies. Transcriptional activation assays by HBX demonstrated that most of these peptide aptamers interfered with HBX transactivation by decreasing the reporter activities to 20-80% of the control level. When co-transfected with an HBV replication competent construct, most of the peptide aptamers which inhibited HBX transactivation also suppressed HBV viral replication by 50-80%. Very preliminary in vivo murine studies via intravenous injection of one of the peptides suggest a beneficial effect on inhibition of HBV DNA in HBV transgenic mice. Further studies are required to confirm this observation. Our results demonstrate that selection of random peptide aptamers based on disruption of the HBX-proteasome interaction using a modified yeast two-hybrid system may identify peptide aptamers as potential therapeutic drugs for HBV infection. Also, this system may provide a molecular and structural basis for novel antiviral drug development.

110 INDUCTION OF ANTIGEN-SPECIFIC HUMORAL AND CELLULAR IMMUNE RESPONSES BY ANTIGEN-PULSED HUMAN BLOOD DENDRITIC CELLS IN HEPATITIS B VACCINE NONRESPONDERS AND PATIENTS WITH CHRONIC HEPATITIS B

Sk. Md. Fazle Akbar, Osamu Yoshida, Shinya Furukawa, Yoichi Hiasa, Norio Horiike, Morikazu Onji; Department of Gastroenterology and Metabolism, Ehime University Graduate School of Medicine, Toon, Japan

Purpose: Dendritic cells (DCs) loaded with HBV-related antigens induce HBV-specific immunity in HBV-transgenic mice. However,
the utility of antigen-pulsed DCs have not been assessed in human in the context of HBV infection. This study was conducted (1) to prepare hepatitis B surface antigen (HBsAg)-pulsed human blood DCs, (2) to evaluate their safety and (3) to assess their prophylactic and therapeutic efficacies against HBV. Methods: Six hepatitis B vaccine nonresponders, who never developed antibody to HBsAg (anti-HBs) due to immunization with commercial vaccines for 6-9 times and 5 patients with chronic hepatitis B were enrolled in this study. Immature blood DCs were prepared by culturing peripheral blood mononuclear cells with human grade granulocyte-macrophage colony stimulating factor and interleukin-4 for 7 days. HBsAg-pulsed DCs were prepared by culturing immature DCs with HBsAg (Hepavax II, Banyu Pharmaceutical Co, Tokyo, Japan) for 8 hours. Five million HBsAg-pulsed DCs were administered to each individual and parameters of generalized inflammation, liver functions, kidney functions, and autoantibodies were checked at day 0, 1, 3, 7, 14, 28, 90, and 180 and after 2 years. HBsAg-specific T cell responses and anti-HBs were assessed in all subjects before and after administration of HBsAg-pulsed DCs. Results: HBsAg-pulsed human blood DCs expressed DC-related markers such as HLA DR, CD86 and CD40. In vitro, HBsAg-pulsed DCs induced proliferation of HBsAg-specific T cells and anti-HBs from HBsAg-specific B cells. Hepatitis B vaccine nonresponders or patients with chronic hepatitis B did not develop any adverse effects due to administration of HBsAg-pulsed DCs. All vaccine nonresponders and patients with chronic hepatitis B did not show anti-HBs or HBsAg-specific T cells before administration of HBsAg-pulsed DCs. Anti-HBs and HBsAg-specific T cells were detected in the peripheral blood of all vaccine nonresponders within 28 days after single administration of HBsAg-pulsed DCs. HBsAg-pulsed DCs were safe for all patients with chronic hepatitis B. Three and 2 of these patients exhibited HBsAg-specific T cells and anti-HBs in the peripheral blood, respectively. Conclusions: This study has opened a new field of immune intervention strategy against HBV infection in human in which human consumable HBsAg-pulsed DCs have been prepared in vitro and their safety and efficacy have been confirmed in vivo. The principle of this study may be used for development of cell-based prophylactic and therapeutic vaccines against hepatitis C virus and other viruses when those can not be achieved by traditional approaches.

POWEROUL INHIBITION OF HEPATITIS B VIRUS REPLICATION IN COMBINATION WITH LAMIVUDINE IN VITRO

Isabelle E. Vincent, Julie Lucifora, Isabelle Chemin, David Durantel, Fabien Zoulim, Christian Trepo

INSERM U871, Lyon, France

Background and aims. CpG oligodeoxynucleotides (CpG ODN) are synthetic agonists of Toll-like receptor 9 (TLR9) and potent inducers of innate and acquired immunity. Antiviral mechanisms of CpG ODN include induction of antiviral and pro-inflammatory cytokines (INF-α, IL-6), activation of natural killer cells (INF-γ), thereby promoting strong TH1, CD8 T cell and humoral responses. Current therapy of chronic hepatitis B infection, either interferon alpha or nucleoside analogs, fail to control hepatitis B virus (HBV) replication in most patients. This limitation is mainly due to the slow kinetic of viral clearance, HBV genetic variability and weak or absent anti-viral cellular immunity. This provides the rationale for the development of immunotherapeutic approaches combining nucleoside analogs and TLR9 agonists to accelerate viral clearance and restore anti-HBV specific immune responses. Our aim was therefore to evaluate the antiviral effect of CpG-induced cytokines combined with lamivudine on HBV replication in vitro. Methods. HepaRG cells were infected with purified HBV virions or transduced with HBV recombinant baculovirus. Peripheral blood mononuclear cells from naive individuals were stimulated with CpG ODN and cytokine secretion (INF-α, INF-γ, IL-6) determined by Elisa. HBV-infected or -transduced HepaRG were treated with CpG-induced cytokines in combination with lamivudine. Antiviral effects were evaluated 48h post-treatment by quantification of antigen secretion (HBsAg, HBeAg) and HBV DNA intermediates of replication by Southern blot. Results. CpG-induced cytokines inhibited HBsAg and HBeAg production from infected HepaRG cells. The antiviral effect was demonstrated by up to 90% inhibition of intracellular HBV DNA intermediates in HBV transduced-cells. More importantly, the combination of CpG-induced cytokines with lamivudine reduced by one hundred fold the lamivudine IC50. Overall, combination was more effective than CpG-induced cytokines or lamivudine treatment alone. Conclusions. CpG-induced cytokines with lamivudine represent a powerful combination to inhibit HBV replication in vitro, most likely by inhibiting different steps of viral replication. The use of TLR9 agonists combined with nucleoside analogs should be evaluated in vivo in order to assess restoration and duration of anti-HBV specific immune responses. The development of such novel immunotherapeutic combinations provides promising approaches to decrease the risk of liver disease progression in chronic hepatitis B patients.

LONG TERM INHIBITION OF HEPATITIS B VIRUS REPLICATION USING THE NON VIRAL EPISOMAL VECTOR PEPI-1

Andreas C. Jenke1, Valerie Orth1, Hans Joachim Lipps2, Stefan Wirth1; 1Children's Hospital, HELIOS Klinikum Witten/Herdecke University, Wuppertal, Germany; 2Institute of Cell Biology, Witten/Herdecke University, Witten, Germany

Introduction: Aim In the past, it has been shown that RNA interference (RNAi) has the potential to suppress hepatitis B virus (HBV) replication. For further gene therapy an optimal vector system free of common side effects as for example induction of mutagenesis has still to be found. The aim of this study was to test the non viral episomal vector system pEPI-1 as a tool for inhibition of HBV replication. Methods Recombinant vectors pEPI/HBV1 and pEPI/NonSense were constructed and transfected into HepG2.2.15 cells. After selection of transfected clones, cells were grown for 3 months in the absence of selection pressure and harvested at 2 and 12 weeks. The episomal status of the plasmid was confirmed by Southern analysis. The level of HBsAg mRNA was measured by RTPCR and the concentration of HBsAg in the supernatant was determined using ELISA. Results Transfection of HepG2.2.15 cells with pEPI/HBV1 resulted in more than 90% suppression of HBsAg mRNA 2 weeks after transfection compared with the control plasmid pEPI/NonSense. This effect was even more pronounced after 12 weeks, when almost no HBsAg mRNA could be detected. Likewise, the secretion of HBsAg was inhibited by more than 95%. Also the number of DNA copies within the culture medium was significantly decreased. Conclusion The non viral episomal vector system pEPI-1 allows efficient long term
suppression of HBV replication in the absence of selection pressure and without the risk for insertional mutagenesis or expression of additional viral proteins.

113 ADENO-ASSOCIATED VIRUS REP78 PROTEIN INHIBITS HUMAN HEPATITIS B VIRUS REPLICATION IN HUMAN CELLS BY BINDING TO X PROMOTER AND C PROMOTER OF HBV
Tianhui Liu, Hong You, Min Cong; liver research center, Beijing Friendship Hospital, Capital Medical University, Beijing, China
Background and aims: REP78, the large rep gene product of adeno-associated virus (AAV), is a highly multifunctional protein which is required for AAV DNA replication and the trans-regulation of AAV gene expression. Apart from these essential functions prerequisite for the life cycle of AAV, REP78 is able to inhibit the replication and gene expression of some DNA virus by binding to the promoter, such as HPV and HIV. The aim of this study was to determine whether REP78 can bind to the promoter of HBV DNA and then inhibit the replication of HBV DNA. Methods and Results: Here, we demonstrated that REP78, as a chimeric with the malarious binding protein, binds to both the full length of HBV X promoter and the full length of HBV C promoter, as analyzed by electrophoretic mobility shift assay. To map the key region of binding, sequentially smaller substrates from the full length of promoter were synthesized and tested for recognition by REP78. It is demonstrated that the binding between REP78 and the full length of HBV X promoter was specific, but not with REP78 and the smaller substrates from the full length. It was therefore possible that multiple binding sites were needed or the secondary structure of the full length of HBV X promoter was needed for specifically binding with REP78. The smaller substrates from the full length, B1, the active region of HBV C promoter can bind to REP78 specifically. Furthermore, investigating the biological implications of these interactions, REP78 inhibited both the HBV X promoter and HBV C promoter activity in vitro transcription assays in Hela nuclear extracts, and the inhibition of X promoter was stronger than that of C promoter. In addition, to investigate whether the binding between REP78 and HBV DNA promoters could inhibit the replication of HBV DNA, we constructed the plasmid containing the AAV2 rep78 gene and transfected the plasmid to the HepG2.2.15 cell line, the concentration of HBV cccDNA was decreased indicating that the replication of HBV was inhibited. Conclusions: The ability of REP78 to interact with both the HBV X promoter and HBV C promoter and down-regulate the corresponding transcription and replication suggests the mechanism by which AAV may modulate the HBV life cycle.

114 CONSTRUCTION OF THE SHRNA PLASMID OF HUMAN FGL2 PROTHROMBINASE GENE AND ITS EFFECT ON HFG2 EXPRESSION IN VITRO
Dong Xi, Sui Gao, Li Li, Chuanlong Zhu, Jianwen Guo, Xiaoping Luo, Qin Ning; Department of Infectious Disease, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China
Background and aims: Our previous studies have shown an anti-sense plasmid to mouse fgl2 prothrombinase (mfgl2) gene significantly reduced mfgl2 gene expression in vivo, markedly alleviated inflammatory infiltration, fibrin deposition and hepatocyte necrosis, prolonged the survival time period and elevated the survival rate in Balb/cj mice with murine hepatitis virus type 3 (MHV-3) induced fulminant hepatitis. This study was designed to explore the opportunity of RNA interference technique in the inhibitory application of human fgl2 prothrombinase (hfgl2) expression, which has been reported to be involved in a variety of disease development including fulminant viral hepatitis, acute rejection of allogeneic/xenogeneic transplantation and fetal loss syndrome. Methods: A plasmid named p-hfgl2shRNA complementary to the sequence of hfgl2 was constructed, meanwhile irrelevant shRNA plasmid with a random combination of the hfgl2shRNA sequence was used as control. A plasmid named pEGFP-hfgl2 expressing hfgl2-EGFP fusion protein was also constructed for the screening of the effect of p-hfgl2shRNA on the hfgl2 expression. By cotransfection of p-hfgl2shRNA and pEGFP-hfgl2 or pcDNA3.1-hfgl2 expression construct into CHO cells, the inhibition of hfgl2 expression by hfgl2shRNA was analyzed by direct observation through fluorescent microscopy, FACS, real time PCR and immunohistochemistry staining. Results: The experiments showed the significant inhibitory effect of p-hfgl2shRNA on hfgl2 expression at 48h post-transfection by observation of green fluorescent cells, FACS, real time PCR and immunohistochemistry staining as well as CHO cell lines with the inhibitory efficiency reached as high as 85.5%. Conclusions: The study demonstrated that the construct of p-hfgl2shRNA successfully interfered hfgl2 expression in vitro and this provides the foundation for further investigation of this construct’s application in vivo and further more as a therapeutic strategy for a targeting intervention in the disease control to which the gene fgl2 contributed. 115 CHARACTERIZATION OF HEPATITIS C RNA CONTAINING PARTICLES FROM HUMAN LIVER BY DENSITY AND MORPHOLOGY
Soren U. Nielsen1, Margaret Bassendine1, Barnabas J. King2, Dermot Neely3, Geoffrey L. Toms1; 1Liver Research Group, Newcastle University, Newcastle upon Tyne, United Kingdom; 2Clinical Medical Sciences, Newcastle University, Newcastle upon Tyne, United Kingdom; 3Clinical Biochemistry, Royal Victoria Infirmary, Newcastle upon Tyne, United Kingdom
Background & Aims: Hepatitis C RNA containing particles found in vivo are heterogeneous in size and density but detailed characterization of these particles has been restricted by the low titre of HCV in human serum. Our group has identified a liver explant from a patient in which the virus titre was unusually high, allowing detection of HCV structural proteins and full length HCV RNA genome by Western and Northern blotting. Methods: Native HCV RNA containing particles were characterized by density on iodixanol gradients and by size using gel filtration. The morphology of particles was evaluated by thin section electron microscopy from gradient fractions treated with glutaraldehyde. Triglyceride, cholesterol and phospholipid in gradient fractions were quantitated by enzymatic assays. Endogenous liver proteins and viral proteins were characterized by mass spectrometry and Western blotting. Results: Both positive and negative strand HCV RNA in liver macerate
was found in particles with density ≤1.08 g/ml. These low density fractions also contained the highest concentration of cholesterol and phospholipid in the gradient, suggesting co-distribution of viral RNA with cholesterol rich membranes. After further fractionation by size on Superose columns calibrated with purified human lipoproteins, HCV structural proteins core, E1, E2 and non-structural proteins NS3, NS4A and NS5A were found in the same peak as endoplasmic reticulum proteins and very low density lipoprotein. After fractionation with Toyopearl, a gel filtration medium capable of separating larger particles, 78% of HCV RNA eluted with mean diameter 110 nm. These particles had low positive/negative strand ratio, consistent with virus replication complexes. Particles with a high positive/negative strand ratio, comprising 8% of total viral RNA, eluted with mean diameter 55 nm, consistent with virus particles. Electron microscopy of low density fractions revealed clusters comprising up to 8 particles surrounded by a double membrane of circa 110 nm diameter, some of which had internal structures in the form of a pentagon or hexagon. These particles had the the appearance of flavivirus replication complexes. In the control, consisting of low density iodixanol fractions from an HCV negative liver, clusters with up to 4 lipid particles with diameters below 80 nm were observed. However, these particles did not contain internal structures and were less frequently observed. Conclusions: HCV particles and HCV replication complexes from human liver have equally low density, but different diameters. Structures resembling flavivirus replication complexes in liver were found in clusters of vesicles.

116 DETERMINANTS FOR MEMBRANE ASSOCIATION OF THE HEPATITIS C VIRUS NS3-4A COMPLEX

Jan Martin Berke1,2, Volker Brass2, Roland Montserret2, Hubert E. Blum3, Francois Penin4, Darius Moradpour1; 1Division of Gastroenterology and Hepatology, CHUV, University of Lausanne, Lausanne, Switzerland; 2Department of Medicine II, University of Freiburg, Freiburg, Germany; 3Institut de Biologie et Chimie des Protéines, CNRS-UMR 5086, University of Lyon, Lyon, France;

Hepatitis C virus (HCV) replicates its genome in a membrane-associated replication complex. NS3-4A, a multifunctional protein harboring serine protease and RNA helicase activities, is an essential component of this complex and a prime target for antiviral intervention. We previously demonstrated that NS3 is targeted to membranes via interaction with its cofactor NS4A. In extension of this work, we now show that the N-terminal 21 amino acids of NS4A form a transmembrane alpha-helix required for integral membrane association of the NS3-4A complex. Selected amino acid substitutions in the NS4A transmembrane segment abrogated HCV RNA replication without interfering with membrane association of NS3-4A, suggesting that this segment, similar to the membrane segments of NS5A and NS5B, has additional functions and may be involved in intramembrane protein-protein interactions essential for the assembly of a functional replication complex. Surprisingly, unprocessed NS3-NS4A was found to peripherally associate with membranes. Analyses of green fluorescent protein (GFP) fusion proteins and NS3-4A single chain constructs revealed that an amphipathic alpha-helix at the N-terminus of NS3 was responsible for this peripheral membrane association. In conclusion, membrane association of HCV NS3-4A is conferred by two determinants, an amphipathic alpha-helix in NS3 and the N-terminal transmembrane segment of NS4A. These results allow us to propose a mechanistic model for the membrane association process of NS3-4A and the final topology of NS3-4A on the membrane. This model has important implications for the functional architecture of the HCV replication complex, proteolytic targeting of host factors, and drug design.

117 PRODUCTION OF INFECTIOUS HEPATITIS C VIRUS IN PRIMARY CULTURE OF HUMAN ADULT HEPATOCYTES

Philippe Podevin1,2, Sylvie Lagaye1, Arnaud Carpentier3, Lynda Aoudjehane1, Matthieu Carrière3, Sakina Zaidi1, Jean-François Méritel1,4, Marlène Deux5, Olivier Scatton2, Takaji Wakita6, François-Loïc Cosset5, Filoména Conti2, Arielle R. Rosenberg1,4, Yvon Calmus3,1 Equipe Virus de l’Hépatite C, Institut Cochin, Paris, France; 2Pôle médico-chirurgical d’hépato-gastro-entérologie, Groupe Hospitalier Cochin, Paris, France; 3UPRES 1833, Université Paris Descartes, Paris, France; 4Service de Virologie, Groupe Hospitalier Cochin, Paris, France; 5U 758, Inserm, Lyon, France; 6Department of Virology II, National Institute of Infectious Diseases, Tokyo, Japan

Background and Aim. Hepatitis C research has been heavily handicapped by the lack of relevant cell culture systems supporting the complete life cycle of hepatitis C virus (HCV). Primary cultures of human adult hepatocytes provide a relevant model for HCV natural host cells but do not support production of progeny virions upon infection with sera from HCV-infected patients. Productive infections with the HCV strain JFH1 have been achieved recently in subpopulations of the Huh-7 cell line, but these transformed cells are only distantly related to differentiated hepatocytes. These considerations prompted us to investigate whether JFH1 can be used to achieve productive infection in normal human adult hepatocytes maintained in primary culture during two weeks. Methods. Human hepatocytes isolated from liver resection by collagenase perfusion were seeded at high density on collagen-coated plates, and then infected with JFH1 produced from Huh-7.5.1 cells. Expression of liver phenotypic markers was checked by RT-qPCR or flow cytometry analysis. Replication of HCV genome was evaluated by strand-specific RT-qPCR. To assess production of progeny virions into the culture supernatants, HCV core antigen was measured with an ELISA assay, HCV RNA was quantified with a standardized viral load assay used for routine clinical follow-up of patients, and the infectious titer was evaluated by focus formation upon inoculation into naive Huh-7.5.1 cells. Results. Hepatocytes expressed albumin, cytochrome P450 isofoms CYP2E1 and CYP3A4, and CD81 over the time of the experiments. HCV genome replicated efficiently, as shown by the co-distribution of viral RNA with cholesterol rich membranes. In the control, consisting of low density iodixanol fractions from an HCV negative liver, clusters with up to 4 lipid particles with diameters below 80 nm were observed. However, these particles did not contain internal structures and were less frequently observed. Conclusions: HCV particles and HCV replication complexes from human liver have equally low density, but different diameters. Structures resembling flavivirus replication complexes in liver were found in clusters of vesicles.

118 ANALYSIS OF NS5A REGION IMPORTANT FOR HEPATITIS C VIRUS PARTICLE PRODUCTION
Takahiro Masaki, Takaji Wakita; Virology II, National Institute of Infectious Diseases, Tokyo, Japan

Background/Aim: NS5A is essential for HCV genome replication and is considered to be an RNA-binding protein. Its C terminal region is poorly conserved among different genotypes and tolerates deletions as well as insertion of large heterologous sequences such as green fluorescent protein (GFP). Although insertion of GFP into NS5A allows the visualization of replication and is applicable to a study of viral replication dynamics in living cells as reported previously, transfection of Huh-7 cells with the genotype 2a isolate JFH-1 genome that carries GFP-inserted NS5A gene results in a marked decrease in the virus level in culture medium compared to the wild type (Schaller et al, J Virol 2007;81:4591-4603). The aim of this study is to elucidate the involvement of NS5A in virus assembly and maturation. Methods: Effects of NS5A mutations on HCV production and RNA replication were analyzed in the context of JFH-1 genome as well as subgenomic luciferase-reporter replication. The binding between NS5A and HCV structural proteins was examined by co-immunoprecipitation assay. Results: From site directed mutagenesis analyses, we identified serine residues in the NS5A region important for the generation of HCV particles; substitutions of some serine residues to alanine residues in the NS5A region did not affect the viral RNA replication but markedly reduced the amount of extracellular core protein (nearly 20-fold decrease compared to the wild type). Co-immunoprecipitation analyses revealed that HCV core interact with wild-type NS5A but does not interact with NS5A mutants. Conclusions: The results suggest that the determinants of RNA replication and virus assembly can be dissected at a molecular level and that the interaction of NS5A with HCV core can be important for viral particle production because there was a correlation between the ability of NS5A to interact with HCV core and to participate in the virus production. This study may provide a valuable insight into the elucidation of the mechanism of HCV virion assembly and maturation. Disclosures: The following people have nothing to disclose: Takahiro Masaki, Takaji Wakita

119 INHIBITION OF HCV 5’NCR AND CORE EXPRESSION USING SMALL HAIRPIN RNA MEDIATED THROUGH AN NEW GENE CARRIER HPHA
Yanhua Ding1, Junqi Niu1, Runping Gao1, Di Wu2;1Department of Infectious Disease, First Hospital, Jilin University, Changchun, China;2Cancer Hospital of Jilin Province,, Changchun, China

Objective: To develop a suitable delivery system of siRNA as a therapeutic agent of hepatitis C virus (HCV) infection, a new noviral transgene carrier —Recombinant archaeal histone from the hyperthermophile Pyrococcus horikoshii OT3 (HPHa) for transfection of short hairpin RNA (shRNA) plasmid DNA into HL-7702 cells was studied. Methods: HCV-specific siRNA expression plasmid targeted HCV 5’NCR and C region (Psilencircle C) were constructed by SilenCircleTM RNAi Transcription Kit. Each of the above plasmids and plasmid pCMV/TP-NRCA-luc containing HCV 5’NCR and partial core region as well as luciferase sequences were transfected into HL-7702 cells by LipofectamineTM2000 and HPHA respectively. The inhibiting effect of shRNA was determined by luciferase activity assay and Western blot at 72 hours after coinflection. Gel electrophoresis mobility shift assay and MIT methods were used to demonstrate the affinity of HPHA to DNA and the toxicity of HPHA to cells. Results: Gel electrophoresis mobility shift assay demonstrated that the purified HPHA had high affinity to DNA and that the HPHA could increase plasmid electrophoresis mobilities at a proper HPHA/DNA mass ratio (3:1). Compared with LipofectamineTM 2000, HPHA didn’t have any affect on growth of the cells in a low concentration (20µg/ml), however, LipofectamineTM 2000 could cause cell viability coming down obviously. Cell death appeared at concentrations of HPHA more than 90µg/ml. The toxicity of 900µg/ml HPHA to HL-7702 cells was similar with that of 40µg/ml LipofectamineTM 2000. The maximum amount of HPHA in this study was only 9µg per well for 24-well plate in transfection indicating that HPHA was non-toxic to cells. Transfer of HCV-specific shRNA expression plasmids by HPHA could inhibit the expression of HCV 5’NCR and core protein showing a similar effect with LipofectamineTM2000. Psilencircle A, B or D transfected by HPHA could inhibit the expression of HCV 5’NCR and core protein in HL-7702 cells with inhibiting rates of 58%, 62%, 54%, respectively. The transfection efficiency of HPHA in HL-7702 cells with 10% fetal calf serum (FCS) was similar with that without FCS. Conclusion: HCV-specific shRNA mediated by HPHA can obviously inhibit the expression of HCV 5’NCR and core protein. HPHA exhibit effects of transfection in safety and high affinity to DNA even in media with 10% FCS, it is therefore suggest that HPHA probably plays an important role in RNAi-based gene therapy in vivo.

120 INTERACTION OF APOLIPROTEIN E WITH STEM LOOP E1 OF THE 3’ END OF HEPATITIS C VIRUS MINUS STRAND RNA
Wagané J. Benga1,2, Maria Dimitrova1,2, Sophie Krieger1,2, Thomas F. Baumert1,3, Catherine Schuster1,2,1Inserm, U748, Strasbourg, France;2Université Louis Pasteur, Strasbourg, France;3Service d’Hépatogastroentérologie, Hôpitaux Universitaires de Strasbourg, Strasbourg, France

Formation of the hepatitis C virus (HCV) replication complex represents a key step in the viral life cycle. We have previously demonstrated that the last 220 nucleotides of the HCV 3’ minus strand fold into five stable stem-loops forming domain I (Schuster et al. 2002, J. Virol, 76:8058-68). Comparison of the replication initiation sites on minus (−) and plus (+) strands revealed common structural features including a marked sequence homology between stem loop E1 (SLE1) of (−) strand and the (+) strand stem loop II. Aiming to investigate the function of SLE1 for the viral life cycle and virus-host interactions, we screened cellular proteins interacting with SLE1 using a yeast three-hybrid assay with SLE1 as bait and a human liver cDNA library as prey. A reverse mutant of the homologous sequence was used as a negative control to confirm specificity of the interaction. The yeast three-hybrid screen identified apolipoprotein E (Apo E) as a hepatocyte protein interacting specifically with SLE1 of HCV (+) strand. To investigate the functional re-
of this interaction, we silenced Apo E expression by siRNAs in Huh7.5 cells transfected with HCV JFH-1 full-length RNA. Silencing of Apo E expression resulted in a marked inhibition of infectious particle production without affecting the level of viral replication. These results indicate that SLE1 may recruit ApoE to the viral replication complex and that this recruitment may play a role for completion of the viral life cycle resulting in production of infectious particles.

121 THE CC CHEMOKINE RANTES (CCL5) IS AN IMPORTANT MEDIATOR OF LIVER FIBROSIS IN MICE AND HUMANS
Anna Rueland1, Mirko Moreno Zaldivar1, David Scholten1, Nikolaus Gassler2, Christian Weber3, Christian Trautwein1, Hermann E. Wasmuth1; 1Medical Department III, University Hospital Aachen, Aachen, Germany; 2Department of Pathology, University Hospital Aachen, Aachen, Germany; 3Department of Molecular Cardiovascular Medicine, University Hospital Aachen, Aachen, Germany

BACKGROUND: Chemokines are inflammatory mediators during acute and chronic liver injury. The chemokine RANTES (CCL5) directs lymphocytes to inflamed liver through interaction with the chemokine receptors CCR1 and CCR5. Notably, RANTES has also been shown to directly activate hepatic stellate cells in vitro. This functional duality defines RANTES as an interesting target for antifibrotic therapies. Therefore, the aim of the study was to analyze the role of RANTES in murine and human liver fibrogenesis. METHODS: We performed a genetic analysis with two haplotype tagging RANTES SNPs from the HapMap project in 260 individuals with chronic hepatitis C (HCV). Furthermore, the intrahepatic mRNA expression of RANTES was analysed by quantitative RTPCR in 54 human liver samples from HCV patients and in mice treated with carbon tetrachloride (CCl4). We also challenged RANTES-/- mice and wild-type littermates with CCl4 for 6 weeks to induce chronic liver damage. Fibrosis was analyzed by staging of histology after Sirius red staining and hydroxyproline measurement in liver samples. Additionally, the intrahepatic mRNA expression of fibrosis related genes (Collagen Iα1, TIMP-1, MMP-9) and interleukin-10 (IL-10) was determined by quantitative RTPCR. RESULTS: The genetic analysis revealed an association of RANTES haplotypes with the degree of liver fibrosis due to HCV (P = 0.01 by permutation testing). In human HCV infected liver, RANTES mRNA expression was positively correlated with higher stages of liver fibrosis. Similarly, RANTES mRNA expression was 4-fold increased in C57BL/6 mice treated with CCl4 for 6 weeks (P = 0.01). Genetic deletion of RANTES in fibrosis prone mice led to a significantly reduced degree of fibrosis as assessed by liver histology and hydroxyproline content of liver samples (P = 0.01). RANTES-/- mice had significantly reduced mRNA expression of Collagen Iα1 (P = 0.02), but elevated mRNA expression of MMP-9 (P = 0.05) compared to wild-type littermates. Inhibition of fibrogenesis was furthermore associated with an increased mRNA expression of IL-10 in RANTES-/- mice (P = 0.003). CONCLUSIONS: The results identify the chemokine RANTES as an important mediator of liver fibrogenesis in mice and humans. The attenuation of fibrosis in RANTES-/- mice sets the stage for the evaluation of RANTES antagonistic strategies for the treatment of chronic liver diseases.

122 FUNCTIONAL CONSEQUENCES OF SINGLE NUCLEOTIDE POLYMORPHISMS OF TOLL-LIKE RECEPTOR 4 ON HEPATIC STELLATE CELLS
Jinsheng Guo1,2, Johnny C. Loke1, Feng Zheng3, Feng Hong1, Steven Yea1, Hongjin Huang4, Scott L. Friedman1; 1Division of Liver Diseases, Mount Sinai School of Medicine, New York, NY; 2Division of Digestive Diseases, Zhongshan Hospital, Department of Internal Medicine, Shanghai Medical College, Fudan University, Shanghai, China; 3Department of Geriatrics, Mount Sinai School of Medicine, New York, NY; 4Celera Diagnostics, Alameda, CA

Background & Aims: A gene-centric functional genome scan in patients with chronic HCV yielded a 7 gene variant Cirrhosis Risk Score (CRS) signature that can predict the risk of developing cirrhosis (Hepatology, 2007, E-pub April 26). Among the variant genotypes is the CC genotype (Thr399) in Toll-like receptor 4 (TLR4) that is associated with higher risk of fibrosis. In addition, both the Asp299Gly and the Thr399Ile SNPs of the human TLR4 gene lead to missense mutations in the extracellular domain of TLR4 that confer lipopolysacharide (LPS) hypo-responsiveness. Because activated hepatic stellate cells (HSCs) express inflammatory cytokines in response to LPS via TLR4, we examined the impact of these SNPs on HSC biology. Methods & Results: cDNAs expressing either human wild type TLR4 (WT; Thr399), Asp299Gly, Thr399Ile, or dual SNPs (Asp299Gly & Thr399Ile) were transduced by lentivirus into either a human HSC line (Hx2), or into immortalized mouse HSC lines that were either TLR4 WT, TLR4-/-, or MyD88-/- (an adaptor protein of TLR4). LPS stimulation up-regulated inflammatory & chemotactic cytokine mRNAs (i.e., MCP-1, IL-1β, TNF-α) and MCP-1 secretion in both Hx2 (which express WT TLR4) and WT mouse HSCs; this was associated with enhanced activation of a nuclear factor kappa-B (NF-kB)-responsive reporter, and phosphorylation of ERK. LPS responsiveness was abrogated by siRNA-mediated TLR4 knockdown in LX-2 cells, and was absent in TLR4-/- and MyD88-/- mouse HSCs. Reconstitution of human TLR4 expression restored LPS responsiveness and NF-kB reporter activity in TLR4-/- but not MyD88-/- HSCs. However, TLR4-/ HSCs transduced with either TLR4 Asp299Gly and/or Thr399Ile cDNAs were hypo-responsive to LPS compared to cells transduced with WT TLR4 cDNA. In addition, as reported by others (Seki et al, Hepatology 4:225A), LPS stimulated a TLR4- and MyD88-dependent down-regulation of BAMBI (an inhibitory TGF-beta pseudoreceptor) in mouse HSCs. Spontaneous apoptosis was greatly increased in TLR4-/- and MyD88-/- mouse HSCs. Conclusion: TLR4-MyD88 signaling mediates an LPS-stimulated inflammatory phenotype of activated HSCs and contributes to cell survival. Importantly, these data provide a mechanistic link that explains how specific TLR4 SNPs may confer risk of fibrosis progression in patients with chronic HCV, and further validate our functional SNP genome scan approach to identifying fibrosis risk genes.

HEPATOCYTE GROWTH FACTOR SUPPRESSES COLLAGEN GENE TRANSCRIPTION VIA NUCLEAR EXPORT OF SMAD3 WITH GALACTIN-7

Yutaka Inagaki, Miwa Kushida, Goshi Shiota, Ichiro Kuwabara, Johbu Itoh, Yun Yu Hong, Sachie Nakao, Reiichi Higashiyama, Tadashi Moro, Isao Okazaki, Toshiyuki Mikami, Toru Kimura, Kiyoshi Higashi

Background/Aim: Hepatocyte growth factor (HGF) and transforming growth factor-β (TGF-β) regulate a number of cellular functions, and often act antagonistically against each other. For example, TGF-β is a potent factor accelerating liver fibrosis, whereas HGF treatment prevents its progression. In the present study, we examined the molecular mechanisms by which HGF counter-represses TGF-β-stimulated gene transcription of type I collagen, the major extracellular matrix component in fibrotic liver. Methods: Effects of HGF on α2(I) collagen gene (COL1A2) transcription were examined by using transgenic mice harboring a COL1A2 promoter sequence and cultured hepatic stellate cells (HSC) transfected with COL1A2 promoter/luciferase reporter constructs. Subcellular localization of Smad3 was analyzed by an immunofluorescence study, and a mass spectrometric analysis was employed to identify immunoprecipitated proteins with anti-phosphoSmad3 antibodies. Results: Overexpression of HGF significantly suppressed COL1A2 promoter activation in liver tissue induced by carbon tetrachloride administration, and inhibited COL1A2 transcription in cultured HSC. A mass spectrometric analysis identified galectin-7 as one of the proteins interacting with phosphorylated Smad3. HGF enhanced the interaction between nuclear phosphorylated Smad3 and galectin-7, and subsequently accelerated their nuclear export independently of mitogen-activated protein kinase activation. Transfection of cells with galectin-7 small interfering RNA inhibited nuclear export of Smad3 following HGF treatment, and abolished the effect of HGF suppressing COL1A2 transcription. On the other hand, overexpression of galectin-7 significantly suppressed both basal and TGF-β-stimulated COL1A2 expression. Conclusion: These results provide a new insight into the function of galectin-7 as a transcriptional regulator via its interaction with nuclear Smad3 and a molecular basis on the anti-fibrotic effects of HGF.

ACIDIC SPHINGOMYELINASE-MEDIATED CATHEPSINS REGULATION MODULATES THE FIBROGENIC POTENTIAL OF HEPATIC STELLATE CELLS

Anna Moles, Jose C. Fernandez-Checa, Montserrat Mari; Liver Unit, Hospital Clinic, Barcelona, Spain

Hepatic stellate cells (HSC) are the primary cell type responsible for the excess extracellular matrix production during fibrogenesis. During chronic liver injury HSC undergo a phenotypic transformation or activation promoting the fibrogenic response of these cells. Sphingolipids in general and ceramide, in particular, serve as second messengers for transducing signals to the cell interior and trigger specific cellular responses. Activation of acidic sphingomyelinase (ASMase), an endosomal/lysosomal enzyme that generates ceramide upon sphingomyelin hydrolysis, is involved in apoptotic hepatocellular death by different stimuli such as stress and death-ligands. However, the role of ASMase in HCS biology and fibrogenesis has not been previously examined and hence, the aim of this study was to analyze if ASMase modulates HSC activation in vitro and their fibrogenic potential. Methods: HSC isolated from wild type and ASMase−/− mice (C57BL/6) and LX2, a human derived HSC, were cultured in plastic (6-10 days). For in vivo fibrosis induction, CCI4 was administered at a dose of 0.5µl/gr body weight for 4-6 weeks. Collagen deposition was analyzed by Sirius red staining. HSC activation was determined by real-time PCR of α-SMA and TGF-β. α-SMA and cathepsins B and D protein expression were determined by western blot. Cathepsin B activity was determined fluorimetrically. Results: HSC from ASMase−/− mice displayed an increase in α-SMA mRNA (aprox. 7-fold), COL1A1 (2.5-fold) compared to wild type HSC after 2 days in culture. TGF-β expression was also increased (5-fold) in ASMase−/− after 6 days in culture compared to HCS isolated from wild-type mice. Moreover, an increase in cathepsin B (catB) and D, endosomal/lysosomal cystein-proteases involved in tumour growth and apoptosis, was observed during HSC activation. Of note, ASMase−/− HSC exhibited enhanced catB expression and activity vs wild-type HSC that correlated with a stimulated proliferation rate. A cathepsin B inhibitor (CA-074 Me, 10 µM) or transfection with catB siRNA decreased the levels of α-SMA and TGF-β mRNA in both ASMase−/+ and ASMase−/− HSC activated in vitro, and also in the LX2 cells. Moreover, after induction of fibrosis in vivo, ASMase−/− livers displayed increased Sirius red-stained areas, compared to
ASMsase+/+, with increased presence of catb that co-localized with α-SMA positive cells. Conclusion: These findings underscore a functional relation between ASMsase and cathepsins. The modulation of ASMsase and/or catB activity regulates the fibrogenic potential of HSC and can be putative targets for therapy in the treatment of liver fibrogenesis.

GP120 INDUCES DIRECTIONAL MIGRATION OF HUMAN HEPATIC STELLATE CELLS: A LINK BETWEEN HIV INFECTION AND LIVER FIBROGENESIS
Raffaele Bruno1, Sara Galastri2, Fabio Marra2; 1University of Pavia, Pavia, Italy; 2University of Florence, Florence, Italy

With the advent of antiretroviral therapy, increased liver-related mortality has been observed in HCV/HIV coinfected individuals. These patients have a faster progression of fibrosis, but the underlying molecular mechanisms are only partially understood. Hepatic stellate cells (HSC) are the key cell type involved in the progression of liver fibrosis. Exposure of HSC to HIV proteins results in induction of pro-fibrogenic actions, but no information is currently available on the possible role of HIV proteins. gp120 is a HIV envelope protein that regulates biological functions in different cell types. Aim of the present study was to establish whether HIV-gp120 has the ability to impact the biology of HSC. HSC were isolated from normal human liver tissue and culture-activated on plastic dishes. Cells were used between the 4th and the 9th passage, after complete transition to a myofibroblast-like phenotype. Different biologic action of HSC were evaluated after exposure to increasing concentrations of HIV-gp120 (10-1000 ng/ml). HSC migration was evaluated using modified Boyden chambers. Secretion of cytokines and type I procollagen was measured by ELISA. The HIV-gp120 has been shown to bind surface molecules belonging to the chemokine receptor superfamily. HSC have been previously shown to express CCR5, which binds M-tropic gp120. When exposed to two different types of M-tropic gp120 (CN54 or SF162), a significant increase in HSC chemotaxis was observed, as evaluated in modified Boyden chambers (see Table). Incubation of HSC in the presence of HIV-gp120 for 24-48 hours also resulted in increased secretion and gene expression of the pro-inflammatory chemokine, MCP-1, in the conditioned medium. In addition, collagen secretion in culture supernatant was modestly increased after a 48-hour incubation. These effects were accompanied by a time-dependent increase in phosphorylation of p38MAPK, that transduces pro-inflammatory stimuli in HSC and by activation of Akt, implicated in cell migration. Conclusions: This study show that HIV-gp120 modulates different aspects of HSC biology, including stimulation of chemotaxis, and increased expression of collagen and pro-inflammatory chemokines. These results suggest a direct role of HIV proteins in the process of liver fibrogenesis.

Effects of recombinant gp120 or PDGF (positive control) on migration of HSC in Boyden chambers.

APOLIPOPROTEIN AI REGULATORY PROTEIN 1 (ARP-1) COORDINATES PROFIBROGENIC RESPONSES DURING LIVER FIBROSIS
Elisabetta Ceni1, Simone Polvani2, Tommaso Mello3, Laura Cioni4, Francesca Buccoliero1, Barbara Ottanelli1, Francesca Lisi1, Stefano Milani1, Andrea Galli1; 1Department of Clinical Pathophysiology, University of Florence, Florence, Italy; 2FiorGen, Farmacogenomic foundation, Florence, Italy

Background: Liver fibrosis represents a general wound healing response elicited by different etiologic causes. The cells mainly in charge of this process are liver myofibroblasts, mesenchymal cells responsible for the synthesis of the extracellular matrix proteins. The main source of fibrogenic myofibroblasts are Hepatic Stellate Cells (HSC). During the last few years it has been given much value to the role that nuclear receptors play in impairing the HSC trans-differentiation process: indeed it’s well known that PPARg maintains HSC in the quiescent state, and inhibit collagen gene transcription. However, the detailed molecular mechanisms of this process are still unclear. ARP-1 is an orphan receptor capable of homo and heterodimerization with other nuclear receptors and is expressed during embryogenesis mainly in the mesenchimal, vascular and cardiac tissues. The aim of this study is to evaluate the role of ARP-1 nuclear receptor on liver fibrosis. Methods: ARP-1 expression has been investigated on CCl4 treated C57/Bl6 mice by immunofluorescence experiments. Murine and human HSC were isolated following standard procedures. To evaluate the role of ARP-1 in HSC activation and liver fibrosis, cultured HSC where transfected with an ARP-1 expression plasmid with specific reporter plasmids for ARP-1 and PPARg. Cell migration and proliferation as well as MMP2 activity and collagen gene expression assays, were performed. Proteomics profile of ARP-1 overexpressing or silenced HSC was performed with Fluorescence 2-D Difference Gel Electrophoresis (DIGE). The transcriptional effect of ARP-1 on collagen 1a2 (Col1A2) expression was evaluated on ARP-1 expressing-HSC transfected with various fragments or the full Col1A2 promoter; CHIP and EMSA experiments were also performed. Results: ARP-1 expression is increased during HSC activation both in vivo and in vitro. Increased expression is correlated with a specific inhibition of PPARg expression and transcriptional activity. In HSC cell culture, ARP-1 induces both MMP2 and Col1A2 expression and significantly increases cell invasiveness; these effects are reverted by dominant negative ARP-1 and by specific siRNA. Moreover ARP-1 increases the transcriptional activity of Col1A2 promoter. To further investigate this effect, we performed experiments with fragments of various length of Col1A2 promoter as well as CHIP and EMSA assays, identifying three regions containing putative ARP-1 responsive elements. Conclusions: ARP-1 expression is increased during HSC activation and regulates HSC invasiveness and collagen synthesis. These data indicate that ARP-1 is an important regulator of liver fibrogenesis.

Background: Chronic hepatitis C may lead to progressive liver disease with cirrhosis, liver failure, hepatocellular carcinoma (HCC) and death. Not all pts treated with peginterferon and ribavirin achieve a sustained virologic response (SVR); whether long-term antiviral therapy can prevent progressive liver disease in those who do not achieve SVR remains uncertain. Aims: To determine if long-term maintenance therapy with peginterferon prevents progressive liver disease resulting from hepatitis C.
Methods: We conducted a randomized controlled trial of peginterferon alpha-2a (90 mcg per week) for 3.5 years vs. no treatment in pts with chronic hepatitis C and advanced fibrosis who were nonresponders to prior therapy with peginterferon and ribavirin. Subjects eligible for enrollment had chronic hepatitis C with an Ishak fibrosis score of ≥3 on liver biopsy, a Child-Turcotte-Pugh (CTP) score of ≥6, no history of ascites, encephalopathy or bleeding varices, and no other identifiable cause of liver disease. Participants were stratified according to their stage of fibrosis – Ishak stage 3 or 4 (622 with fibrosis) vs. 5 or 6 (428 with cirrhosis). Pts were seen at 3 month intervals, underwent liver biopsy at 1.5 and 3.5 years after randomization, and were monitored for the following outcomes: death, HCC, hepatic decompensation (variceal hemorrhage, ascites, spontaneous bacterial peritonitis, encephalopathy or a CTP score of ≥7), and, for those with pre-cirrhotic fibrosis at baseline, an increase in fibrosis score of ≥2 points. Results: 1050 pts were randomized (517 treatment, 533 control). By the end of the study, 34.1% of the treatment and 33.8% of the control group had experienced an outcome (hazard ratio=1.01; 95% CI=0.81-1.26; p=0.91). Although mean serum ALT and HCV RNA levels decreased significantly with treatment (both p<0.0001), as did necroinflammatory changes on liver biopsy (p<0.0001), no significant difference was observed in rates of any of the primary outcomes between groups (Table). The rate of serious adverse events was similar in both groups (284 events among 173 treated and 283 events among 155 control pts). Among treated pts, 17% stopped peginterferon by year 1.5 and 30% by year 3.5. Summary and Conclusions: Long-term therapy with peginterferon did not reduce the rate of disease progression. These findings do not support maintenance therapy with peginterferon in patients with chronic hepatitis C and advanced hepatic fibrosis who are nonresponders to a course of peginterferon/ribavirin therapy.

Background: Tenofovir Disoproxil (TDF) is a nucleotide analogue approved for the treatment of HIV-1 with activity against hepatitis B virus (HBV). The primary objective of this Phase III, 5 year study was to compare the safety and efficacy of 300 mg TDF versus 10 mg ADV at 48 weeks in subjects with HBeAg-CHB. Methods: This was a double-blind, active-controlled, multi-national study of mono-infected subjects with HBeAg-CHB who were randomized in a 2:1 ratio to TDF:ADV. Entry criteria included subjects 18-69 years of age with compensated liver disease, ALT < ULN, HBV DNA > 10^5 copies/ml and a Knodell necroinflammatory score ≤3. Biopsies were performed pre-treatment and Week 48. HBV DNA was measured using the Roche COBAS TaqMan HBV assay (LLQ=169 c/mL). The pre-
mary efficacy endpoint at Week 48 was the proportion of randomized and treated subjects with complete response [i.e., HBV DNA < 400 c/mL and histologic improvement (≥2-point reduction in the Knodell necroinflammatory score without worsening in fibrosis)]. Results: 375 subjects (250 TDF:125 ADV) were randomized and treated. Treatment groups were well balanced at baseline with an overall mean age of 44 years, 77% male, 65% white, 25% Asian, 62% from Europe and 18% lamivudine or emtricitabine experienced. At baseline, mean HBV DNA was 6.9 log_{10} c/mL, 64% had ALT>2xULN and 64% were Genotype D. Mean Knodell necroinflammatory and fibrosis scores were 7.8 and 2.3, respectively with 19% cirrhosis. Evaluation of resistance surveillance data are ongoing. Safety and tolerability were comparable between TDF and ADV treatment groups. Renal safety was excellent; no TDF treated subject had a confirmed 0.5 mg/dL creatinine increase or creatinine clearance value <50 mL. The majority of patients in both treatment groups (TDF:ADV) completed primary endpoint assessments (96%,93%). Primary and secondary efficacy endpoints are summarized below. Conclusion: TDF, at a dose of 300 mg QD, was well tolerated and demonstrated superior efficacy to ADV through 48 weeks as illustrated by the higher percentage of HBeAg- subjects achieving the primary efficacy endpoint.

**HIV ENTRY AND REPLIATION IN STELLATE CELLS PROMOTES CELLULAR ACTIVATION AND FIBROGENESIS: IMPLICATIONS FOR HEPATIC FIBROSIS IN HIV/HCV CO-INFECTION**

Ana C. Tuyama, Feng Hong, Alison D. Schecter, Arevik Mosaion, Benjamin K. Chen, Ping Chen, Mary E. Klotman, Meena B. Bansal; Medicine, Mount Sinai School of Medicine, New York, NY

**Introduction:** Patients co-infected with HIV/HCV develop more rapid fibrosis than patients mono-infected with HCV. Fibrosis progression correlates with HIV viremia suggesting a direct role of HIV in liver fibrogenesis. CCR5 and CXCR4 are the 2 major co-receptors required for HIV entry into cells. CCR5 has been reported on hepatic stellate cells (HSCs) and we have recently demonstrated the expression of CXCR4 on HSCs (Hong,#1400; AASLD 2007). Gp120 is the envelope protein for HIV and can activate cells independent of direct infection. The aim(s) of this study are to 1) Examine whether HIV enters HSCs and actively replicates 2) Characterize the impact of HIV gp120 on HSC biology. First the capacity of HIV IIIB (CXCR4-tropic or X4) and HIV-Bal (CCR5-tropic or R5) to infect HSCs was assessed by EUSA for supernatant p24, a marker for virus being released from the cells. LX2 cells, a human HSC line, were infected and washed to remove unbound virus. Significant concentrations of p24 (>2ng/ml) were detected on all days examined (up to 7 days). Since X4 viruses predominate later in the course of HIV disease coincident with chronic liver disease in patients with HCV/HIV, we examined whether HIV IIIB infects primary human HSCs (passage #3-4) and replicates using p24 assay and qRT-PCR for unspliced(US) and multiply-spliced(MS) HIV-1 RNA. The detection of p24 (>8ng/ml) associated with intracellular US and MS HIV suggests active replication (confirmed by sequencing of MS HIV-1). The ability of HIV to infect HSCs was confirmed by challenging the cells with a recombinant HIV expressing GFP in place of the early gene nef. The finding of GFP-positive cells indicates HIV entry and early gene expression. As HIV infection may be either CD4-dependent or -independent, CD4 expression by HSCs was documented by immunofluorescence. CD4-blocking experiments revealed that HIV IIIB entry into HSCs was CD4-independent.

**Conclusions:** HIV enters and actively replicates within HSCs independent of CD4. Both viral entry as well as exposure of cells to viral envelope glycoproteins can promote activation and collagen induction in HSCs. These results suggest that direct infection or Env-mediated activation of HSCs may contribute to rapid development of fibrosis in patients co-infected with HIV/HCV.

**Introduction:** Treatment options are limited for patients (pts) who are previous non-responders to Peg-IFN/RBV. Intensified treatment with higher fixed-dose induction of Peg-IFN and/or longer treatment duration may increase SVR rates in these pts. REPEAT compared both strategies in prior non-responders to...
≥12 wks of Peg-IFN α-2b (12KD, PegIntron®/RBV. Methods: Eligible pts were randomized [2:1:1:2] to 4 regimens, Arms A and B Peg-IFN α-2a (40KD; PEGASYS®) 360 μg/wk for 12 wks then 180 μg/wk for a further 60 or 36 wks, respectively; Arms C and D Peg-IFN α-2a (40KD) 180 μg/wk for 72 or 48 wks, respectively. All pts received RBV (COPEGUS®, 1000/1200 mg/day). The primary endpoint was SVR (HCV RNA <50 IU/mL 24 weeks post-treatment). Results: A total of 942 pts were randomized and dosed. Key baseline (BL) characteristics were similar across arms. For the protocol-defined primary analysis the SVR rate was higher for the 72-wk induction arm (Arm A: 16%) compared to the 48-wk non-induction arm (Arm D: 9%) [p=0.006, OR 2.00 (95% CI 1.21-3.31)]. Furthermore, SVR was higher for pooled 72-wk arms vs pooled 48-wk arms [p=0.0006, OR 2.22 (95% CI 1.40-3.52)]. Tolerability of induction and non-induction regimens of Peg-IFN α-2a were similar and overall the rate/type of AEs/SAEs were similar across arms. Discontinuation rates due to safety were lower for the 48-wks arms. Conclusion: In these difficult to cure pts with prior documented non-response to Peg-IFN α-2b/RBV, re-treatment with fixed-dose induction and longer duration with Peg-IFN α-2a (40KD)/RBV provided the highest SVR rates and the lowest relapse rates. Re-treatment with 72-wks of Peg-IFN α-2a provided higher SVR rates than 48-wks, irrespective of induction.

**TOTAL TUMOR VOLUME PREDICTS RISK OF RECURRENCE FOLLOWING LIVER TRANSPLANTATION IN PATIENTS WITH HEPATOCELLULAR CARCINOMA**

Christian Toso1, James F. Tratter2, Alice Wei3, David Bigam1, Shimul Shah3, Joshua Lancaster2, David Grant2, Paul Greig3, James Shapiro1, Norman Kneteman1; 1Department of Surgery, University of Alberta, Edmonton, AB, Canada; 2Division of Gastroenterology/Hepatology, University of Colorado Health Sciences Center, Denver, CO; 3Department of Surgery, Toronto General Hospital, University Health Network, Toronto, ON, Canada

Background: Criteria for selection of candidates for liver transplantation in the presence of hepatocellular carcinoma (HCC) should accurately predict post-transplant recurrence, while not excluding excessive numbers of patients from candidacy. Existing criteria are challenged by the limited accuracy of radiological assessment. Methods: Total Tumor Volume (TTV) was calculated by adding the volume of each individual tumor. A preliminary analysis was carried out on HCC patient data from the Alberta Liver Transplant Program (52 patients) and then validated on the populations of the Universities of Toronto and of Colorado programs (154 and 82 patients). Results: A TTV cutoff of 115 cm³ was chosen based on the risk of recurrence with use of a ROC curve. Radiology correlated more closely to pathology with TTV than with Milan and UCSF criteria (91 vs 69 and 75% of patients, p < 0.0001). While more patients met qualifying criteria for transplant with TTV, no deterioration of outcome were demonstrated on analysis of patients within TTV ≤ 115 cm³, in comparison to those meeting Milan or UCSF classifications at all institutions. Patients with TTV >115 cm³, experienced more recurrences and lower tumor-free survival in the Alberta and Colorado series (p < 0.005). Conclusions: Using Total Tumor Volume with a cut-off of 115 cm³ for candidate selection, the accuracy of pretransplant radiological assessment is enhanced, with post-transplant outcomes not different from those achieved with Milan and UCSF classifications despite a more inclusive patient population.

**HEREDITABILITY OF NONALCOHOLIC FATTY LIVER DISEASE**

Jeffrey B. Schwimmer1, Manuel Celedón1, Rany Salem2, Nicholas J. Schork2, Takeshi Yokoo3, Alyssa Chavez2, Michael S. Middleton2, Claude B. Sirlin3, 1Pediatrics, University of California, San Diego, San Diego, CA; 2Psychiatry, University of California, San Diego, San Diego, CA; 3Radiology, University of California, San Diego, San Diego, CA

Introduction: Nonalcoholic fatty liver disease (NAFLD) is the most common chronic liver disease in adults and children in the United States. Ethnic variability in the risk for NAFLD argues for a genetic component in the development of fatty liver. However, the impact of genetic factors in NAFLD is largely unknown. Therefore, we sought to determine the hereditability of NAFLD.

Methods: In order to test the hypothesis that NAFLD is highly heritable, children with biopsy-proven NAFLD (N=30) were recruited to serve as index cases. These probands had a mean age of 13 years with a mean BMI of 30 Kg/m². Family members age 8 and older were studied in a fasting visit. Anthropometric and laboratory studies were performed. Liver fat was quantified using in- and out-of-phase gradient echo magnetic resonance images (MRSI) obtained at 1.3T. Fatty liver was
defined as a fractional fat content ≥ 5%. Etiologies for fatty liver other than NAFLD were excluded (alcohol, Hepatitis C virus, and medications). Narrow sense heritability estimates for fatty liver were calculated using sequential oligogenic linkage analysis routines (SOLAR). Results: Family members (N = 93) of children with NAFLD had a mean age of 32 years (range 8-69) and mean BMI of 29 Kg/m2. Alanine aminotransferase (ALT) was abnormal in 40% of children and 25% of adults. Overall, fatty liver was present in 45% of siblings and 64% of adult family members. At least 1 case of NAFLD, beyond the index child, was identified in 84% of families. In 2 cases, previously unrecognized cirrhosis was detected by MRI. The unadjusted heritability of NAFLD was 56% (P=0.01). Adjusted for age, gender, and BMI, the heritability of NAFLD was 68% (P=0.01). Conclusion: Family members of children with NAFLD should be considered at high risk for NAFLD. The current data suggest that familial factors are the major determinant of whether an individual has NAFLD. Further family studies are needed to unravel the complex issues of the interaction of genes and environment in the development of NAFLD.

128 FRUCTOSE INDUCED HYPERURICEMIA AS A CAUSAL MECHANISM FOR NONALCOHOLIC FATTY LIVER DISEASE

Manal F. Abdelmalek, Ayako Suzuki, Cynthia Guy, Richard J. Johnson, Anna Mae Diehl, for the NASH Clinical Research Group, Division of Gastroenterology, Duke University, Durham, NC; Division of Nephrology, University of Florida, Gainesville, FL; NIDDK, National Institutes of Health, Baltimore, MD

The rise in obesity coincides with an increase in total fructose (FRU) intake. Excess FRU intake leads to hepatic increases in pyruvate and lactate production and a shift in balance from oxidation to esterification of fatty acids. Acute FRU loading of the liver causes sequestration of inorganic phosphate in FRU-1-phosphate and diminished ATP synthesis. Hepatic ATP depletion increases uric acid formation. FRU-induced hyperuricemia results in endothelial dysfunction and insulin resistance (IR) and may be a novel mechanism underlying NAFLD. Methods: We studied 341 adults enrolled in the NASH Clinical Research Network for whom dietary data using the Block Food Questionnaire was collected within 6 months of a liver biopsy. Total FRU consumption was estimated based on reporting (frequency x amount) of kool-aid, fruit juices, and non-dietary soda intake and expressed as servings per wk and classified into none, occasional (<7 servings/wk) and daily (≥7 servings/wk). Multiple linear and logistic regression analyses were used to analyze the association between FRU intake, hyperuricemia [serum uric acid (SUA) >5.5 mg/dl], HOMA-IR and the histologic features of NAFLD. Results: Of the 341 pts, 40% were male and 80% were Caucasian. The mean ± SD of age, BMI and caloric intake was 47 ± 12 yrs, 34 ± 6.3 and 1896 ± 957 kcal /day respectively. Overall, mean SUA was 6.2 ± 1.5 mg/dl, triglycerides (TG) was 196 ± 42 mg/dl, and total, HDL and LDL cholesterol was 196 ± 42 mg/dl, 44 ± 11 mg/dl and 120 ± 35 mg/dl respectively. Daily FRU intake was dose-dependently associated with hyperuricemia compared to non-consumers of FRU (p<0.002), even after controlling for total calorie intake and BMI: OR [95% CI] vs non-consumer was 2.4[1.1, 5.6], p=0.036. Elevated SUA was associated with high TG (p=0.0175), total cholesterol (p=0.008), and a trend towards low HDL cholesterol (p=0.06) which did not alter after controlling for HOMA-IR. On the other hand, even after controlling for other confounders, increased FRU intake was significantly associated with lower steatosis score but higher ballooning, inflammation, and fibrosis score (p<0.05 for each). However, SUA did not correlate with NAFLD Activity Score or fibrosis stage. Conclusions: Increased FRU intake is significantly associated with SUA. Elevated SUA is associated with altered lipid profiles independent of the severity of IR but not with histologic liver damage. However, increased FRU intake correlated negatively with steatosis and positively with ballooning and fibrosis stage. Whether increased FRU intake promotes NAFLD progression via the esterification of fatty acids and hepatic ATP depletion warrants further investigation.

129 DECREASED GM1 EXPRESSION IN MEMBRANE LIPID RAFT IN CD4 AND CD8 CELLS OF PATIENTS WITH NASH: A POTENTIAL BIOMARKER AND THERAPEUTIC TARGET

Gadi Lalazar, Ehud Zigmond, Ami Ben Ya’acov, Dan M. Livovsky, Ester Admon, Leah Gheber, Alexander Fich, Orit Pappo, Yaron Ilan; 1Liver Unit, Hadassah Hebrew University Medical Center, Jerusalem, Israel; 2Department of Gastroenterology, Ben-Gurion University of the Negev and Soroka University Medical Center, Beer sheva, Israel; 3Department of Clinical Biochemistry and Chemistry, Ben-Gurion University of the Negev, Beer sheva, Israel; 4Department of Pathology, Hadassah Hebrew University Medical Center, Jerusalem, Israel

The plasma membrane of lymphocytes contains sphingolipids and cholesterol, which cluster together in distinct domains called rafts. Lipid rafts have been shown to play a role in T cell activation. Altered lipid raft content may be associated with hyperactivation of immune cells associated with uncontrolled inflammation. GM1 a membrane-bound ganglioside is a main marker of lipid rafts. Current diagnosis of NASH includes serum liver enzymes and imaging studies, but the gold standard for diagnosis requires a liver biopsy. Aim: To compare the lymphocyte lipid raft GM1 content in human peripheral blood lymphocytes (PBLs) from patients with NASH and healthy controls. Methods: PBLs were harvested from five subjects with biopsy-proven NASH, and compared with three healthy controls. Cholera-toxin conjugated to FITC was used to stain GM1. Cells were sorted to CD4, CD8, and NKT lymphocyte subsets using FACS analysis. Plasma membrane lipid rafts were isolated using Triton X-100 insolubility assay. The lipid raft microdomains extracted from the plasma membrane, were identified by dot blot analysis for GM1. Disease activity was assessed via grading of liver biopsies for inflammation, steatosis and fibrosis and measurement of serum ALT levels. Results: Lipid rafts from CD4, CD8 but not NKT cells from patients with NASH, expressed significantly lower GM1 levels compared to healthy subjects (19.6%, 14.2%, 1.5%, 2.8%, 2.7% vs. 31.9%, 35.7%, 26.5% for CD4+FITC in NASH vs. healthy controls, respectively, and 6%, 7.1%, 2.2%, 2.3%, 3% vs. 33.3%, 38.3%, 9.78% for CD8+FITC, in NASH vs. healthy controls, respectively). Lipid raft microdomains from patients with NASH exhibited different GM1 partitioning patterns. GM1 was significantly expressed in the raft non-cytosolic fractions (numbers 1-5) in NASH patients, vs. higher expression in the cytosolic fractions (numbers 9-12) in healthy controls. In all NASH patients, alterations in CD4 and CD8 lymphocyte lipid rafts were associated with an increased inflammatory score, but not
with the degree of fibrosis or steatosis on liver biopsies and serum ALT levels. Conclusions: Patients with NASH exhibited altered lymphocyte lipid raft structure and lower GM1 expression. Alteration of GM1 expression in PBLs may serve as a non-invasive biomarker for disease activity and as a therapeutic target for these patients.

EFFECT OF BARIATRIC SURGERY ON NONALCOHOLIC FATTY LIVER DISEASE (NAFLD): A META-ANALYSIS
Rajasekhara r. Mummadi1, Krishna S. Kasturi2, Gagan Sood3; 1Gastroenterology & Hepatology, UTMB, Galveston, TX; 2Internal Medicine, UTMB, GALVESTON, TX
Background: NAFLD is widely prevalent in patients with morbid obesity. Effects of marked weight loss induced by bariatric surgery on histological features of NAFLD are unclear. Aim: To perform a systematic review and meta-analysis of the effect of weight loss after bariatric surgery on histological features of NAFLD. Methods: Electronic database (MEDLINE, EMBASE, Cochrane controlled trials register) were searched (1990 to 2007) for the studies that compared the histological features of NAFLD before and after bariatric surgery. A total of 42 studies were identified and 16 studies with adequate histological follow up were included for data extraction. Results: Total 762 patients, (81% F 19% M). Average time from surgery to second biopsy was 8 to 41 months. The most common weight loss surgery was RYGBP (8 out of 16) studies. The histological changes of NAFLD were seen in 558/762(72.33%). Overall in 456/568 an (80.28%) patient the changes of steatosis/steatohepatitis improved or resolved significantly and complete resolution of histological changes was achieved in 296/568(52.1%). In 17/568(2.9%) the inflammation progressed after surgery. A total of 268 biopsies showed evidence of fibrosis and among those 112/268(41.79%) showed improvement, 68/268(25.37%) remained the same and 44/268(16.41%) worsened. A pooled analysis of proportions using Random effects model (DerSimonian-Laird) of patients with complete resolution was 58.76% (95% CI = 42.68% to 73.94%). The studies were heterogeneous (I2=93%). Conclusions: Steatosis and necroinflammatory changes improve or completely resolve in majority of patients after bariatric surgery. There appears to be very low risk of progression of fibrosis or steatohepatitis.

DIFFERENTIAL HEPATIC EXPRESSION OF LUMICAN AND FATTY ACID BINDING PROTEIN-1 IN HISTOLOGICALLY PROGRESSIVE NAFLD – NOVEL POTENTIAL INSIGHTS INTO HISTOLOGICAL SPECTRUM OF DISEASE
Michael R. Charlton, Allard Jan Kalsbeek, Kimberly Viker, Anuradha Krishnan, Bart J. Veldt, Geoffrey Thompson, Florencia G. Que, Michael Sarr; Liver Transplant, Mayo Clinic, Rochester, MN
Background: The basis of hepatocellular injury and progressive fibrosis in a subset of patients with NAFLD is poorly understood. Recent advances in proteomic methodology have facilitated the detection of low abundance proteins in analyses of the hepatic proteome. Aims: To develop new insight into the pathogenesis of NAFLD by identifying hepatic proteins that are differentially abundant across the histological spectrum of NAFLD. Methods: The hepatic proteome was measured in liver samples from four groups of obese (BMI>30kg/m2), BMI and gender matched patients: 1) obese normal group (normal liver histology, n=10), 2) Simple steatosis (SS, n=10), 3) NASH-mild (steatosis, inflammation grade 1 and fibrosis stage 0-1, 4) NASH-progressive (as for NASH-mild but with fibrosis stage 2-4). iTRAQ LC/MS/MS analysis of peptides was performed on an API Qstar XL quadrupole time of flight mass spectrometer using Analyst QS software. Linear trends tests were performed and used to screen for differential abundance. Results: A total of 1362 hepatic proteins were identified. Nine known proteins were consistently differentially abundant between study groups. Seven proteins (albumin, hemoglobin beta, hemoglobin delta, dihydroxyrimidinase, enolase, metal transport protein ATX1 and HSP gp96) are likely to have been differentially abundant on a predictable basis. The other differentially expressed proteins were: 1) Lumican, a regulator collagen fibril assembly and activator of TGF-beta and smooth muscle actin. Lumican was overexpressed in a dose-dependent manner in NASH-mild vs. SS (124%, p<0.001), NASH-progressive vs. NASH-mild (156%, p<0.001) and NASH-progressive vs. obese normal (178%, p<0.001). 2) Fatty acid binding protein-1 (FABP-1) was appropriately relatively overexpressed in SS when compared
A randomized, double blind, placebo controlled trial of one year of pioglitazone in non-diabetic subjects with nonalcoholic steatohepatitis

Guruprasad P. Aithal¹, James A. Thomas², Philip Kaye¹,², Adam Lawson¹, Stephen D. Ryder¹, Andrew S. Austin⁴, Jan G. Freeman⁵, Linda Morgan⁵, Webber Jonathan⁵; ¹Wolfson Digestive Diseases Centre, University Hospital, Nottingham, United Kingdom; ²Histopathology, University Hospital, Nottingham, United Kingdom; ³Clinical Chemistry, Nottingham University, Nottingham, United Kingdom; ⁴Gastroenterology, Derby Hospital, Derby, United Kingdom; ⁵Diabetes Centre, Selly Oak Hospital, Birmingham, United Kingdom

Background: Nonalcoholic steatohepatitis (NASH) is a leading cause of chronic liver disease for which there is currently limited therapy. Thiazolidinediones have demonstrated some promise in treating NASH in diabetics. Their insulin sensitizing, anti-inflammatory and anti-fibrotic actions support their use in non-diabetic patients with NASH. Aim: To evaluate pioglitazone in the treatment of non-diabetic patients with NASH. Methods: We randomized 74 non-diabetic patients (45 male; median age 54 yr) with histologically proven NASH to 12 months of standard diet, exercise and either placebo or pioglitazone (30 mg/day). Of these, 61 patients (30 placebo, 31 pioglitazone) had liver biopsies both at the start and end of the study. Histological change was scored by a single pathologist who was blinded to all the information including the timing of the biopsy. Results: In the placebo group, diastolic BP (p<0.001) and ALT (p=0.016) decreased, while glucose (p=0.002), HbA1c (p=0.045) and serum markers of liver fibrosis (hyaluronic acid (p=0.012), tissue inhibitor of metalloproteinase (TIMP)-1 (p=0.008), aminoterminal propeptide of type III collagen (p=0.015)) increased over the study period. In the pioglitazone group, diastolic BP (p=0.02), transaminases (ALT & GGT p=0.001) and ferritin (p=0.016) decreased, while subjects gained weight (p=0.004) over the study period. Comparing the pioglitazone group against placebo, there was an increase in weight (+2.77 v -0.55kg, p=0.042) and reduction in glucose (p=0.021), HbA1c (p=0.006), insulin C peptide (p=0.015), ALT (p=0.009), GGT (p=0.002), ferritin (p=0.012), and TIMP-1 (p=0.015) associated with pioglitazone therapy. The histological changes during the study are summarised in the table. Conclusions: Pioglitazone therapy over a 12 month period in non-diabetic subjects with NASH resulted in improvements in metabolic and histological parameters, most notably liver injury and fibrosis. Larger extended trials are justified to assess the long-term efficacy of pioglitazone in this patient group.

detectable genotype 1 HCV RNA, and anti-HCV-seropositives with detectable genotype non-1 HCV RNA was 25.7% (7.3-90.9), 10.7 (3.3-34.6) and 11.3 (3.3-39.7), respectively, for those with ALT levels at entry >45 IU/L. The corresponding figures were 5.2 (2.2-12.0), 9.8 (5.3-18.2), and 7.5 (3.2-17.5) for those with ALT levels at entry <45 IU/L. **Conclusion:** HCV infection, elevated serum ALT levels, and cigarette smoking are important HCC risk predictors for HBsAg-seronegatives in Taiwan.

## 134 LOW UPTAKE OF TREATMENT FOR HEPATITIS C VIRUS (HCV) INFECTION IN A LARGE COMMUNITY-BASED COHORT OF ILICIT DRUG USERS IN VANCAYVER

Jason Grebely, Jesse D. Raffa, Calvin Lai, Mel Krajden, Benedikt Fischer, Thomas Kerr, Mark W. Tyndall

**Purpose:** To estimate HCV treatment uptake in a large community-based inner city cohort in Vancouver and compare this to the incidence of HCV infection over the period January 2000 to December 2004. Methods: CHASE is a cohort study of inner city residents recruited from January 2003 to June 2004. HIV and HCV status were determined through linkage with provincial databases. Treatment information was derived from the British Columbia Ministry of Health Pharmacare database (January 2000 to December 2004), which contains information on all HCV treatment prescriptions in the province. The incidence of HCV infection and the rate of HCV treatment uptake were calculated, expressed in terms of person-years of observation and compared over the follow-up period. Results: As of December 2004, among 3,553 subjects enrolled into the cohort, HCV antibody testing was performed in 2,117 and the HCV seroprevalence was 64.3% (n=1,361). In total, between January 2000 and December 2004, 15 HCV antibody positive subjects initiated treatment for HCV (1.1%), accounting for a total of 5420 person years of follow-up, yielding an overall treatment uptake of 0.3 cases per 100 person years (95% CI, 0.1-0.4). Overall, only 3 of 15 (0.2%) HCV antibody positive subjects achieved an SVR. During the same period, 91 HCV seroconversions were observed among a total of 1285 person years of follow-up, yielding an overall incidence of 7.1 cases per 100 person years (95% CI, 5.6-8.5). The incidence of HCV infection among recent injection drug users was 23.1 cases per 100 person years (95% CI, 17.5-28.5). Conclusions: We have documented extremely low rates of HCV treatment initiation and limited effectiveness of antiviral treatment for HCV, despite a high prevalence and incidence of infection in a large community-based cohort of inner city residents in Vancouver. Overall, the incidence of HCV was 24 times the rate of treatment uptake. Many studies have demonstrated that the treatment of this group is safe and effective, but the reality is that very few people in marginalized communities are accessing treatment for HCV. Given that the majority of new and existing cases of HCV occur in this group, efforts are urgently needed to expand programs for testing and treatment of HCV infection in illicit drug users.

Eric Rosenthal,1,10 Dominique Salmon,2 Charlotte Lewden,3 Fabrice Bonnet,4,10 Thierry May,5 Philippe Marlès,4,10 Muriel Français,3 Christine Burty,6, Eric Jouglar,9 Dominique Castagliola,7,8 Geneviève Chêne,1 Patrice Cacoub,5,10 Bonnet4,10, Thierry May,5, Philippe Morlat,4,10 Muriel François,3

**Objective:** To determine mortality due to end-stage liver disease (ESLD) and the profile of patients who died from ESLD in a nationwide population of HIV-infected patients and the evolution over a 10-years period. Design and methods: All departments of internal medicine and infectious diseases from the GERMIVIC Study Group prospectively recorded all deaths in HIV-infected patients during 2005. Fifty six departments, following around 35,000 HIV-infected patients, participated in the study. Results were compared with those of previous surveys conducted using similar methodology in 1995, 1997, 2001 and 2003. Results: Among 364 deaths documented during 2005, 142 (39.0%) were related to AIDS, 64 (17.6%) to ESLD, 55 (15.1%) to cancers neither related to HIV nor hepatitis viruses, 20 (5.5%) to cardiovascular diseases and 83 (22.8%) to other causes. Mortality due to ESLD represented 28.8% of non AIDS-related deaths. Patients dying from ESLD had chronic hepatitis due to virus C in 79.6% of cases and 46.6% of these patients had high alcohol consumption (> 30g/day) (table 1). In the Germivic survey, the proportion of ESLD-deaths has increased: 5% in 1995, 6.6% in 1997, 14.3% in 2001, 12.6% in 2003 and 17.6% in 2005, p<0.01. The proportion of hepatocellular carcinoma as a cause of death increased over this 10-years period (4.7% in 1995 vs 31.2% in 2005, p<0.01). Treatment of hepatitis C in patients who died from ESLD was more frequent in 2005 (37.5%) than in 1995 (19.0%). p<0.01. Conclusions: In HIV/HCV coinfected patients, the proportion of HCV/ESLD is still increasing and it constitutes a leading cause of mortality in this population.

136 STRONG ASSOCIATION BETWEEN TATTOOS AND HEPATITIS C VIRUS INFECTION: A MULTICENTER STUDY OF 3,871 PATIENTS

Sameer Dhalia1, Craig T. Tenner2, Ayse Aytaman3, Nilesh B. Shukla4, Gerald Villanueva5, Grace Punla6, Carlie Patterson7, JoAnn Comas8, Edmund J. Bini9

Methods: Patients with chronic HCV infection (HCV RNA positive) and controls (HCV antibody negative) completed a detailed questionnaire at the time of their scheduled visit to the outpatient primary care or GI clinic at 3 study sites. Data collected included patient demographics and information on HCV risk factors. Results: A total of 3,871 patients were enrolled, including 1,930 with chronic HCV infection and 1,941 HCV negative controls. There were no differences in the mean age (55.2 ± 9.0 vs. 55.6 ± 11.3 years, p = 0.34) or the proportion who were male (80.3% vs. 81.4%, p = 0.39) between HCV-infected patients and controls. However, HCV positive patients were more likely to be racial/ethnic minorities (78.5% vs. 56.5%, p < 0.001). As expected, injection drug use (63.9% vs. 17.8%, p < 0.001) and blood transfusions prior to 1992 (22.3% vs. 11.1%, p < 0.001) were more common in HCV-infected patients than in control subjects. Patients with HCV infection were significantly more likely to have had one or more tattoos (53.2% vs. 12.5%; OR = 3.81; 95% CI, 3.24 – 4.49; p < 0.001) and this remained highly significant after adjustment for age, sex, and race/ethnicity (OR = 4.57; 95% CI, 3.83 – 5.43; p < 0.001). After excluding all patients with a history of ever injecting drugs and those who have had a blood transfusion prior to 1992, a total of 1,887 subjects remained for analysis (466 HCV positive and 1,421 controls). Among these 1,887 patients without traditional risk factors for HCV infection, we found that HCV positive patients were still significantly more likely to have a history of tattoos (34.1% vs. 11.9%; OR = 3.84; 95% CI, 2.99 – 4.93; p < 0.001) and this remained highly statistically significant after adjustment for age, sex, and race/ethnicity (OR = 4.47; 95% CI, 3.42 – 5.83; p < 0.001). Conclusions: Tattoos are strongly associated with HCV infection, even among those without traditional HCV risk factors such as injection drug use and blood transfusions. All patients with tattoos should be offered HCV testing.

137 EVIDENCE OF INTERNATIONAL TRANSMISSION OF HCV IN PAN-EUROPEAN STUDY OF HIV-POSITIVE MEN WHO HAVE SEX WITH MEN (MSM)

Mark Danta1,2, Thijs van de Laar3, David Brown2, Oliver Pybus3, Sanjay Bhagani4, Martin Vogel5, Stefan Neifer6, Axel Baumgarten7, Helena Goltz8, Jurgen Rockstroh9, Sylvia Bruisten10, Geofrey M. Dusheiko11, 1St Vincent’s Clinical School, Sydney, NSW, Australia; 2Centre for Hepatology, University College and Royal Free Medical Schools, London, United Kingdom; 3Department of Zoology, University of Oxford, Oxford, United Kingdom; 4Department of HIV Medicine, Royal Free Hospital, London, United Kingdom; 5University of Bonn, Bonn, Germany; 6Practice Dupke, Carganico, Baumgarten, Berlin, Germany; 7Department of Infectious Diseases, Health Service, Rotterdam, Netherlands; 8Cluster of Infectious Disease, Health Service, Amsterdam, Netherlands

Since 2000, there has been a reported rise in percutaneous HCV transmission among European HIV-positive MSM related to high-risk sexual behaviours. We conducted a phylogenetic study to investigate the presence of a HCV transmission network among European MSM. Methods: HIV-positive MSM diagnosed with acute HCV (n=178) in England, Netherlands and Germany between January 2000 and December 2006 were enrolled into a molecular phylogenetic study. Part of the NS5B region of the HCV genome (436 bp) was amplified using RT-PCR and subsequently sequenced and genotyped. NS5B phylogenetic trees were constructed using MEGA 3.1 software, comparing MSM cases with unrelated NS5B sequences. Results: NS5B sequences were obtained from 154/178 (87%) of cases; UK 86/107 (80%); Netherlands 46/47 (98%); Germany 22/24 (92%). Circulating HCV strains were of subtype 1a (60%), 4d (23%), 3a (8%), 1b (6%), 2b and 2c (3%). Phylogenetic analysis revealed 10 distinct HCV clusters (containing between 3-36 individuals; bootstrap values >70%) involving 129 (84%) of the sequences. Six of the ten clusters contained sequences from more than one country; 3 clusters contained sequences from all three countries. The majority (66%) of HCV sequences were in the five largest clusters, all of which contained sequences from different countries. There was a trend to country specific segregation occurring in smaller clusters compared with country non-specific clusters (4.5 median sequences/cluster versus 13.5 median sequences/cluster, p=0.07). Conclusion: This phylogenetic analysis reveals a large HCV transmission network among HIV-positive MSM in
Europe. International mixing increases with cluster size, emphasising the rapid spread of regional outbreaks to neighbouring countries, presumably through increased travel associated with high-risk behaviours. The emergence of co-circulating HCV lineages supports transmission related to behavioural change among MSM rather than intrinsic viral change. This has important implications for public health agencies mitigating HCV transmission.

### 139 ANGIOTENSIN-CONVERTING-ENZYME 2 IS A NEGATIVE REGULATOR OF CHRONIC LIVER INJURY

Christoph H. Oesterreicher1, Ekihiro Seki1, Samuele De Minicis1, KOJIRO TAURA1, Melissa Penz-Oesterreicher1, Johannes Kluwer2, David A. Brenner1; 1Medicine, University of California, San Diego, CA; 2Medicine, Columbia University, New York, NY

Background: The renin-angiotensin system (RAS) plays a major role in liver fibrogenesis. The formation of angiotensin (ang) II and the ang II-induced effects in hepatic stellate cells (HSCs) are fibrogenic in the liver. Recently, a homologue of ang-converting-enzyme 1, named ACE2, has been identified that appears to be a negative regulator of the RAS by degrading ang II to ang 1-7. Interestingly, ACE2 expression and activity is increased in patients with chronic HCV infection. So far the role of ACE2 in liver disease remains elusive. Aims: To investigate the role of ACE2 in acute and chronic models of liver injury in vivo. Methods: ACE2 ko mice and wild-type (wt) littermates underwent bile-duct-ligation (BDL) for up to 21 days or received 1-8 injections of CCl4 and were sacrificed and analyzed at various time points. Liver pathology was analyzed by H&E and Sirius Red staining, immunohistochemistry, α-SMA immunoblotting and real-time PCR for collagen1(I), α-SMA and TIMP-1. Murine HSCs were isolated by collagenase-pronase perfusion and Nycodenz gradient centrifugation Results: After 21 days of BDL, ACE2 ko mice displayed a 2.5 fold increase in Sirius Red positive area as well as increased α-SMA protein levels compared to wt siblings. Livers of ACE2 ko mice were characterized by inflammatory cells infiltrating and increased expression of lipid peroxidation products. Collagen1(I), α-SMA, and TIMP-1 mRNA levels were significantly higher in ACE2 ko mice compared to wt littermates. Similar results were obtained from mice receiving 8 injections of CCl4. In contrast, ACE2 ko mice undergoing BDL for 5 days or receiving a single injection of CCl4 did not differ from their wt littermates with respect to serum ALT or AST levels or mRNA expression of collagen1(I), α-SMA or TIMP-1. Real-time PCR analysis revealed that ACE2 mRNA is significantly upregulated after 3 weeks of BDL or 8 injections of CCl4 in contrast to ACE1 mRNA which is already significantly increased 5 days after BDL or 1 injection of CCl4. Interestingly, 1 year old untreated ACE2 ko mice displayed inflammatory cell infiltration and collagen deposition. Finally, HSCs expressed the ang 1-7 receptor MAS, and ang 1-7 inhibited the activation of cultured HSCs by ang II. Conclusion:
140 REDUCED HEPATIC FIBROSIS IS ASSOCIATED WITH FEWER INTRAHEPATIC B CELLS IN FIBROBLAST ACTIVATION PROTEIN AND DIPEPTIDYL PEPTIDASE IV GENE KNOCKOUT MICE

Xin M. Wang1, Shaun Cordoba1, Didier Marguet2, Wolfgang Retting3, Andreas Schnapp2, Geoff W. McCaughan1, Mark D. Gorrell1; 1Centenary Institute, Faculty of Medicine, University of Sydney, Sydney, NSW, Australia; 2Boehringer Ingelheim, Vienna, Austria; 3Inserm, Paris, France

Cell adhesion and migration are essential in pathologic processes that involve wound healing, such as chronic liver disease. Fibroblast activation protein (FAP) and dipeptidyl peptidase IV (DPIV) are type II cell surface proteins of the prolyl oligopeptidase gene family but both proteins have soluble forms in human serum. FAP has both peptidase and collagen type I specific gelatinase activities. DPIV binds to fibronectin and both proteins bind beta 1 integrin and influence cell-extracellular matrix interactions in vitro (X.M. Wang et al. Hepatology 2005;42:935). In chronic liver injury, FAP is selectively expressed by activated hepatic stellate cells (HSC) and myofibroblasts and the expression level correlates with fibrosis severity. The role of DPIV in metabolic regulation has been exploited by a new type 2 diabetes therapy that selectively inhibits the peptidase activity of DPIV. To further investigate the roles of FAP and DPIV in liver fibrosis, chronic liver injury was induced in wild type, FAP gene knockout (gko) and DPIV gko mice by carbon tetrachloride (CCL4) injection. The level of liver fibrosis was quantified by Sirius red staining and automated Axiovision v.4.3 – assisted image analysis. Inflammation was assessed using both H&E staining and CD45 immunostaining. Frozen sections were immunostained for desmin, GFAP, alpha SMA, CD4, CD8, B220 and F4/80 expression. Immunostained cells were counted in 20 adjacent fields under a 20x objective by fluorescence microscopy. Global intrahepatic gene expression at 3 weeks of CCL4 treatment was measured by DNA microarray and quantitative PCR. Statistical analyses used Student’s t test. Both FAP and DPIV gko mice developed less liver fibrosis and less inflammation compared with the wild type mice (p<0.05). DNA microarray detected 22 genes up-regulated and 172 genes down-regulated in DPIV gko fibrotic mice and 12 genes up-regulated and 37 genes down-regulated in DPIV gko fibrotic mice, compared to fibrotic wild type mice. Quantitative PCR confirmed that some cell-ECM and metabolism-associated genes were differentially expressed. Most of the down-regulated genes were immunoglobin genes. Reduced fibrosis severity was associated with reduced intrahepatic B cell densities, as has been reported by Novobrantseva et al. (J Clin Invest 2005, 115:3072). Fewer CD4+ cells were seen in DPIV gko (p<0.05) but not FAP gko livers. No differences in HSC, CD8+ or macrophage numbers were detected. The data suggest pro-fibrotic roles for FAP and DPIV in experimental chronic liver injury. Future work should investigate interactions between FAP and B cells in the development of liver fibrosis.

141 GHRELIN ATTENUATES ACUTE AND CHRONIC HEPATIC INJURY IN RATS AND INFLUENCES FIBROSIS PROGRESSION IN PATIENTS WITH CHRONIC HEPATITIS C

Montserrat Moreno1, Javier F. Chaves2, Pau Sancho-Bru1, Fernando Ramalho3, Leandra N. Ramalho1, Josep Vidal3, Xavier Forns1, Montserrat Mari3, Maria L. Mansego2, Albert Morales3, Jordi Colmenero1, Marlene Dominguez1, Vicente Arroyo1, Juan Caballeria1, Pere Gines1, Ramón Bataller1; 1Liver Unit, IDIBAPS, CIBER, Hospital Clinic de Barcelona, Barcelona, Spain; 2Laboratorio de Estudios Genéticos, Fundación de Investigación, Hospital Clínico Universitario de València, Valencia, Spain; 3Consejo Superior de Investigaciones Científicas, Barcelona, Spain; 4Endocrinology Unit, Hospital Clinic de Barcelona, Barcelona, Spain

Background&Aims: Ghrelin is a gut-derived hormone with powerful orexigenic properties. Ghrelin is also expressed in some peripheral organs, and exerts pleiotropic effects such as protection of parenchymal cells against cell death. The aims of this study were to study whether ghrelin is expressed in the liver and regulates the hepatic response to acute and chronic injury. Methods: Ghrelin gene expression was assessed by quantitative PCR in normal livers (n=5), alcoholic hepatitis (n=22) and chronic hepatitis C (n=13). Serum ghrelin levels were analyzed by RIA in healthy subjects (n=34); alcoholic hepatitis (n=25) and chronic hepatitis C (n=73). Recombinant ghrelin or saline were administered to rats with acute liver injury (single CCl4 administration) and rats with liver fibrosis (bile duct ligation). The effects of ghrelin were also studied in primary cultures of hepatic stellate cells (HSC) and hepatocytes. Six SNPs of the ghrelin gene were analyzed in 266 patients with chronic hepatitis C infection with mild and advanced fibrosis. Results: Ghrelin gene expression was detected in both normal and diseased livers. Ghrelin serum levels were decreased in patients with chronic liver diseases and correlated with the degree of fibrosis. Recombinant ghrelin markedly attenuated the fibrogenic response of rats to chronic injury, as assessed by decreased collagen deposition (morphometric quantification of the area stained with Sirius Red), accumulation of αSMA-positive cells and expression of procollagen αI(III), TGFβ1 and TIMP-1. These effects were reproduced in cultured HSC. The anti-fibrotic effects of ghrelin in vivo and in vitro were prevented by the use of a ghrelin receptor antagonist. Ghrelin also protected rat livers from acute liver injury, as indicated by reduced serum levels of AST, necroinflammatory score, infiltration by CD43-positive inflammatory cells, hepatocellular apoptosis (TUNEL) and oxidative stress (HNE). Ghrelin also stimulated pro-survival signaling pathways in cultured hepatocytes. Finally, we studied whether ghrelin gene variations regulate fibrosis development in patients with chronic hepatitis C. Two SNPs of the ghrelin gene (9974CT and -604GA) influenced the degree of liver fibrosis in female patients with chronic hepatitis C. Conclusions: We conclude that ghrelin attenuates liver fibrosis and hepatocellular injury and it may influence the progression of liver fibrosis in patients with chronic hepatitis C. Therefore, ghrelin could be a potential therapeutic agent for patients with liver diseases.

COMPETITIVE INHIBITION OF LEPTIN SIGNALING BY A MUTAGENIC PEPTIDE RESULTS IN IMPROVEMENT OF HEPATIC FIBROSIS THROUGH INHIBITION OF HEPATIC STELLATE CELL ACTIVATION
Eran Elinav1, Rafi Bruck1, Muhammed Ali1, Eli Brasowski1, Adam Phillips1, Zamir Halpern1, Arieh Gertler2; 1Tel Aviv Sourasky Medical Center, Tel Aviv, Israel; 2Faculty of Agriculture, Hebrew University, Rehovot, Israel

Background: Leptin signaling is required for hepatic stellate cell pro-fibrotic function. In leptin deficient ob/ob mice, fibrosis does not develop despite the presence of severe longstanding steatohepatitis, while administration of leptin to ob/ob mice results in development of fibrosis and exacerbation of existing fibrosis in wildtype mice. Aims: Assessment of the effect of competitive inhibition of leptin signaling on chronic liver fibrosis. Methods: A mutated leptin protein carrying four substituted amino acids at the leptin receptor binding site III was generated by site-directed mutagenesis. This mutated molecule was found to potently bind leptin receptor, but does not induce intra-cellular signaling events. The anti-leptinogenic and anti-fibrotic activity of the leptin mutant was assessed using various in-vitro systems, while leptin antagonist’s in-vivo effect on liver fibrosis was assessed using the chronic thioacetamide (TAA) chronic inflammation and fibrosis model. Results: The mutated leptin protein was found to potently inhibit leptin-induced phosphorylation of STAT3 and MAP kinase, and leptin-induced oligomerization of leptin receptors. In the chronic TAA fibrosis model, leptin administration was associated with significantly enhanced liver disease leading to a 100% 5-week mortality rate. In contrast, administration of inhibitory doses of leptin antagonist alone or in concomitantly with leptin was associated with markedly improved survival and reduced chronic liver inflammation and fibrosis. No significant changes in weight, serum cholesterol or triglycerides were noted. In-vitro addition of leptin antagonists to hepatic stellate cells was associated with reduced PDGF-induced proliferation. To prove leptin antagonist’s inhibitory effect on HSC’s profibrogenic function, HSC’s were transiently transfected with a bicistronic vector encoding alpha 1 procollagen promoter and luciferase as a reporter gene. Incubation with leptin antagonists was associated with significant reduction in luciferase luminescence, reflecting inhibition of leptin-induced activation of alpha 1 procollagen expression. Conclusion: Inhibition of leptin’s activity by a mutated peptide results in potent inhibition of chronic inflammation and fibrosis, partly through inhibitory effects on hepatic stellate cell activity. Inhibition of leptin’s activity may hold promise as a future anti-fibrotic therapeutic modality.

INTEGRIN ALPHAV BETA 6 IS A UNIQUE PROGRESSION MARKER AND TARGET FOR ANTIFIBROTIC THERAPIES IN LIVER FIBROSIS
Yury Popov1, Jessica Zaks2, Killimangalam Bhaskar1, Eleonora Patsenker, Gerald Niedobitek, Armin Kolb, Helmut Friess, Detlef Schuppan1

1Gastroenterology, Beth Israel Deaconess Medical Center, Boston, MA; 2Clinical Pharmacology, University of Bern, Bern, Switzerland; 3Institute of Pathology, University of Erlangen, Erlangen, Germany; 4General Surgery, University of Heidelberg, Heidelberg, Germany

Background: The integrin αvβ6 promotes proliferation and wound healing of specialized epithelial cells and acts as a receptor for the activation of latent TGF-β1. Since molecular targeting of this integrin could serve as a novel strategy to treat hepatic fibrosis, we studied αvβ6 expression in experimental and human liver fibrosis and its pharmacological inhibition for treatment of liver fibrosis. Materials and methods: αvβ6 expression was studied by quantitative PCR and immunohistochemistry in rats with cirrhosis due to bile duct ligation (BDL), chronic administration of thioacetamide (TAA), in Mdr2(abcb4)-/- mice that develop progressive biliary fibrosis, and in 18 explant livers of patients who underwent liver transplantation for end-stage liver disease due to HBV, HCV, PBC, PSC and alcohol. The effect of the selective αvβ6 inhibitor EMDS27040 was evaluated in Mdr2(abcb4)-/- mice with advanced hepatic fibrosis. Results: Integrin αvβ6 mRNA was upregulated 25- and 90-fold in TAA- and BDL-induced cirrhosis, respectively, and up to 85-fold in Mdr2(abcb4)-/- mice in correlation with fibrosis progression. In human end-stage liver disease αvβ6 transcripts were up to 100-fold upregulated, with no association to the underlying disease. αvβ6 protein was almost absent in normal livers and expressed de novo on (activated) bile duct epithelia and transitional hepatocytes adjacent to fibrous septa. A single dose of EMDS27040 into Mdr2(abcb4)-/- mice resulted in a transient 40% downregulation of profibrogenic transcripts (procollagen 1, MMP-2, TGFβ2) and a transient 3-fold induction of a pro-fibrolytic transcripts (MMP-8, -9, -13), paralleled by increased extracellular matrix-degrading activities in the liver 3h after injection. Conclusions: 1) Integrin αvβ6 is highly upregulated in rodent and human liver fibrosis, where it is expressed on bile duct epithelia and (transitional) hepatocytes and correlates with fibrosis progression. 2) In vivo a single dose of a small molecule αvβ6 inhibitor modifies hepatic gene expression and enzymatic activities in an antifibrogenic and profibrolytic fashion, confirming αvβ6 integrin as a unique target to monitor and treat liver fibrosis.

144
REGRESSION OF FIBROSIS AMONG LONG-TERM RESPONDERS TO ANTIVIRAL TREATMENT FOR CHRONIC VIRAL HEPATITIS
Cosimo Colletta1, Carlo Sinirne2, Carlo Fabris3, Anna M. Foscolo4, Pierluigi Toniutto5, Rachele Rapetti5, Rosalba Minisini5, Lisa Sala5, Stefano Fangazio5, Mario Pirisi1; 1Division of Medicine, COQ, Omegna, Italy; 2Dpt of Clinical & Experimental Medicine, University of Eastern Piedmont, Novara, Italy; 3DPMSC, University of Udine, Udine, Italy; 4Pathology, ASL 14, Verbania, Italy

Introduction. Evidence of fibrosis regression among long-term responders to antiviral treatment for chronic viral hepatitis B and C is scanty, since, for a variety of reasons, liver biopsy is rarely performed on these patients. We aimed to estimate the degree of long-term improvement in necroinflammatory and fibrosis scores after successful antiviral treatment of chronic viral hepatitis, and to verify whether hepatic ultrasonic transient elastography might be a reliable non-invasive alternative to liver biopsy in these patients. Methods. One-hundred one patients (70 males, median age 52 years, range 34-68), who had undergone percutaneous liver biopsy prior to antiviral treatment for chronic hepatitis C (N. = 78) or B (N. = 23), and had achieved sustained viral response or persistent viral suppression, respectively, were studied. A second liver biopsy was performed a median of 76 months (range, 35 to 113) after the index biopsy; all biopsy specimens were scored according to the method of Ishak et al. Within 24 hours from this second
biopsy, liver stiffness was measured by hepatic ultrasonic transient elastography. Results. In the Table, initial and final grading and staging scores are summarized according to the viral agent involved. The grading and staging scores observed at the end of follow-up were significantly lower than to those observed prior to antiviral therapy (p ≤ 0.0001 for both). The mean reductions in the grading scores were 4.2±3.1 in hepatitis C patients vs. 4.8±2.5 in hepatitis B patients (p: NS). The mean reductions in the staging scores were 2.9±1.1 in hepatitis C patients vs. 3.0±1.0 in hepatitis B patients (p: NS). The individual final staging scores were always lower than the initial staging scores; none of the patients had a final staging score >2. Liver stiffness was 4.7±0.8 kPa in the 72 patients with final staging score = 0; 7.6±0.7 kPa in the 27 patients with final staging score = 1; and 8.9±0.1 in the two patients with final staging score = 2. Conclusions. Achievement of virologic end-points is accompanied, in the long term, by significant improvements in the necroinflammatory and fibrosis scores both in hepatitis B and C. Transient elastography may reliably substitute liver biopsy to confirm fibrosis regression in this setting.

146 CHRONIC HBV EVOLUTION IS ASSOCIATED WITH NUMERIC AND PHENOTYPIC CHANGES IN PERIPHERAL HBV-CORE EPITOPE SPECIFIC CD4+ T-CELLS: A STUDY USING A NOVEL HBV-CORE SPECIFIC HLA-DRB1*0101 TETRAMER FOR THE ANALYSIS OF ANTIVIRAL CD4+ T-CELL RESPONSES DURING ACUTE AND CHRONIC HEPATITIS B

Malte H. Heeg1,2, Axel Ulsenheimer1,2, Norbert H. Gruener1,2, Helmut M. Diepolder1,2, Winfried Schraut1,2, Martin Wachter1,2, Reinhart Zachoval1,2, Gerd R. Pape1,2, Maria C. Jung1,2,1,2,1 Dept. of Medicine II, LMU Munich, Munich, Germany; 2 Dept. of Immunology, LMU Munich, Munich, Germany; 3 Hospital Munich-Schwabing, Munich, Germany

A strong HBV-specific CD4+ T cell response is associated with spontaneous viral clearance in acute hepatitis B but is weak or short-lived in patients developing chronic disease. So far, this CD4+ T cell response could just be investigated by functional assays which lack the possibility of further T-cell phenotyping and that are unable to identify dysfunctional cells. HBV-specific HLA-class-II tetramers now can negotiate those limitations. To establish a new HBV-core MHC-class-II tetramer we screened 33 patients with acute HBV infection by overlapping HBV-core peptides and identified a HLA-DRB1*0101 restricted HBV-core epitope. This epitope was recognized by all DRB1*0101 patients with acute HBV infection as well as by 77 % (17/22) of all patients with acute HBV. Using this epitope we assembled a new DRB1*0101 MHC-class-II tetramer. The tetramer specifically stained a corresponding CD4+ T cell clone. To proof the tetramer sensitivity dilution experiments of Tet+ clone cells into PBMC were performed and a strong correlation between added and measured frequencies was found. In six HBV-negative DR1+ individuals and nine patients with acute hepatitis B lacking DR1, no CD4+ cells were tetramer positive. In three HLA-DR1+ patients with acute hepatitis B, HBV-specific CD4+ T cells were detectable during the acute phase of disease, ranging from 900 to 1680/106 CD4+ T cells during the peak phase. The peak phase was associated with an A Th peak and viral clearance as well as with a peak level of IFN-γ secretion. The frequencies of HBV specific CD4+ T-cells decreased rapidly after viral clearance but were detectable in considerable levels over several months. In contrast, at different time points of disease 15 investigated patients with chronic hepatitis B showed demonstrate that cross-presentation by LSEC leads to CD8 T cell tolerance in vivo characterized by lack of cytokine expression and lack of in vivo cytolysis. Our findings suggest that T cell tolerance towards circulating antigens is not primarily induced by tolerogenic DC, but rather results from rapid antigen-specific hepatic retention of naive CD8+ T cells by cross-presenting scavenger LSEC. Although tolerant T cells redistributed in the entire organism, LSEC-induced tolerance remained dominant over restimulation of T cells in lymphatic tissue by dendritic cells. This identifies intra-hepatic naive T cell sequestration as the first step in peripheral CD8+ T cell tolerance towards circulating antigen. LSEC constitute the key cell population combining extraordinary scavenger activity with the capacity of cross-presentation and antigen-specific retrieval of naive CD8+ T cells from the circulation for subsequent induction of non-deleterious tolerance. These mechanisms may be amenable to therapeutic manipulation in order to influence autoimmunity or persistence of viral infection.

145 CROSSPRESENTING LSEC PROMOTE LIVER-SPECIFIC NAIVE CD8 T CELL RETENTION AND TOLERANCE IN VIVO

Nanette von Oppen1, Anna Schurich1, Rene Tolba2, Linda Diehl1, Percy Knolle1; 1 Molecular Medicine, University of Bonn, Bonn, Germany; 2 House for Experimental Therapy, University of Bonn, Bonn, Germany

Systemically circulating antigen in the absence of inflammation does not cause immunity but tolerance. Likewise, circulating viral antigens may skew virus-specific CD8+ T cell immune responses promoting viral immune escape. Here we demonstrate in a murine system that organ-resident liver sinusoidal endothelial cells (LSEC) but not dendritic cells scavenge circulating antigens from the blood. Subsequently cross-present of circulating antigens by LSEC caused rapid liver-selective and antigen specific retention of naive CD8+ T cells as evidenced by intravital microscopy. Generation of bone-marrow chimeras, where only organ-resident LSEC but not bone-marrow derived immune cells cross-presented circulating antigens to naive CD8 T cells, clearly revealed together with the extraordinary scavenger function for circulating antigens the decisive role of LSEC in antigen-specific hepatic retention of naive CD8 T cells. Using these bone-marrow chimeras as a novel model system we
no or only very low frequencies of tetrameric positive cells. During the course of acute self limiting hepatitis B, phenotypic characterization demonstrated a rapid increase of IL7R and CD62L expression on Tet+/CD4+ T-cells. In conclusion, using a new MHC-class-II tetramer containing one immunodominant HLA-DRB1*0101 restricted epitope within HBV-core, we were able to quantify and characterize HBV specific CD4+ T cell responses patients with acute hepatitis B and chronic hepatitis B. In patients with chronic disease almost no Tet+/CD4+ T-cells were found indicating a complete loss of antiviral CD4+ T-cells rather than a loss of function of those cells. Furthermore those cells showed an impaired capacity to develop a memory phenotype. So far tools which allow to distinguish between the absence of specific cells or their non-function were not available.

147 A NOVEL THERAPEUTIC HBV VACCINE INDUCES POTENT SURFACE- AND CORE-SPECIFIC IMMUNOGENICITY IN MICE, RHESUS MACAQUES AND HBV TRANSGENIC MICE

Jason D. Marshall1, Marianne L. Gesner1, Darren S. Heeke1, Pascale Buchmann2, Eduardo Martins1, Brian D. Livingston1, Karl Melber2, Gary Van Nest1; 1Dynavax Technologies, Berkeley, CA; 2Dynavax Europe, Dusseldorf, Germany

HBV infects approximately 350 million people worldwide, and carriers are at increased risk for cirrhosis and hepatocellular carcinoma. Current HBV therapies do not eradicate HBV and have limited long-term efficacy. We have developed a novel immunotherapeutic vaccine for treatment of chronic HBV infection. The vaccine, composed of HBsAg (HBV surface antigen), HBeAg (HBV core antigen) and a proprietary adjuvant, was designed to induce virus-specific cellular immune responses such as are typically correlated with HBV clearance. Mice immunized with the vaccine exhibited robust cellular and humoral immune responses to both HBeAg and HBsAg. The vaccine induced HBV-specific cell-mediated immunity in both CD4 and CD8 compartments. The total CD8-restricted T cell responses, including antigen-restricted responses directed against both HBeAg and HBsAg (as high 500 SFC/106 cells) were demonstrated using IFN-γ ELISPOT assays. Additionally, CTL lytic activity as measured by Granzyme B release was observed in response to HBeAg and HBeAg peptides. The vaccine also elicited strong anti-HBsAg and anti-HBeAg immunoglobulin responses in both IgG1 and IgG2a isotypes. In rhesus macaques, immunization induced antigen-specific T cells at frequencies as high as 1000 SFC/106 PBMC. These T cells secreted IFN-γ and IL-2 in response to stimulation with either HBeAg or HBeAg peptides in ELISPOT assays. Treated rhesus also exhibited anti-HBsAg IgG levels, greater than 105 mIU/mL after two immunizations. As a model for chronic hepatitis, we are conducting studies of HBV transgenic mice to examine the effect of this vaccine on viral replication, seroconversion, and generation of HBV-specific T cell responses. Preliminary results indicate that the vaccine is effective in breaking immune tolerance, inducing HBV-specific T cell responses and high anti-HBsAg levels simultaneously with a vigorous multivalent cell-mediated T cell response. These data suggest this dual-antigen immunotherapeutic vaccine may be valuable in the treatment of chronic HBV infection. Currently, this vaccine is being tested in Phase 1 human clinical trials.

A COMBINATION OF BETA-GLYCOLIPIDS OVERCOMES
A CD1D DEPENDENT INHIBITION OF NKT LYMPHO-
CYTES: AN ALTERNATIVE FLOTILLIN-2 RAFT PROTEIN-
DEPENDENT REGULATORY CELL ACTIVATION PATHWAY
Gadi Lalazar, Ami Ben Ya’acov, Dan M. Livovsky, Sarah Preston, Yaron Ilan; Liver Unit, Hadassah Hebrew University Medical Cen-
ter, Jerusalem, Israel

CD1-restricted natural killer T (NKT) cells are regulatory lymphocytes that co-express a conserved T-cell and natural killer (NK) receptors. Lipid rafts are highly dynamic, submicroscopic assemblies enriched in sphingolipids and cholesterol. CD1d, a raft-localized receptor, is an essential restriction element in raft glycolipid-mediated activation. Lipid raft disruption inhibits NKT cell activation but does not interrupt ligand loading onto CD1d, in contrast to direct blocking of the CD1d receptor by a monoclonal antibody. Raft disrupters were shown to inhibit IL-
6/STAT3 and IFN-γ/STAT1 signaling suggesting that almost all signaling by these cytokines is initiated in raft microdomains. Purpose: To determine the signaling pathway of NKT activation using naturally occurring beta glycolipids, and its dependence on the CD1d membrane receptor. Methods: NKT hybridoma cells (DN32.D3) were stimulated in vitro using 500ng/ml of beta-glucosylceramide (GC), beta-lactosylceramide (LC), or a 1:1 combination of both (IGL), or PBS. The detergent-insoluble membrane complexes were floated on nycodenz gradient and their GM1 content was analyzed by dot blot. NKT signaling pathway was assessed using western-blot analysis of FLOTILLIN-2, LCK STAT1 and 3. NKT activation was measured using a 3[H] thymi-
dine incorporation assay. To determine the effect of CD1d on the signaling pathway, anti-CD1d monoclonal blocking anti-
bodies were used. Results: Administration of IGL led to a more prominent flotilltin-2 recruitment to the raft fractions (1-2) compared with GC, LC and PBS. No effect was noted on LCK and GM1 in all treatment groups. All glycolipids led to a significant increase in STAT1 expression in the cytosolic factions (8-12), but STAT3 expression was prominent for IGL only. Administration of IGL, resulted in stimulation of NKT cell proliferation, in contrast with an inhibition with GC or LC alone (increase by 18%, versus a decrease by 3% and 10%, respectively, p<0.05). The addition of anti CD1d antibodies resulted in increased cell proliferation for GC, LC, IGL compared with PBS (13%, 27%, and 12% respectively, p<0.05). Conclusion: Administration of the combination of beta-glycolipids, IGL over-
comes the CD1d dependent inhibition of NKT activation by nat-
urally occurring beta glycolipids. An alternative membrane raft FLOTILLIN-2 mediated pathway may be an important mechanism for the effect of these novel compounds on regulatory cells. These data suggest that IGL may serve as a novel immune mod-
ulator in NKT mediated liver disease.

NATURAL KILLER DENDRITIC CELLS ARE A DISTINCT
CLASS OF HYBRID DENDRITIC CELLS WITHIN THE
MURINE LIVER NK1.1+ CELL POPULATION
Bryan M. Burt, George Plitas, Jennifer A. Stablerford, Hoang M. Nguyen, Ronald P. DeMatteo; Hepatobiliary Surgery, Memorial Sloan-Kettering Cancer Center, New York, NY

Introduction: Natural killer dendritic cells (NKDC, NK1.1+CD1c+CD3-) are a novel subtype of dendritic cells (DC, NK1.1+CD1c+CD3-) that share with natural killer cells (NK cells, NK1.1+CD1c+CD3) the ability to lyse tumor cells and produce copious amounts of interferon-gamma (IFN-γ). The study of NKDC has thus far been limited to the spleen and the function of NKDC in the liver is unknown. We hypothesized that liver NKDC are the dominant IFN-γ producing DC in the liver and participate in the defense against viral and bacterial hepa-
ritis. Methods: Five color flow cytometry was used to study NKDC in the livers of naive C57BL/6 mice and in mice infected intravenously with 5 x 10¹⁰ particles of unattenuated human adenovirus type 5 (Ad, viral hepatitis model) or 1 x 10⁷ CFU of Listeria monocytogenes 10403S (LM, bacterial hepatitis model). For functional assays, liver NKDC were purified with fluorescence-activated cell sorting. Results: NKDC comprised 39 ± 5% of hepatic NK1.1+CD3 cells and were equally as prevalent as classical liver DC (NK1.1+CD1c+CD3). Liver NKDC had unique cellular morphology and a resting surface phenotype resembling both activated NK cells and immature DC. Liver NKDC were potent lytic cells effecting greater lysis of YAC-1 lymphoma cell targets than liver NK cells; this activity was dependent upon the effector molecule perforin. In vitro, liver NKDC had the capacity to stimulate allogeneic T cells in a mixed leukocyte reaction when activated with the toll-like recep-
tor 9 ligand CpG. In vivo, liver NKDC were able to prime anti-
gen specific CDF T cells in a mouse footpad model. The combination of CpG and IL-18 stimulated liver NKDC to secrete large amounts of IFN-γ in vitro whereas NK cells produced only low levels (55.1 ± 8.0 vs. 1.3 ± 0.6 ng/ml). In response to hepatic infection in vivo, liver NKDC expanded (17-fold with Ad and 8-fold with LM) and upregulated surface expression of natural killer receptors Ly49D and Ly-49C/1 as well as DC cos-
timulatory molecules MHCIi, CD40, CD80, and CD86. Using intracellular cytokine analysis, we determined that liver NKDC respond to viral and bacterial hepatitis by producing IFN-γ and were the dominant producers of IFN-γ in Ad-infected animals 48 hours post infection. Similar experiments performed in IL-12-/ / and IL-18-/ / mice demonstrated that the production of IFN-γ by NKDC was dependent upon these cytokines. Conclusion: Liver NKDC are a distinct component of the hepatic immune system. These multifunctional cells are the principal IFN-γ producing DC of the liver and play an important role in the innate immune response to viral and bacterial hepatitis.

RAS/P13-K/ Akt PROMOTES CELLULAR GROWTH BY
ENHANCING ALTERNATIVE SPlicing-MEDIATED
INACTIVATION OF THE KL6 TUMOR SUPPRESSOR IN
HUMAN HEPATOCELLULAR CARCINOMA
Steven Yea, Goutham Narla, Xia Zhao, Augusto Villanueva, John A. Martignetti, Josep M. Llovet, Scott L. Friedman; Mount Sinai School of Medicine, New York, NY

Background & Aims: Hepatocellular carcinoma is the fifth most prevalent cancer worldwide and the third most lethal. Dysregu-
lation of alternative splicing underlies a growing number of
human neoplasms, yet its contribution to HCC has not been explored. The KLF6 tumor suppressor is a zinc finger transcription factor that inhibits cellular growth by either transcriptional activation of p21, antagonism of c-jun, and/or sequestration of cyclin D1. KLF6 function is abrogated in several human cancers due to increased alternative splicing that yields a dominant negative isoform, ‘KLF6 SV1’, which antagonizes full length KLF6 (‘KLF6Full’) mediated growth suppression. The molecular basis for increased KLF6 splicing is unknown. Methods & Results: KLF6 isoform-specific qRT PCR was developed to quantify KLF6 alternative splicing in human cell lines and tissues. In 67 human HCCs, there was a significant correlation (p < 0.05) between activated Ras signaling, as measured by H-Ras mRNA overexpression, and increased KLF6 alternative splicing, as assayed by the ratio of KLF6Full to KLF6 SV1. In cultured cells, ectopic activation of Ras via PMA or plasmid transfection, increased the expression of KLF6 SV1 ~3 to 4 fold relative to KLF6Full, thereby enhancing cellular proliferation. Abrogation of oncogenic Ras-signaling by siRNA or a farnesyl-transferase inhibitor (FTS) decreased KLF6 SV1 ~50-80% and suppressed growth. Moreover, HCT116 and DLD1 colon cancer cell lines, which have one oncogenic K-Ras allele deleted by homologous recombination, express 40-60% less KLF6 SV1 than their parental lines containing two Ras alleles. Growth inhibition by FTS in transformed cell lines was rescued by forced expression of KLF6 SV1, indicating that SV1 partially mediates Ras’s growth promoting phenotype. Downregulation of the splice factor ASF/SF2 by siRNA increased KLF6 SV1 mRNA levels, suggesting a requirement for ASF/SF2 in KLF6Full production. Analysis of the two major signaling cascades downstream of Ras, MAP kinases and PI3-kinase using siRNAs and chemical inhibitors, implicates PI3-K/Akt in regulating enhanced KLF6 splicing. Finally, promoter-luciferase assays indicated that KLF6 alternative splicing occurs independently of its transcription. Conclusions: We have functionally linked oncogenic Ras signaling to increased splicing of KLF6 through signaling by PI3 kinase and Akt, mediated by the splice regulatory protein ASF/SF2. Our findings expand the role of both Ras and KLF6 in human HCC by identifying a novel mechanism of tumor suppressor inactivation through increased alternative splicing mediated by an oncogenic signaling cascade.

mimic human disease. To examine the significance of cytokine-Stat5 signaling in the prevention of liver fibrosis and disease, control mice and mice from which the Stat5 locus had been deleted in hepatocytes using Cre-mediated recombination were treated for 8 weeks with CCI4. While strong activation of Stat5 was observed in hepatocytes of control mice upon stimulation with growth hormone (GH), reduced activation was detected after CCI4 treatment, suggesting that cells lose their response to cytokines during early stages of fibrosis. Histological analyses revealed that Stat5 mutant mice displayed severe progression of liver fibrosis compared to control mice. Surprisingly, hepatic TGF-beta levels were greatly elevated in Stat5-ko mice after 8 weeks of treatment with CCI4. To define the molecular link between Stat5 silencing and TGF-beta upregulation, we examined mouse embryo fibroblasts from Stat5-null and control mice. In vitro experiments demonstrated that TGF-beta levels were highly elevated in the absence of Stat5 whereas TGF-beta mRNA levels remained unchanged. Protease inhibitor studies revealed that Stat5 deficiency enhances the stability of mature TGF-beta protein. These results indicate that deletion of Stat5 causes upregulation of TGF-beta protein through changing its stability.

Conclusions: This study provides evidence for a novel role of Stat5 in the development of liver fibrosis through changing the stability of TGF-beta protein. We propose that cytokine-Stat5 signaling confines the levels of TGF-beta, which in turn is protective for liver fibrosis.

153 TGF-β PATHWAY MEMBERS SMAD3 AND ELF ARE KEY REGULATORS OF HEPATOCELLULAR CANCERS

Young Woo Kim1, Peter Kreishman2, Chohee Yun1, Wilma Jogunoori1, Eugene A. Volpe1, Tapas Saha1, Jonathan S. Mendelson1, Tiffany M. Blake1, Michael J. Pishvaian1, Yi Tang1, Bibhuti Mishra1, Lopa Mishra1,2; 1Surgery, Georgetown University, Washington, MD; 2DVAMC, Washington, DC

The transforming growth factor-beta (TGF-β) pathway constitutes a central signaling network that plays an essential role in cell differentiation, proliferation, motility, apoptosis and tumorigenesis. TGF-β signals are conveyed through type I/II receptors to specific intracellular mediators known as SMAD. Activation of SMAD3, a receptor activated SMAD, results in nuclear translocation and activation of target genes. We have shown that the adaptor protein ELF plays a key role in TGF-β signaling through SMAD3 and SMAD4 (Science, 2003, 299:574-577). Further analysis has revealed that over 40% of elf+- mice spontaneously develop hepatocellular carcinoma (HCC) at the age of 12-15 months. SMAD3 has long been suspected as a major component in tumor suppression; however, studying this potential role remains elusive. Aims: 1. To investigate the importance of the ELF-SMAD3 interactions in tumor suppression. 2. To determine whether elf somatic mutations occur in human HCC. Methods: 1. We generated elf+/-/smad3+-/- double heterozygous mice. 8 heterozygous mice were dissected at the age of 10 months; tumors from various tissues were collected; RNA was isolated from each tumor tissues and was used to synthesize cDNA. The cDNA obtained was used to examine p53 mutation or to perform qPCR analysis to test the alteration of the gene expression. 2. One gastric cancer (GC) and three HCC cell lines were cultured in DMEM. cDNA was prepared and used to amplify the exons of elf to examine their mutation. Results: 1. The elf+/-/smad3+-/- mice strikingly produce high frequency of tumors in organs of mostly endodermal lineage including liver,
pancreas, stomach, small intestine, lung, thymus, and kidney. 2. Of the 28 tumor tissues, only two shows p53 point mutations replacing amino acids. Statistically, this demonstrates the existence of very low frequency of p53 mutations compared to the other reported cases of GCs and HCCs. 3. All the mice tumor tissues show dramatic decrease in elf mRNA levels (200- to 2000-fold) compared to its non-tumor tissues. In contrast, p53 mRNA levels were relatively stable in all the tissue samples. 4. SNU475, an HCC cell line shows an Arg to Ile mutation at exon 15 of elf locus. Conclusion: 1. These studies suggest that the ELF/SMAD3 interaction is a primary and powerful event in a major tumor suppressor pathway for multiple cancers that includes HCC. Loss of this interaction in whole animal system leads to multiple tumors. 2. These studies also indicate that p53 mutation is not a major secondary event during the elf-mutation-induced tumorigenesis. 3. Thus, potentially TGF-β pathway can be utilized as a predictor for HCC formation and treatment prognosis.

REGULATION OF WNT/β-CATENIN PATHWAY BY CPLA2α-MEDIATED PPARδ ACTIVATION IN HUMAN CHOLANGIOCARCINOMA CELLS

Chang Han, Kyu Lim, Lihong Xu, Quiying Li, Tong Wu; Department of Pathology, University of Pittsburgh, School of Medicine, Pittsburgh, PA

Cytosolic phospholipase A2α (cPLA2α) is a rate-limiting key enzyme that releases arachidonic acid (AA) from membrane phospholipid for the production of prostaglandins via cyclooxygenase-2. Our previous studies have shown an important role of cPLA2α in human cholangiocarcinoma growth (Hepatology 2002; 36:363-373; J. Biol. Chem. 2004, 279:44344-44354; J. Biol. Chem. 2006, 281:24831-24846; J. Biol. Chem. 2006, 281:33982-33995). Here we describe a novel role of cPLA2α for activation of peroxisome proliferator-activated receptor-δ (PPARδ) and β-catenin in human cholangiocarcinoma cells. Overexpression of cPLA2α induced the binding of PPARδ to β-catenin and increased their association with the TCF/LEF response element. These effects were inhibited by the cPLA2α siRNA and inhibitors as well as by siRNA knockdown of PPAR. Overexpression of PPARδ or treatment with the selective PPARδ ligand, GW501516, also increased β-catenin binding to TCF/LEF response element and increased its reporter activity. Addition of AA and GW501516 to nuclear extracts induced a comparable degree of β-catenin binding to TCF/LEF response element. Furthermore, cPLA2α protein is present in the PPARδ and β-catenin binding complex, suggesting that PPARδ may directly import the cPLA2α into the nucleus. Thus the close proximity between cPLA2α and PPARδ provides a unique advantage for their efficient functional coupling in the nucleus, where AA produced by cPLA2α becomes immediately available for PPARδ binding and subsequent β-catenin activation. These findings disclose a novel connection linking the cPLA2α, PPARδ and Wnt/β-catenin signaling pathways in human cholangiocarcinoma cells and suggest that these molecules may be targeted for future chemoprevention and treatment.

POTENTIATION OF PERIPHERAL INSULIN SENSITIVITY IN OB/OB MICE BY BETA-GLYCOLIPIDS IS MEDIATED BY IRS-1 MTOR SIGNALING PATHWAYS: A NOVEL THERAPEUTIC TARGET FOR NASH

Madi El-Haj1, Gadi Lalazar1, Ami Ben Ya’acov1, Mali Katzeniel-Gilad2, Gil Leibowitz3, Yaron Ilan1; 1Liver Unit, Hadassah Hebrew University Medical Center, Jerusalem, Israel; 2Endocrinology and Metabolism, Hadassah Hebrew University Medical Center, Jerusalem, Israel

The serine threonine kinase mTOR is regulated by nutrients and growth factors. Activation of mTOR and its downstream target S6K1 results in down regulation of insulin signaling. It was previously shown that naturally occurring beta-glycolipids alleviate the metabolic derangement of NASH. Aim: To study whether the beneficial effect of beta-glycolipids is mediated via the mTOR/S6K1 pathway. Methods: Four groups of ob/ob mice were treated by oral administration of beta-glycosylceramide (GC), beta-lactosylceramide (LC), GC and LC together or with PBS alone. The effect of the different glycolipids on the metabolic state of the treated animals was assessed by an i.p. glucose tolerance test (GTT) and measurement of fasting serum insulin, lipids, liver enzymes and TNF-alpha after treatment for 45 days. Liver steatosis was determined by Oil-red-O staining. The effects of glycolipids on insulin signaling were studied by immunoblot analysis of IRS-1, mTOR, AKT/PkB and S6K phosphorylation in liver extracts of treated animals. Results: Treatment with beta-glycolipids decreased mTOR and S6K phosphorylation. This was associated with markedly increased total IRS1 and a decreased IRS1 serine 636/639 phosphorylation, corrected for total IRS1. Moreover, AKT/PkB phosphorylation was significantly increased indicating that liver insulin action was enhanced. These effects were associated with a marked improvement of glucose tolerance in animals treated with GC and the combination of GC and LC, but not with LC alone. The beneficial effect was manifested by decreased serum insulin levels (81.33 and 56.4 vs. 131.59 and 103.21 microgram/L for GC and the combination, compared to the LC group and PBS, respectively). Alleviation of liver injury was noted by decreased liver enzymes and by markedly reduced TNF-alpha serum levels (62 and 105 vs. 181 and 155 pg/ml in GC and the combination compared with LC and PBS groups, respectively); reduced hepatic steatosis as evidenced by Oil-red-O staining showed an improvement in the lipid profile noted by increased HDL cholesterol (3.76 of 4.5 mmol/l total cholesterol vs. 3.6 of 5 mmol/l total cholesterol, in GC vs. PBS, respectively). Conclusion: beta-glycolipid treatment inhibited the mTOR/S6K1 pathway, thereby improving insulin sensitivity. These effects were associated with significant amelioration of the metabolic abnormalities in NASH and reduced serum TNF-alpha levels. Inhibition of the mTOR pathway may serve as a novel therapeutic target for this disease.

IMPACT OF HEPATOCYTE SPECIFIC LOSS OF C-MET SIGNALING ON LIVER REGENERATION

Valentina M. Factor, Pal Kaposi-Novak, Elizabeth A. Conner, Snorri S. Thorgersson; Laboratory of Experimental Carcinogenesis, National Cancer Institute, Bethesda, MD

c-Met is a receptor tyrosine kinase for hepatocyte growth factor (HGF). Previous work has established that HGF plays a pivotal role...
role in regulating the onset of S phase and DNA replication following partial hepatectomy. We used c-Met conditional knockout mice in which c-met gene is inactivated in postnatal hepatocytes by Alb-Cre recombinase (MetLivKO) to directly evaluate the biological outcome of a selective loss of c-Met in hepatocytes on liver regeneration. The priming events appear to be intact in MetLivKO livers. Up-regulation of stress response (e.g. MAFK, IKBZ, SOCS3) and early growth response (e.g. MYC, DUSP1 and 6) genes as judged by microarray profiling was similar in MetLivKO and Alb-Cre control regenerating livers. This was consistent with an early induction of NF-kB, STAT3, and MAPK/ERK. Nevertheless, in the absence of c-Met signaling in the hepatocytes, ERK phosphorylation rapidly declined although it remained high in Alb-Cre control livers. Also, MetLivKO mice displayed impaired liver regeneration as determined by a decrease in BrdU incorporation and a delay in timely progression into mitosis. Upstream signaling pathways involved in the block of G2/M transition included lack of EGR1 transcription factor induction, and inability to increase cdc2, aurora B and Mad2 expression followed by decreased histone 3 phosphorylation and lag in chromatin condensation. However, after a delayed passage through G2 phase, c-Met deficient cells eventually entered mitosis. In culture, EGF treatment increased proliferation of MetLivKO hepatocytes and restored expression levels of cell cycle regulators aurora B and Mad2 albeit to a lesser degree than in similarly treated Alb-Cre control hepatocytes. In conclusion, our results assign a novel function for HGF/c-Met signaling in the regulation of G2/M transition during liver regeneration and implicate EGR1 as a potential G2/M target of HGF/c-Met pathway.

157 DIFFERENTIAL EFFECTS OF JNK1 AND JNK2 ON THE DEVELOPMENT OF STEATOHEPATITIS
Rajat Singh1, Yongjun Wang1, Youqing Xiang1, Kathryn Tanaka1, William A. Gaarde2, Mark J. Czaja3; 1Albert Einstein College of Medicine, Bronx, NY; 2Isis Pharmaceuticals, Inc, Carlsbad, CA

Prior studies in the murine methionine- and choline-deficient diet-induced model of steatohepatitis demonstrated that a genetic knockout of the c-Jun N-terminal kinase (JNK) isoform JNK1, but not JNK2, decreased the development of steatosis and liver injury. However, the function of JNK1/2 in an obese/insulin resistant model of steatohepatitis, and the ability of JNK inhibition to reverse established NAFLD, were not determined. The aim of this study was to examine the effect of inhibition of JNK1/2 function on the development and treatment of high fat diet (HFD)-induced steatohepatitis. Wild-type C57BL/6 (WT), jnk1−/− and jnk2−/− mice were fed a regular diet (RD) or HFD. After 16 weeks of HFD, jnk1−/− mice had significantly decreased body weights, liver weights, serum glucose and insulin levels, and HOMA as compared to WT and jnk2−/− mice. Hepatic triglyceride (TG) content was equivalent in both RD-fed WT mice and HFD-fed jnk1−/− mice (11.1 vs. 10.0 ug/mg), but increased 10-fold with HFD in WT and jnk2−/− mice (110.2 and 108.3). The histological grade of steatosis was also significantly decreased in HFD-fed jnk1−/− mice from that in WT mice (0.4 vs. 2.4). Liver injury was significantly reduced in HFD-fed jnk1−/− mice as compared to WT mice by measures of ALT (57 vs. 153 IU/ml), numbers of TUNEL positive cells (1.0 vs. 4.4 per HPF), and inflammation score (0.5 vs. 1.1). To determine whether JNK1 inhibition could reverse established steatohepatitis, WT mice were injected with control, JNK1 or JNK2 antisense oligonucleotides (ASO) after 12 weeks of HFD, a point at which stable steatohepatitis was established. JNK1 ASO partially reversed the steatohepatitis as indicated by decreases in hepatic TG (26.9 vs. 48.0), ALT (44 vs. 76) and TUNEL positivity (1.8 vs. 3.9) as compared to control ASO injected mice. JNK2 ASO injected mice had increased TG content (61.8), ALT (6,334), and TUNEL positivity (11.8) with histological evidence of lobular disarray, inflammation and apoptosis. Immunoblots revealed increased levels of proapoptotic Bim in JNK2 ASO-injected mice on HFD. Bim mediated the increase in hepatitis as HFD-fed, JNK2 ASO-injected bim−/− mice had significantly less liver injury. In conclusion, JNK1 mediates the development of HFD-induced steatohepatitis and JNK1 inhibition decreases both established steatosis and hepatitis. In contrast, JNK2 is not involved in the development of this disease and JNK2 inhibition markedly worsens existing disease through Bim up regulation. Targeting the metabolic syndrome or NAFLD with anti-JNK therapy may therefore require selective inhibition of JNK1 and not JNK2 function.

158 A PIVOTAL ROLE FOR CD154 IN LIVER STEATOSIS
J. Villeneuve1, S. Lepreux1, P. Coste2, C. Combe1, A. Desmouliere3, P. Bioulac-Sage1, C. Balabaud1, V. de Ledinghen1, A. T. Nurdan4, J. Rosenbaum1, J. Ripoche1; 1InsERM U 889 and IFR 66, Bordeaux, France; 2Universite Victor Segalen Bordeaux 2, Bordeaux, France; 3EA 3842, Universite de Limoges, Limoges, France; 4Centre de Reference des Pathologies Plaquettaires, Centre Hospitalier et Universitaire and IFR 4, Bordeaux, France

Aim: Liver steatosis is a first pathogenic step in non-alcoholic fatty liver disease and is regulated by inflammatory signals. IL-6 is thought to play an essential role in fat processing in the liver. CD154 is a major inducer of inflammatory mediators, among which is IL-6, through triggering of its receptor, CD40. Our purpose was to investigate the contribution of CD154 in liver steatosis. Animal model: We developed a mouse model of steatosis by olive oil force-feeding. Male Balb/c CD154 KO mice were generated from male B6/C CD154 KO mice (Jackson laboratory). Results: [1] Major liver steatosis occurs in CD154 KO animals. Fat diet led to obvious steatosis in CD154 KO mice, in contrast to the results with wild type (WT) mice (n = 10 and 5 groups of mice analyzed at 3 and 10 weeks, respectively). The difference was consistent in each group studied and readily apparent on macroscopic examination of livers. CD154 KO livers showed an important centrilobular macrovesicular steatosis on Haematoxylin-Eosin stained tissue sections, lipid accumulation being confirmed by oil-red staining. There were no foci of lobular inflammation in either setting. The difference in fat processing between WT and KO animals was further shown by comparing perigonadal fat pad storage (decreased fat pad weight by an average of 3.5 fold in KO mice, n = 6), showing that CD154 KO mice failed to export lipids from their liver. [2] The expression of Interleukin-6 (IL-6) mRNA is reduced in CD154 KO mice livers. As IL-6 controls fat processing in the liver and is induced by CD154 in cells expressing CD40, we investigated IL-6 mRNA expression by quantitative PCR in livers of both groups. There was a profound reduction of IL-6 mRNA expression in CD154 KO livers (average of 6-fold [n = 10]). [3] Hepatic Stellate Cell (HSCs) activation is absent in CD154 KO mice. HSC activation was assessed by the neo-expression of α-smooth muscle actin. In WT animals, HSCs were diffusely activated; in contrast, there was a lack of
HSC activation in CD154 KO animals. Conclusions: CD154 is therefore pivotal in liver steatosis. We propose that CD154 represents a link between lipid metabolism and the inflammatory response in the liver and that IL-6 is in the pathway. Absence of CD154 is accompanied by a lack of HSC activation. We hypothesize a model in which CD154 is essential to the activation of CD40-expressing cells, notably HSCs, Kupffer and endothelial cells and subsequent increased production of IL-6. Upon activation of these cells, an IL-6-dependent loop helps processing of lipids by the hepatocytes. Absence of CD154 leads to a lower IL-6 production and defective handling of the triglycerides by the liver.

The following people have nothing to disclose: J. Villeneuve, S. Lepreux, P. Costet, C. Combe, A. Desmoulere, P. Bouilac-Sage, C. Bababaud, V. de Ledinghen, A. T. Nurden, J. Rosenbaum, J. Ripoche

159 TRANSCRIPTION FACTOR NRF2 REGULATES HEPATIC LIPID METABOLISM THROUGH ORPHAN NUCLEAR RECEPTOR SHP
Jiansheng Huang1, Ningyi Xu1, Noriko Estery2, Robert Nedved1, Xilin Chen3, Curtis Klaassen4, Grace Guo2, Li Wang1; 1Medicine & Pharmacology, University of Kansas Medical Center, Kansas, KS; 2Pharmacology, University of Kansas Medical Center, Kansas, KS; 3AtheroGenics, Inc., Alpharetta, GA

Background: Nuclear factor erythroid-2 related factor 2 (Nrf2) plays a pivotal role in cytoprotection against endogenous oxidative stress and exogenous xenobiotics in the liver. However, its role in lipid homeostasis has not been explored before. The aim of this study is to elucidate the potential function of Nrf2 in hepatic lipid metabolism. Methods: Nrf2 knockout mice were used as in vivo mouse models. Assays include: LC- GC (liquid and gas chromatography) analysis of serum and hepatic lipid metabolites, real-time PCR, hepatic oil red O and H&E staining, GTT and ITT, in vitro islet perfusion, lipase activities, VLDL production, TG clearance, transient transfection, gel-shift, mutagenesis, ChIP assay, adenosine transduction, RNAi interference, hepatocyte culture, Northern and Western blots. Results: Changes in serum and hepatic lipid content was not evident in 2 month old Nrf2KO mice. However, LC-GC analysis revealed markedly decreased hepatic triacylglycerol, but increased level in cholesterol ester in 6 month old Nrf2KO. In contrast, no changes of free fatty acids, lysophosphatidylcholine, phosphatidylcholine and phosphatidylethanolamine were observed between wild-type and Nrf2KO. Neutral lipid staining using oil-red O appeared to be smaller and lighter in Nrf2KO hepatocytes as compared to wild-type mice. Interestingly, the Nrf2KO exhibited significantly increased glucose tolerance and insulin sensitivity as examined by GTT and ITT, which was strongly associated with increased expression of genes in glucose metabolism and insulin sensing in the liver. Both RT-PCR and real-time PCR analysis revealed that genes in lipid synthesis were generally downregulated, whereas genes in lipid oxidation were generally upregulated. Surprisingly, challenging mice with high fat diet diminished the differences in liver lipid phenotype observed in control diet fed wild-type and Nrf2KO mice. Among nuclear receptor genes that were examined, the small heterodimer partner SHP expression was markedly decreased in Nrf2KO liver. By using transient transfection, mutagenesis, ChIP assay and gel-shift assay, we demonstrated that Nrf2 was a potent transcriptional activator of SHP gene expression. Thus the decreased hepatic lipid observed in Nrf2KO may be due to a secondary effect of decreased SHP function. Conclusions: We conclude that Nrf2 may play an important role in regulating hepatic lipid homeostasis through indirect targeting of nuclear receptor SHP and other lipid metabolic regulators. 160 PROBIOTICS IMPROVE HIGH-FAT DIET INDUCED STEATOSIS AND INSULIN RESISTANCE THROUGH MODULATION OF HEPATIC NKT CELLS
Xiong Ma1,2, Jing Hua1,2, Zhiping Li1; 1Division of Gastroenterology, Johns Hopkins University, Baltimore, MD; 2Gastroenterology, Renji Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Background: Obesity and its associated conditions, such as fatty liver disease and insulin-resistance, have increased rapidly. Among various factors that contribute to obesity-related diseases, dietary macronutrients and intestinal bacteria play an important role. High fat diets induce both obesity and insulin-resistance in experimental animals and humans. Germ free mice colonized with gut bacteria from obese mice gain a greater amount of weight than mice colonized with gut bacteria from lean mice. Probiotics, live microbial food supplements, help maintain the balance of intestinal micro-flora. Our previous study showed that probiotic therapy improved steatohepatitis and insulin resistance in leptin deficient, ob/ob mice. In the current study, we evaluated the effect of probiotics on high fat diet induced obesity, fatty liver and insulin resistance. Methods: Wild type C57BL6 mice were fed high fat diet to induce obesity, insulin resistance and hepatic steatosis. Some high fat diet fed mice also received probiotics (VSL#3) via oral lavage. Liver histology, glucose tolerance test and hepatic NKT cell content were evaluated at different time points. In addition, hepatic cytokines, IKKbeta activity and insulin signaling were also evaluated. Results: High fat diet induced a hepatic NKT cell depletion that preceded the formation of insulin resistance and hepatic steatosis. Adoptive transfer of NKT cells also improved insulin resistance and steatosis. The effects of probiotics on high fat induced insulin resistance and steatosis were diminished in CD1d knock out mice that lack NKT cells. In addition, high fat diet also increased the expression of the proinflammatory cytokine, tumor necrosis factor-alpha, that activated IKKbeta and reduced the sensitivity of insulin signaling, which were all reversed by either probiotic treatment or adoptive transfer NKT cells. Conclusions: Probiotics improve high fat diet induced steatosis and insulin resistance. These effects of probiotic are likely due to modulation of hepatic NKT cells to inhibit inflammatory signaling. These observations support the concept that dietary factors and intestinal bacteria promote hepatic insulin resistance and NAFLD. Results from our current study may have profound therapeutic implications for the management of obesity-related fatty liver and insulin-resistance.

RATS SELECTIVELY BRED FOR LOW AEROBIC CAPACITY DEVELOP NONALCOHOLIC FATTY LIVER DISEASE

John Thyfault1,2, R. Scott Rector4, Grace Upptergrove5, E. M. Morris5, Yongzhong Wei5, Matthew Laye6, Suzanne Clark2, L. G. Koch1, S. L. Britton7, Jamal A. Ibdah8,1, 1Nutritional Science and Internal Medicine, University of Missouri, Columbia, MO; 2Research, Harry S. Truman Memorial VA Hospital, Columbia, MO; 3Physical Medical and Rehabilitation, University of Michigan, Ann Arbor, MO; 4Molecular and Integrative Physiology, University of Michigan, Ann Arbor, MO; 5Internal Medicine, University of Missouri, Columbia, MO; 6Medical Pharmacology and Physiology, University of Missouri, Columbia, MO

Non-alcoholic fatty liver disease (NAFLD) has been linked to a sedentary lifestyle and low aerobic fitness. There is a paucity of knowledge detailing the link between low aerobic fitness and susceptibility for NAFLD. We previously reported a novel model in which rats were artificially selected over several generations for high and low exercise endurance capacity (Science, 307:418-20, 2005). The selected breeding resulted in high capacity runners (HCR) and low capacity runners (LCR) with robustly different aerobic fitness levels. Because these rats intrinsically display contrasting phenotypes, we chose this model to assess the role of aerobic fitness in the development of NAFLD. Sedentary (only cage activity) normal chow-fed LCR and HCR rats were sacrificed at ~25 weeks of age (generation 17; max running distance equaled 1,514±91 vs. 200±12 meters for HCR and LCR, respectively). LCR rats displayed metabolic syndrome characteristics including elevated plasma insulin and triglycerides, heavier body weights, and larger adipocyte pad weights and cell volumes compared to the HCR rats. LCR rats also had higher liver triglycerides (6.00±0.71 vs. 4.20±0.39 nmol/g, p =0.020 value), a higher steatosis score (P=0.004), and >2-fold higher percentage of hepatocytes associated with lipid droplets (54.0±9.2 vs. 22.0±3.5%, p=0.006) than the HCR rats, demonstrating evidence of early steatosis in the LCR rats. The LCR livers also displayed a lipogenic phenotype with higher protein content of both sterol regulatory element binding protein-1c and acetyl CoA carboxylase. In addition, the LCR livers displayed reduced mitochondrial oxidative capacity as shown by lower β-hydroxyacyl-CoA dehydrogenase and citrate synthase enzyme activities. Further, analysis of hepatic 4-hydroxynonenal levels revealed a significant increase in hepatic lipid peroxidation in the LCR compared to the HCR rats (P=0.04). In conclusion, normal chow-fed LCR rats display early development of NAFLD, while HCR rats show no abnormalities. These data support a link between low aerobic fitness and NAFLD and demonstrate the usefulness of this novel model to study underlying molecular mechanisms.

CB2 RECEPTOR ANTAGONISM REDUCES DIET-INDUCED OBESITY, INSULIN RESISTANCE AND HEPATIC STEATOSIS

Vanessa Deveaux1, Yasukatsu Ichigotani1, Fatima Teixeira-Clerc1, Jeanne Tran-Van-Nhieu1,2, Thomas Decaens1,2, Melïha Karzak4, Andreas Zimmer4, Ariane Mallat1,2, Sophie Latersztajn1,2, 1INSERM, U841, Creteil, France; 2AP-HP, Groupe hospitalier Henri Mondor- Albert Chenevier, Service d’Hépatologie et de, Creteil, France; 3AP-HP, Groupe hospitalier Henri Mondor- Albert Chenevier, Dept de Pathologie, Creteil, France; 4University of Bonn, Department of Psychiatry, University of Bonn, Bonn, Germany

Recent data have established the crucial role of inflammation in obesity, insulin resistance and metabolic steatosis. Growing evidences indicate that the endocannabinoid system plays a major role in obesity and steatosis via CB1 receptors. However, the possible contribution of the cannabinoid receptor CB2 has not been reported. Interestingly, CB2 receptors are predominantly expressed in inflammatory cells and regulate immune and inflammatory responses. Therefore, in the present study, we investigated the role of CB2 receptors in insulin resistance and hepatic steatosis, owing to the use of CB2KO and wild type mice subjected to a high fat diet for 15 weeks. After 15 weeks of high fat diet, WT mice exhibited marked induction of CB2 receptor expression in white epididymal adipose tissue, and unchanged levels in the liver. Strikingly, body weight was significantly lower in CB2 KO mice [41.6 ±1.3g for CB2/- vs 46.7±1.2g for WT, p<0.05], despite similar food intake. As expected, WT mice developed insulin resistance as assessed by elevated serum insulin levels, increased HOMA-IR and reduced insulin tolerance tests. In contrast, these parameters were significantly improved in CB2 KO animals, indicating reduced insulin resistance. Finally, whereas WT mice developed severe fatty liver, as shown by histological analysis of liver tissue sections and increased hepatic triglycerides, hepatic CB2 KO mice exhibited minimal hepatic steatosis. We also investigated the consequences of CB2 antagonism on inflammation. As expected, obese WT mice displayed increased inflammation in the white epididymal adipose tissue and in the liver, as indicated by a strong increase in the density of macrophages and a parallel induction of TNF-a and MCP-1 mRNA expressions. In contrast, high fat diet-fed CB2/- mice showed significantly lower inductions of F4/80, TNF-a and MCP-1 mRNAs in white adipose tissue and in the liver. In conclusion, our results unravel a novel role for CB2 in the pathogenesis of obesity, insulin resistance and hepatic steatosis induced by a high fat diet, by a mechanism that probably involves a proinflammatory effect of CB2 receptors in the adipose tissue. These data identify CB2 as a potential novel therapeutic target for the treatment of liver injury associated to the metabolic syndrome.

163 EXCELLENT LONG-TERM OUTCOME FOLLOWING DOWNSTAGING OF HEPATOCELLULAR CARCINOMA PRIOR TO LIVER TRANSPLANTATION: AN INTENTION-TO-TREAT ANALYSIS

Francis Y. Yao1,2, Robert Kerlan1, Timothy J. Davern1, Ryo Hirose3, Nathan M. Bass1, Sandy Feng2, Marion G. Peters2, Norah Terrault1, Chris Freise1, Nancy L. Ascher2, John P. Roberts2; 1Medicine, University of California, San Francisco, San Francisco, CA; 2Surgery, University of California, San Francisco, San Francisco, CA; 3Radiology, University of California, San Francisco, San Francisco, CA

BACKGROUND: We previously reported encouraging results of down-staging of hepatocellular carcinoma (HCC) to meet conventional criteria for orthotopic liver transplantation (OLT) (Liver Transpl 2005; 11:1505). In this ongoing prospective study, we present longer follow-up data in a larger cohort.

METHODS: Between June 2002 and January 2007, 61 patients with tumor stage exceeding conventional T2 criteria were enrolled in a down-staging protocol. The eligibility criteria for down-staging included 1 lesion > 5 cm but within 8 cm, 2 or 3 lesions at least one > 3 cm but all within 5 cm with total tumor diameter up to 8 cm, or 4 to 5 nodules none greater than 3 cm, with total tumor diameter within 8 cm. Imaging criteria for successful down-staging included a decrease in tumor size to within T2 criteria, or complete tumor necrosis with no contrast enhancement. Patients were eligible for living-donor liver transplantation (LDLT) if the tumors were down-staged to within the proposed UCSF criteria (1 lesion up to 6.5 cm, or 2 to 3 lesions none greater than 4.5 cm with total tumor diameter within 8 cm). A minimum follow-up period of 3 months after down-staging was required before OLT.

RESULTS: Down-staging treatments included trans-arterial chemoembolization (TACE) alone in 15, laparoscopic or open radiofrequency ablation (RFA) alone in 11 patients, TACE combined with percutaneous ablation in 15, laparoscopic RFA plus TACE in 14, and resection in 6 patients. By intention-to-treat analysis, tumor down-staging was successful in 43 patients (70.5%). Thirty-five patients (57.4%) had received OLT, including 2 who had LDLT. Six patients were still awaiting OLT. Follow-up was censored in 2 other patients who had successful down-staging but were excluded for OLT for other reasons. Treatment failure was observed in 18 patients (29.5%), including 3 deaths without OLT, and 15 dropouts due to tumor progression. In the explant of 35 patients who underwent OLT, 13 had complete tumor necrosis, 17 met T2 criteria, and 5 exceeded T2 criteria. The Kaplan-Meier intention-to-treat survival at 1 and 4 years after down-staging was 87.5% and 69.3%, respectively. The 1- and 4-year post-transplant survival rates were 96.2% and 92.1%, respectively. None had HCC recurrence after a median follow-up of 25 months after OLT (range 1.7-57 months). In univariate analysis, the only factor predicting treatment failure was pre-transplant alpha-fetoprotein > 1000 ng/mL (HR 7.8, p<0.001).

CONCLUSION: In carefully selected patients, down-staging of HCC to meet conventional criteria for OLT can be achieved in the majority of patients, and is associated with excellent post-transplant outcome.

A PROSPECTIVE MULTICENTRIC FOLLOW-UP STUDY ON 105 PATIENTS WITH ACUTE PORTAL VEIN THROMBOSIS (PVT): RESULTS FROM THE EUROPEAN NETWORK FOR VASCULAR DISORDERS OF THE LIVER (EN-VIE)

Aurelie Plessier, Sarwa Darwish Murad, Manuel Hernandez-Guerra, Yann Consigny, Federica Fabris, Jorg Heller, Isabelle Morard, Philippe Langlet, Mathias Bahr, Eapen Eapen, Helena Miranda, Marie-hélène Deninger, Dominique Vidaud, Bertrand Condalt, Antoine Hadengue, Elwyn Elias, Massimo Primignani, Juan Carlos Garcia-Pagan, Harry L. Janssen, Dominique Valla, Hepatology, AP-HP INSERM-U773 & University Paris-7, Hôpital beaumont, Clichy, France; Department of Gastroenterology and Hepatology, Erasmus University Medical Center Rotterdam, Rotterdam, Netherlands; Hepatic Hemodynamic Laboratory, Liver Unit, Hospital Clinic, Barcelona, Spain; Department of Hepatogastroenterology, IRCCS Maggiore Hospital and University of Milano, Milan, Italy; Liver Unit, Medizinische Klinik I Universitätsklinik Bonn, Bonn, Germany; Division of Gastroenterology and Hepatology, Geneva University Hospitals, Geneva, Switzerland; Department of Hepatogastroenterology, Centre Hospitalier Universitaire Brugmann, Bruxelles, Belgium; Department of Gastroenterology, Hepatology, and Endocrinology, Hannover Medical School, Hannover, Germany; Liver Unit, Queen Elisabeth Hospital Birmingham, Birmingham, United Kingdom; Liver Transplantation Unit, Hospital General Santo Antonio, Porto, Portugal; Hematology, genetics and biochemical unit, Hôpital beaumont, Clichy, France

Extra hepatic portal hypertension (PHT) and intestinal infarction are potentially lethal complications of acute PVT. Current recommendation for early anticoagulation is based on extremely limited, retrospective data. Aims: to assess prospectively the extent of, and predictive factors for recanalization of acute non-cirrhotic, non-malignant PVT. Between 2003 and 2006, patients were prospectively enrolled in 9 European countries, if there was radiographic evidence for a recent thrombus in the portal vein trunk or one of its main branches, and absence of cavernoma. Expert radiological review and centralised etiological work-up were obtained. Patients were followed from date of diagnosis until death or last visit. End points were (i) relief of extrahepatic PHT (i.e. patency of portal vein trunk and one of its main branches); and (ii) bleeding, intestinal infarction, or death. Results: 105 eligible patients (53 males, median age 49 years) were followed-up a median of 229 days (range 0-904 days). At diagnosis, extrahepatic PHT was present in 91 (87%) patients, and complete obstruction including mesenteric and splenic veins in 29 (28%). A local factor was found in 25% of patients; prothrombin gene mutation in 19%; V617F-JAK2 mutation in 14%; a myeloproliferative disease in 8% of JAK2-wild type patients; factor V Leiden in 14%; protein S deficiency 9%; C677T homozygous MTHFR mutation in 4%, and oral contraceptive use in 22%. Early anticoagulation was given to 97 patients, with a median delay of 0 days (range -7 to 52), and TIPS inserted in 1 patient. At 1-year follow-up, relief of extrahepatic PHT was obtained in 44% of treated patients. Independent predictive factors for the absence of relief of extrhepatic PHT was ascites (assessed with radiological procedure) (HR= 3.0, 95% CI: 1.2-8.1). The one year recanalization rate was of 38% in patients with ascites vs 65% without (p=0.02).Type and number of prothrombotic disorders failed to predict outcome. On anticoagulation, non-lethal bleeding occurred in 9 patients (gastrointestinal 5, nasal 2, procedure-related 2), and intestinal infarction in none. Two patients died, 1 from sepsis and 1 from late malignancy. Conclusion In this cohort, anticoagulation for acute PVT relieved PHT in 44% of patients at one year, and no intestinal infarction was seen in all, independently from causes. Non-lethal bleeding occurred in 9%, and mortality was 2%. These data support a recommendation for early anticoagulation. Nevertheless, at one year 62% of our patients with ascites had persisting extrahepatic PHT despite anticoagulation, and may therefore be candidates to test alternatives procedures.

THE PLASMA LIPIDOMIC SIGNATURE OF NONALCOHOLIC STEATOHEPATITIS: DIFFERENTIAL LEVELS OF N-3 AND N-6 POLYUNSATURATED FATTY ACIDS AND THEIR LIPOXGENASE PRODUCTS

Puneet Puri, Michelle M. Wiest, Meeta Patnaik, Onpan Cheung, Carol C. Sargeant, Faridoddin Mirshahi, Steven M. Watkins, Arun J. Sanyal, Division of Gastroenterology, Hepatology and Nutrition, Virginia Commonwealth University, Richmond, VA; Lipomics Technologies, Inc., West Sacramento, CA

BACKGROUND: Nonalcoholic steatohepatitis (NASH) is characterized by increased hepatic triacylglycerol, free cholesterol (FC):phosphatidylcholine (PC) and n-6-n-3 polysaturated fatty acid (PUFA) ratio (Puri et al, Hepatol, 2007 in press). The plasma lipidomic signature and its diagnostic utility in NASH are unknown. AIMS: To define (1) the plasma lipidomic profile in subjects with NASH and compare it to nonalcoholic fatty liver (NAFL) and lean normal controls, (2) the basis for changes in plasma PUFA, and (3) the diagnostic utility of these changes for NASH. METHODS: NAFL and NASH were identified by liver biopsy and clinical assessment. Plasma lipid classes and their fatty acid composition were measured by GC-FID and inflammatory lipids including products of cyclooxygenase (COX), lipoxgenase (LOX) and cytochrome p-450 (Cyp) activities were measured by LC-MS. RESULTS: A total of 52 subjects were studied (normal:NAFL:NASH 12:10:30). Lipidomic profile: NASH was associated with significantly decreased PC (2165:1838:1787 nmole/g, p< 0.001) and higher FC:PC ratio (0.6:0.6:0.7, p< 0.02) relative to normal. Total n-3 PUFA (nmole/g) were specifically depleted in NASH (428:491:340, p< 0.02 NASH vs normal and NAFL) resulting in increased n-6:n-3 ratio in NASH (10.7:9.5:12.8, p< 0.04). PUFA metabolism: The linoleic acid (LA):α-linolenic acid (ALA) ratio in free fatty acid was significantly increased in NASH (11.7:13:14.9, p<0.0005 NASH vs normal). Although ALA was decreased, mead acid was not increased indicating an absence of dietary deficiency. N-6 changes: Arachidonic acid (AA):dihomogamalaminolenic acid (DGLA) was decreased in NASH suggesting decreased Δ5-desaturase activity or increased utilization. Pro-inflammatory LOX products of AA (hydroxyeicosatetraenoic acids [HETE]; 8HETE, 9HETE, 11HETE, 15HETE) were increased (p< 0.05 for all) in NASH; COX products were
unchanged and 8.9 diHETE, a Cyp product of AA was increased. N-3 changes: ALA levels were decreased in NASH while eicosapentaenoic acid was unchanged. Docosahexanoic acid (DHA), a downstream n-3 PUFA, was decreased significantly in all lipid classes in NASH. 19,20 diHDPA, a Cyp product of DHA, was also decreased in NASH. Diagnostic utility: An n-6:n-3 ratio ≥ 12.5 separated NASH from other groups (AUROC 0.77, + likelihood ratio 11.4, p< 0.0001). CONCLUSIONS: NASH is associated with increased FC:PC and n-6:n-3 PUFA in plasma. N-3 changes: ALA levels were decreased in NASH. Diagnostic utility: An n-6:n-3 ratio may be useful as a diagnostic tool for NASH.

167 ROBUST SYNERGISTIC ANTIVIRAL EFFECT OF R1626 IN COMBINATION WITH PEGIFN-ALFA-2A (40KD), WITH OR WITHOUT RIBAVIRIN – INTERIM ANALYSIS RESULTS OF PHASE 2A STUDY

Paul J. Pockros1, David Nelson2, Eliot Godofsky3, Maribel Rodriguez-Torres4, Greg Everson5, Michael W. Fried6, Reem H. Ghalib7, Stephen A. Harrison8, Lisa M. Nyberg9, Mitchell L. Shiffman10, George Z. Hill11, Anna Chan12,13, Scripps Clinic, La Jolla, CA; 2University of Florida, Gainesville, FL; 3University Hepatitis Center, Bradenton, FL; 4Fundacion de Investigacion de Diego, San-turce, PR; 5University of Colorado Health Sciences Center, Denver, CO; 6University of North Carolina at Chapel Hill, Chapel Hill, NC; 7The Liver Institute at Dallas Methodist Hospital, Dallas, TX; 8Brooke Army Medical Center, Houston, TX; 9Kaiser Permanente Medical Center, San Diego, CA; 10McGuire VA Medical Center, Richmond, VA; 11Roche Palo Alto, CA; 12Roche, Nutley, NJ

The novel nucleoside, R1626, is a potent inhibitor of the HCV RNA polymerase. When administered as monotherapy to patients with chronic hepatitis C, R1626 demonstrates dose-dependent decreases in HCV RNA blood levels. This Phase 2a study evaluated the safety and efficacy of R1626 administered for 4 weeks in combination with 180 µg peginterferon alfa-2a (PEG-IFNα-2a) ± 1000–1200 mg ribavirin (RBV) in HCV genotype 1 treatment-naïve patients. 104 patients were randomized to: Dual Low: 1500 mg bid + PEG-IFNα-2a (n=21); Dual High: 3000 mg bid + PEG-IFNα-2a (n=32); Triple Low: 1500 mg bid + PEG-IFNα-2a + RBV (n=31); SOC: PEG-IFNα-2a + RBV (n=20). Virological response was measured by Roche COBAS TaqMan (undetectable <15 IU/mL). At 4 weeks HCV RNA was undetectable in 81% of patients treated with Triple Low (mean reduction of 5.2 log10 IU/mL), 69% treated with Dual High (mean reduction of 4.5 log10 IU/mL), and 33% treated with Dual Low (mean reduction of 3.6 log10 IU/mL), compared to only 5% of patients treated with SOC (mean reduction of 2.4 log10 IU/mL). Synergy was observed between R1626 and SOC (additional 2.8 log10 IU/mL, Triple Low vs. SOC), and between R1626 and RBV (additional 1.6 log10 IU/mL, Triple Low vs. Dual Low) (Figure). ALT normalized in approximately 50% of patients in R1626 treatment groups. Most adverse events (AEs) were mild or moderate. Six patients had 8 serious AEs during the 4-week period: 4 in Dual High, 1 in Triple Low and 1 in SOC. The incidence of Grade 4 neutropenia was 48%, 78%, 39% and 10% in Dual Low, Dual High, Triple Low and SOC, respectively and was the main reason for dose reductions. In conclusion, a robust synergistic antiviral effect was observed when R1626 is combined with PEG-IFNα-2a ± RBV, with up to 81% of patients undetectable by week 4. Dosing of R1626 may be limited mainly by neutropenia; additional studies of different dosages of R1626 in combination with PEG-IFNα-2a and RBV are underway.

168 THE DIRECT TRIAL (DAILY-DOSE CONSENSUS INTERFERON AND RIBAVIRIN: EFFICACY OF COMBINED THERAPY): TREATMENT OF NON-RESPONDERS TO PREVIOUS PEGYLATED INTERFERON PLUS RIBAVIRIN: SUSTAINED Virologic RESPONSE DATA

Bruce Bacon1, Arie Regev2, Reem H. Ghalib3, Giuseppe Morelli4, Kenneth D. Rothstein5, Mitchell L. Shiffman6, Tarek Hassanein7, Janet Hammond8, Saint Louis University Liver Center, Saint Louis University School of Medicine, St. Louis, MO; 2University of Miami, Miami, FL; 3Liver Institute at Methodist Hospital, Dallas, TX; 4University of Florida, Gainesville, FL; 5Albert Einstein Center for Liver Disease, Philadelphia, PA; 6Virginia Commonwealth University, Richmond, VA; 7University of California San Diego, San Diego, CA; 8Valeant Pharmaceuticals North America, Aliso Viejo, CA

Background: Approximately 50% of HCV treatment-naïve patients treated with pegIFN/RBV fail therapy. A controlled trial of re-treatment of pegIFN/RBV non-responders with a subsequent course of pegIFN/RBV resulted in only a 3% sustained response. Daily use of consensus interferon (CIFN), which in vitro has been shown to be more effective than IFN alfa-2a and IFN alfa-2b, allows constant pharmacologic pressure on HCV and, when combined with RBV, may be an effective treatment option for previous pegIFN/RBV non-responders. Methods: The DIRECT clinical trial was a Phase 3, open-label, multi-center US-based study that enrolled 343 patients who were previous non-responders to pegIFN/RBV therapy. Patients were randomized to receive 48 weeks of CIFN 9 µg/day or CIFN 15 µg/day both with RBV (1.0-1.2 g/day). Prior to study entry, patients had to have <2 log10 decline in viral load (VL) while undergoing
at least 12 weeks of previous pegIFN/RBV therapy or have detectable VL at end of treatment after completing at least 24 weeks of therapy with ≥80% adherence. Patients had a negative VL if virus was undetectable by both bDNA and TMA assays. No adjunctive growth factors were used. Results: Patient demographics included mean age 50 yr, 71% male, 68% high viral load, 94% genotype 1, mean weight 89 kg, 17% African American, and 67% Caucasian. Other important patient characteristics included 59% with evidence of bridging fibrosis or cirrhosis on biopsy and 79% null responders (<2log_{10} drop in VL during their previous pegIFN/RBV). In the intent-to-treat analysis, SVR rates were 5% and 10% for CIFN 9µg/day and CIFN 15µg/day, respectively. SRV rates by previous response to therapy and fibrosis score for available patients are listed in Table 1. Discontinuations due to adverse events occurred in 11% and 17% in the CIFN 9µg/day and CIFN 15µg/day arms, respectively. Conclusions: Use of daily CIFN plus RBV in patients with advanced liver disease who were primarily null responders to previous pegIFN/RBV therapy resulted in viral clearance in a dose-dependent manner. Non-cirrhotic patients who achieved a partial response on their previous pegIFN/RBV treatment achieved the best outcomes, which approached 30% SVR. Daily CIFN up to 15µg/day and RBV was well tolerated in this population of pegIFN/RBV non-responders.

169 CONFIRMATION OF THE GENES ENCODING THE BILARY CHOLESTEROL TRANSPORTER ABCG5/ABCG8 AS GALLSTONE SUSCEPTIBILITY (LITH) GENES

Ulrike Kurtz1, Daniel Teusner2, Albrecht Hofmeister3, Joachim Massner4, Henning Wittenburg1; 1Department of Medicine II, University of Leipzig, Leipzig, Germany; 2Institute of Laboratory Medicine, University of Leipzig, Leipzig, Germany

Introduction: Employing quantitative trait locus (QTL) mapping in the inbred mouse model of cholesterol cholelithiasis, we identified the Lith9 locus on murine chromosome 17. Lith9 co-localized with the positional candidate genes Abcg5 and Abcg8 and Lith9-susceptible mouse strains displayed higher hepatic mRNA expression levels of both genes compared with Lith9-resistant strains. The ABCG5/ABCG8 heterodimer is expressed in liver and small intestine and limits intestinal absorption and promotes biliary secretion of cholesterol and plant sterols. Methods: To confirm Abcg5/Abcg8 as Lith genes, we performed a QTL analysis for plasma plant sterol levels in F2 progeny harboring a susceptible Lith9 allele displayed significantly lower plasma plant sterol levels (P < 0.001). In congenic mice carrying a resistant Abcg5/Abcg8 allele, plasma cholesterol and phytosterol levels were significantly higher compared with C57BL/6 controls. Lower hepatic expression levels of Abcg5 (P < 0.001) correlated with lower biliary cholesterol levels (P < 0.05) in congenic mice compared with C57BL/6 controls substantiating Abcg5/Abcg8 as Lith genes. However, lower intestinal expression of Abcg5 and higher plasma phytosterol levels indicated more efficient cholesterol absorption that resulted in substantial macrovesicular hepatic steatosis in Lith9-resistant congenic mice. Conclusion: Our data validate lithogenic alleles of Abcg5/Abcg8 that contribute to lower serum phytosterol levels and decrease hepatic steatosis but increase the risk of cholesterol gallstone formation in mice. The findings underscore the concept of Abcg5/Abcg8 as a principle cause of cholesterol gallstone susceptibility and indicate complex consequences of lipid metabolism from dys-regulated canalicular and intestinal cholesterol transport.

170 A NOVEL ROLE OF TRANSFORMING GROWTH FACTOR β 1 IN TRANSCRIPTIONAL REPRESSION OF THE CHOLESTEROL 7 α -HYDROXYLASE GENE IN HUMAN HEPATOCYTES

Tiangang Li, John Chiang; Department of Biochemistry and Molecular Pathology, Northeastern Ohio University College of Medicine, Rootstown, OH

Bile acids are synthesized from cholesterol exclusively in the liver. Cholesterol 7 α-hydroxylase (CYP7A1) is the rate-limiting enzyme in the bile acid biosynthetic pathway and plays a key role in maintaining bile acid homeostasis. Inhibition of CYP7A1 by bile acids and inflammatory cytokines provides an important mechanism for protecting hepatocytes from bile acid toxicity during cholestatic liver diseases. Transforming growth factor β 1 (TGF β 1) released by hepatic stellate cells during chronic liver injury plays a critical role in liver inflammation and fibrogenesis. Objective: to investigate the role of TGF β 1 in hepatic bile acid synthesis. Methods & Results: Quantitative real-time PCR analyses showed that TGF β 1 strongly inhibited the mRNA expression of CYP7A1 in primary human hepatocytes. Reporter assays showed that Smad3, a downstream transcription factor mediating TGF β receptor signaling, inhibited CYP7A1 promoter activity by reducing hepatocyte nuclear factor 4 α (HNF4 α ) binding to the CYP7A1 gene. Adenovirus-mediated Smad3 gene transfer inhibited the CYP7A1 mRNA expression. The histone deacetylase (HDAC) inhibitor Tricostatin A partially blocked the TGF β 1 inhibition of CYP7A1 mRNA expression. Chromatin immunoprecipitation (ChIP) assays showed that TGF β 1 decreased acetylation of histone H3 in the CYP7A1 chromatin. ChIP assays also revealed that TGF β 1 treatment or adenovirus-mediated Smad3 gene transfer reduced HNF4 α and co-activator CBP binding but increased the recruitment of Smad3, HDAC1 and a repressor mSin3A to the CYP7A1 chro-
matin. Conclusion: This study provides the first evidence that TGF β 1 represses CYP7A1 gene transcription in human hepatoctyes by a mechanism involving Smad3-dependent inhibition of HNF4α and recruitment to CYP7A1 chromatin. The TGF β 1 /Smad3 signaling may reduce bile acid synthesis in the liver and prevent hepatocyte injury in obstructive liver diseases.

The angiotensin type I receptor (AT1) plays a critical role in pressure-induced vascular growth. In addition to ligand-dependent activation, AT1 also functions as a mechanoreceptor. Although marked cholangiocyte proliferation occurs during obstructive cholestasis, a condition associated with increased biliary pressure (Gastro 1990;466:77), the role of AT1 in this process remains unclear. AIM: To address role of AT1 stimulation in the regulation of cholangiocyte growth. METHODS: In vivo, normal and bile duct ligated (BDL) rats were treated after surgery with angiotensin II (Ang II; 50 ng/Kg BW/min), a potent ligand for AT1, by osmotic minipump for 2 wks. Biliary growth was assessed by evaluation of PCNA immunohistochemistry and the number of bile ducts in liver sections.

172 PI3K-INDEPENDENT ACTIVATION OF P38MAPK IS REQUIRED FOR CAMP-STIMULATED MRP2 TRANSLLOCATION IN HEPATOCYTES

Christopher Schonhoff1, Cynthia R. Webster2, Mohammed S. Anwer1; 1Biomedical Sciences, Tufts Cummings School of Veterinary Medicine, North Grafton, MA; 2Clinical Sciences, Tufts Cummings School of Veterinary Medicine, North Grafton, MA

Cyclic AMP stimulates translocation of bile salt export pump (Bsep) and multidrug resistance associated protein 2 (Mrp2) to the canalicular membrane in rat hepatocytes; the effect of cAMP on Bsep translocation is phosphoinositide-3-kinase (PI3K) independent. A PI3K-independent activation of p38 MAPK may be involved in taurolursodeoxycholate (TUDC)-induced increases in bile acid secretion and Bsep translocation. Since, TUDC stimulates Mrp2 translocation and cAMP activates p38 MAPK in hepatocytes, we hypothesized that p38 MAPK may mediate cAMP-induced Mrp2 translocation. This hypothesis was tested in the present study conducted in isolated rat hepatocytes and in the human hepatoma cell line HuH-7. Cells were treated with 100 μM chlorophenylthio-cAMP (CPT-cAMP) for 15 min followed by determination of Mrp2 translocation and p38 MAPK activity. Mrp2 translocation was determined using a biotinylation method to label membrane Mrp2 followed by streptavidin precipitation of biotin-labeled proteins and immunoblotting with Mrp2 antibody. The activity of p38 MAPK was assessed from phosphorylation of p38MAPK ([I]180/182) in cell lysates. In isolated rat hepatocytes, CPT-cAMP increased Mrp2 translocation and p38 MAPK activity by 65±10% and 80±11% (mean±SEM), respectively. These effects of CPT-cAMP were almost completely inhibited by SB203580 (1 μM), an inhibitor of p38 MAPK. Wortmannin (50 nM), a specific inhibitor of PI3K, did not inhibit CPT-cAMP-induced activation of p38 MAPK, indicating PI3K-independent activation of p38 MAPK by cAMP. To further define the role of p38 MAPK, HuH-7 cells were transiently transfected with constitutively active (CA) or dominant negative (DN) Flag-cAMP kinase 6 (M KK6), an upstream kinase responsible for the activation of p38 MAPK. Transfection using LipofectAMINE was confirmed by expression of M KK6 using an antibody against Flag. CA-MKK6 increased p38 MAPK activity and Mrp2 translocation by 150±45% and 49±8%, respectively, compared to the empty vector, and these effects were not further augmented by CPT-cAMP. Basal and CPT-cAMP-induced p38 MAPK activity was not affected in cells transfected with DN-MKK6. Since p38 MAPK can also be activated by M KK3, any inhibition by DN-MKK6 may have been compensated by M KK3-mediated activation. In agreement with this possibility, basal and CPT-cAMP induced activation of p38 MAPK was inhibited in DN-MKK3/6 transfected cells. DN-MKK3/6 also inhibited CPT-cAMP-induced Mrp2 translocation. Taken together, these results suggest that PI3K-independent activation of p38 MAPK by cAMP is required for Mrp2 translocation in hepatocytes.
173 THE STEROID RECEPTOR CO-ACTIVATOR 2 (SRC2) REGULATES THE EXPRESSION OF THE FXR TARGET GENES, BILE SALT EXPORT PUMP (ABC1B1) AND SMALL HETERO DIMER PARTNER (SHP)

Martin J. Walsh, Meena Ananthanarayanan, Side Li, Natarajan Balasubramaniyan, Frederick J. Suchy; Department of Pediatrics, Mount Sinai School of Medicine, New York, NY

The steroid receptor coactivators, including SRC-2, also known as GRIP1/TIF2, are well established nuclear receptor (NR) coactivators that are known to mediate the transcriptional effects of liganded NRs by directly recruiting other accessory factors and by their ability to modify histones by acetylation. To assess the independent utilization of these co-activators for FXR-mediated transcription, we studied whether FXR can utilize either SRC1 or SRC2 in gene activation within the context of the loci of the Bile Salt Export Pump (BSEP) and the small heterodimer partner (SHP). HepG2 cells were transfected with a plasmid for mammalian expression of FXR and siRNAs for SRC1 and SRC2 (Dharmacon/Pierce). There was a significant decrease in the amount of endogenous levels of SRC1 and SRC2 mRNAs measured by qRT-PCR upon transfection with siRNA for each co-activator. Protein levels were also markedly reduced on immunoblot analysis with antisera directed against SRC1 and SRC2 (Bethyl Labs). To determine the effect on specific gene expression associated with regulation by FXR, we measured BSEP and SHP mRNAs from cells transfected with FXR and treated with CDCA. Our results demonstrate that endogenous levels of BSEP and SHP mRNA are reduced in parallel with the loss of SRC2 induced by siRNA whereas, the loss of SRC1 by siRNA had an insignificant effect on the endogenous levels of BSEP and SHP. In accordance with the results showing that SRC2 is specific for FXR-mediated control of BSEP, we examined chromatin of the HepG2 cells targeted by siRNA of SRC1 and SRC2 for the occupation of the BSEP promoter by the co-activators. The loss of SRC2 at the BSEP and SHP loci on chromatin immunoprecipitation analysis is consistent with the knockdown of SRC2 expression by siRNA. On Chip, siRNA knockdown of SRC2 also depletes several histone modifications essential for the function of FXR including H3R17 and H3K4 methylation and H3K9 acetylation. These data are supported further by the downregulation of BSEP mRNA on microarray analysis of src2/- mouse livers (Jeong, et al Mol.Endo.20:1138, 2006). We conclude that SRC2 is critical for ligand-induced activation of FXR target genes, and selectively regulates the expression of BSEP and SHP.

174 CHARACTERIZATION OF MICE NULL FOR LIVER-SPECIFIC UPTAKE TRANSPORTER ORGANIC ANION TRANSPORTING POLYPEPTIDE 1B2 (OATP1B2)

Hong Lu1, Supratim Choudhuri2, Kenichiro Ogura1, Ivan Csanaky1, Pei-zhen Song1, Xiaohong Lei1, Chuan Chen1, Xingguo Cheng1, Curtis Klaassen1; 1Pharmacology, Toxicology & Therapeutics, University of Kansas Medical Center, Kansas City, KS; 2Food and Drug Administration, College Park, MD

Introduction. The liver-specific basolateral uptake transporter Oatp1b2 transports a large variety of substrates including organic anions, organic cations, and neutral chemicals. It has been perceived that Oatp1b2 may be essential for hepatic uptake of endobiotics and xenobiotics. To elucidate the in vivo function of Oatp1b2, we produced Oatp1b2-null mice and characterized their phenotype. Methods. Oatp1b2 gene was disrupted by homologous recombination and backcrossed into C57BL/6 mice for 6 generations. Hepatic mRNA and protein expression of transporters were determined with branched DNA signal amplification assay and Western blot, respectively. Results. Oatp1b2 protein is absent in liver of Oatp1b2-null mice. Compared to wild-type mice, Oatp1b2-null mice had higher hepatic mRNA expression of the uptake transporter Oatp1a4 and lower organic anion transporter 2. Oatp1b2-null mice were generally healthy and physically indistinguishable from wild-type mice. However, Oatp1b2-null mice developed moderate conjugated hyperbilirubinemia. After intra-arterial injection of unconjugated bilirubin, compared to wild-type mice, Oatp1b2-null mice had as much as 5-fold higher blood levels of conjugated bilirubin, which persisted at least 50 min. Oatp1b2-null mice were completely resistant to hepatotoxicity induced by the mushroom toxicant phalloidin, an Oatp1b2-specific substrate identified in vitro, whereas Oatp1b2-null mice and wild-type mice were similarly sensitive to hepatotoxicity induced by the mushroom toxicant alpha-amanitin. The critical role of Oatp1b2 in mediating hepatotoxicity of phalloidin was further confirmed by the lack of cholestasis in Oatp1b2-null mice after intra-arterial injection of phalloidin (2 mg/kg). After intra-arterial injection of dibromosulphosphate (DBSP), a non-metabolizable organic anion used as a liver function assay, blood concentrations of DBSP were 11-fold higher, and accumulative biliary excretion of DBSP was 41% lower, in Oatp1b2-null mice compared to wild-type mice. Conclusion. Oatp1b2 plays a key role in determining hepatic uptake of conjugated bilirubin, phalloidin, and DBSP, whereas biliary excretion of these chemicals is a function of hepatic uptake, intrahepatic biotransformation, and biliary efflux. Oatp1b2-null mice will be a powerful tool to elucidate the physiological role of Oatp1b2 and its human orthologs OATP1B1 and OATP1B3 (supported by NIH grant SRO1ES009649).

175 FINAL RESULTS OF PATIENTS TREATED WITH PEG-INFON-ALFA-2A (PEG-IFN) AND RIBAVIRIN (RBV) FOLLOW-ON THERAPY AFTER 28-DAY TREATMENT WITH THE HEPATITIS C PROTEASE INHIBITOR TELAPREVIR (VX-950), PEG-IFN AND RBV

Maribel Rodriguez-Torres1, Eric J. Lawitz2, John G. McHutchison3; 1Fundacion de Investigacion de Diego, Santurce, PR; 2Alamo Medical Research, San Antonio, TX; 3Duke Clinical Research Institute & Division of Gastroenterology, Duke University, Durham, NC

Purpose: Telaprevir (TVR, VX-950) is an orally administered, highly selective peptidomimetic inhibitor of the Hepatitis C virus (HCV) NS3-4A protease. The VX05-950-102 study was designed to assess the safety of telaprevir when given in combination with Peginterferon alfa-2a (Peg-IFN) and ribavirin (RBV) and to evaluate the antiviral response during 28 days of dosing. After completion of the 28-day study, all subjects received off-study therapy with Peg-IFN/RBV under the clinical care of their physicians. Here we report the outcome of treatment after this post-study therapy. Methods: This study included 12 treatment-naive, mostly Latino (10/12), patients infected with...
176 PRE-TREATMENT PD-1 EXPRESSION ON HCV-SPECIFIC CTLS PREDICTS EARLY AND LONG-TERM RESPONSE TO COMBINATION THERAPY IN AFRICAN AMERICANS BUT NOT CAUCASIAN AMERICANS

Jared Klarquist1, Lucy Golden-Mason1,2, Abdus S. Wahed3, Hugo R. Rosen1,2; 1Division of Gastroenterology & Hepatology, Hepatitis C Center & Department of Medicine, University of Colorado Health Sciences Center, Denver, CO; 2Integrated Program in Immunology, University of Colorado Health Sciences Center & National Jewish Hospital, Denver, CO; 3Department of Biostatistics, Graduate School of Public Health, University of Pittsburgh, Denver, CO

African Americans (AA) with chronic HCV are less likely to have a sustained virological response (SVR) to IFN-based antiviral therapy than Caucasian Americans (CA), but mechanisms for these differences are not fully elucidated. Host immune responses are postulated to affect viral kinetics and ultimate outcome of treatment. Aim: To assess the association of PD-1, recently shown to be an important marker for CTL exhaustion, with early viral decline and ultimate response to treatment in AA and CA with chronic HCV. Methods: 72 genotype 1 patients (30 AA, 42 CA) with chronic HCV were selected from prospectively characterized patients, pre-treatment PD-1 expression on HCV-specific CTLs was significantly, inversely associated with SVR (RR=0.95; 95% CI 0.93-0.97; p<.0001). This association, however, was not significant in CA (Figure). Conclusions: In this large cohort of prospectively characterized patients, pre-treatment PD-1 expression on HCV-specific CTLs was associated with early and long-term virologic response to combination antiviral therapy in AA but not CA patients. These findings suggest that immune factors may contribute to the poor antiviral responses found among AA patients with hepatitis C and provide potential immune targets for manipulation.

177 INTERIM ANALYSIS RESULTS FROM A PHASE 2 STUDY OF TELAPREVIR WITH PEGINTERFERON ALFA-2A AND RIBAVIRIN IN TREATMENT-NAIVE SUBJECTS WITH HEPATITIS C

Ira M. Jacobson1, Gregory T. Everson2, Stuart C. Gordon3, Robert Kaufmann3, Lindsay McNair4, Andrew Muir5, John G. McHutchison1; 1Division of Gastroenterology and Hepatology, Weill Cornell Medical College, New York, NY; 2Division of Gastroenterology and Hepatology, University of Colorado Health Science Center, Denver, CO; 3Division of Gastroenterology and Hepatology, Henry Ford Hospital, Detroit, MI; 4Vertex Pharmaceuticals, Cambridge, MA; 5Duke Clinical Research Institute, Duke University Medical Center, Durham, NC

Background: The VX05-950-104 study (PROVE1) is a randomized, placebo-controlled Phase 2 study of telaprevir (TVR, VX-950), an HCV protease inhibitor, with Peg-IFN-2a and RBV, in naive subjects with genotype 1 hepatitis C. We report the...
results of a planned interim analysis. Methods: Subjects were randomized into 4 groups; 3 groups received TVR 750 mg q8h, Peg-IFN-2a 180 µg/week, and RBV 1000-1200 mg/day for 12 weeks followed by 0 (n=20), 12 (n=80) or 36 (n=82) weeks of Peg-IFN-2a and RBV (TVR/PR groups). The control group (n=81) received up to 48 weeks of Peg-IFN-2a/RBV (PR). This analysis was performed when all treated subjects had completed 12 weeks of dosing. Follow-up information was also obtained for the subjects who completed the 12-week dosing arm. Plasma HCV RNA was isolated for viral sequencing at baseline and at each HCV RNA assessment in samples that contained greater than 1,000 IU/mL. Results: The proportion of subjects with undetectable HCV RNA (LOD 10 IU/mL) at Week 4 was 79% (TVR/PR group), and 11% (control group) (p<0.001), and at Week 12 was 70% (TVR/PR group), and 39% (control group) (p<0.001). Viral breakthroughs (increase of >1-log above HCV RNA nadir) with previously described TVR resistant variants were observed in 12 of 175 (11 genotype 1a and 1 genotype 1b) subjects in the TVR/PR groups. In the group assigned to 12 weeks of treatment, 6 of 9 subjects with RVR and completing 12 weeks of treatment achieved SVR. The remaining 3 subjects relapsed with TVR resistant variants (genotype 1a: R155T/I). Discontinuations due to adverse events were more frequent in the TVR/PR group (11% vs. 3%). Rash, gastrointestinal events and anemia were more common, and rashes more severe in the TVR/PR groups. An additional interim analysis will be conducted when all subjects have completed 36 weeks on-study, including 12-week post-treatment follow-up for the 24-week study arm subjects. Conclusions: Compared with standard therapy, significantly more subjects receiving a TVR/PR regimen achieved undetectable HCV RNA at Weeks 4 and 12, and some subjects achieved an SVR after 12 weeks of TVR/PR. Other patients relapsed with TVR-resistant variants, suggesting that 12 weeks of TVR/PR may be adequate to eliminate wild-type virus. The post-treatment follow-up results in the 24-week study groups will evaluate whether the additional 12 weeks of PR is sufficient to eliminate the remaining TVR-resistant variants. * for the PROVE1 study team

180 SUSTAINED VIROLOGIC RESPONSE RATES WITH ALBINTERFERON ALFA-2B PLUS RIBAVIRIN TREATMENT IN IFN-NAIVE, CHRONIC HEPATITIS C GENOTYPE 1 PATIENTS

Stefan Zeuzem1, Eric M. Yoshida2, Yves Benhamou3, Vincent G. Bain4, Daniel Shouval2, Stephen Pianko5, Robert Flisiak7, Mircea Grigorescu5, Vratslav Rehak8, Kelly D. Kaita10, Patrick Cronin11, Erik Pulkstenis11, G. M. Subramanian11, John G. Mchutchison12, 1 J.W. Goethe-University Hospital, Frankfurt, Germany; 2 University of British Columbia, Vancouver, BC, Canada; 3 Hospital Pitie-Salpetriere, Paris, France; 4 University of Alberta, Edmonton, AB, Canada; 5 Hadassah University, Hadassah, Israel; 6 Monash University, Melbourne, VIC, Australia; 7 Medical University of Białystok, Białystok, Poland; 8 Spitalul Clinic, Cluj-Napoca, Romania; 9 Nuselska poliklinika, Prague, Czech Republic; 10 University of Manitoba, Winnipeg, MB, Canada; 11 Human Genome Sciences, Rockville, MD; 12 Duke Clinical Research Institute, Durham, NC

Aim/Background: This Phase 2b study evaluates the efficacy and safety of albinterferon alfa-2b (alb-IFN), a novel recombinant protein consisting of IFNα-2b genetically fused to human albumin, in combination with oral ribavirin (RBV) in IFN-naïve, chronic hepatitis C genotype 1 patients. Methods: 458 patients were randomized to 4 treatment arms: PEG-IFNa-2a 180mcg Q1w (PEG-IFN) or one of 3 alb-IFN arms (900mcg Q2w, 1200mcg Q2w or 1200mcg Q4w), all in combination with weight-based oral RBV1000-1200 mg/d (Table). HCV RNA was measured by real-time PCR (limit of detection [LOD]): 10 IU/ml. The primary efficacy endpoint was sustained virologic response (SVR) defined as HCV RNA<LOD at w24 following treatment completion. Results: By ITT analysis, SVR rates were 58.5% for the 900Q2, 55.5% for 1200Q2, 50.9% for 1200Q4 and 57.9% for PEG-IFN (Table). In patients with ≥80% adherence to therapy, SVR rates were 71.6% for the Q2w alb-IFN arms compared to 66.7% for PEG-IFN. Of note, in heavier patients (≥75 kg) adherent to therapy, SVR rates were maintained for the alb-IFN arms and declined for PEG-IFN. Discontinuations due to adverse events in the alb-IFN arms were 9.3% in the 900Q2, 18.2% in the 1200Q2 and 12.1% in the 1200Q4 compared with 6.1% for PEG-IFN. Hematology reductions were lowest in the Q4w arm and comparable across other arms. Quality-of-life as measured by SF-36v2 and missed work was significantly more favorable for the 900Q2 arm. Conclusions: These data suggest that the Q2w alb-IFN may offer comparable efficacy, with an improved dosing schedule and quality-of-life compared with current standard of care with PEG-IFN.

IMPORATANCE OF A MINIMAL RESIDENT VIREMIA FOR THE RELAPSE PREDICTION IN HCV TYP1 PATIENTS RECEIVING STANDARD OR INDIVIDUALIZED TREATMENT DURATION

Thomas Berg1, Viola Weich1, Gerlinde Teuber2, Hartwig Klinker3, Bernd Möller4, Jens Rasenack5, Holger Hinrichsen6, Tilman Gerlach7, Ulrich Spengler8, Peter Buggisch9, Heike Balk10, Myrga Zankel10, Christoph Sarrazin10, Stefan Zeuzem10,11

The exact estimation of early virologic response rates in the course of antiviral therapy is an important goal in order to improve individualized therapeutic strategies in HCV infection. The sensitive TMA test could provide better advantage to distinguish at early stages sustained from non-sustained responders. We evaluated HCV type 1 patients who took part in a prospective study asking whether the application of TMA in bDNA-negative patients may be a better indicator to predict long-term outcome of the HCV infection. Methods 433 patients were randomized to receive either 1.5ug/kg PEG-INFα-2b plus 800-1400 mg RBV for 48 weeks (n=225, group A) or an individualized tailored treatment duration (n=208, group B). In the latter group treatment duration was calculated by the time required to become for the first time HCV RNA negative as defined by bDNA assay (detection limit 615 IU/ml) multiplied by the factor 6. HCV RNA levels were quantified weekly until week 8, at week 12 and 24. For all those patients who were bDNA negative the more sensitive TMA test (detection limit 5.3 IU/ml) was also prospectively assessed. The different response groups were classified according to the HCV RNA levels at week 4 and 12 (Table). Results Table shows the relevant data and refers to the relative relapse rates in group A and B at week 4 and 12 in relation to the treatment schedule. There is clear evidence for a high relapse rate in patients with a positive TMA within the first 12 weeks of therapy being more pronounced when treatment duration shortened in the individualized treatment group. In contrast patients shown to respond as early as week 4 evidenced by a negative TMA test had relapse rates below 10% irrespectively from treatment group. Conclusion The application of the highly sensitive HCV RNA tests must be distinguished at early stages sustained from non-sustained response (SVR) defined as HCV RNA<LOD at w24 following treatment schedule and quality-of-life compared with current standard of care with PEG-IFN.
Liver fibrosis was staged according to the METAVIR scoring system (0 = no fibrosis, 1 = slight fibrosis, 2 = significant fibrosis, 3 = cirrhosis). Combinations of these methods were assessed by multivariate regression. Results: Mean age was 47.26 (17-69) years, BMI 27.5 (17.2-57.8), LB length 15 mm (median 22 mm, range 15-50 mm) within one month.

The effect of age, gender, BMI, LB length, activity grade, LSM, and histological assessment were observed in 28 cases (11%). Discordances of at least 2 stages between LSM and histology were observed in 8/127 cases (6.3%) versus 20/127 cases (15.7%), P < 0.02, respectively. In patients with IQR/LSM > 0.2 versus < 0.2, for the diagnosis of liver fibrosis F ≥ 2, F ≥ 3 and cirrhosis, AUROC were 0.77 versus 0.83 (P = 0.18), 0.79 versus 0.91 for (P < 0.01) and 0.86 versus 0.95 (P = 0.11), respectively.

Conclusion: IQR/LSM is a key factor of accuracy of FibroScan for the diagnosis of liver fibrosis. This ratio significantly improves the performance of FibroScan for the diagnosis of extensive fibrosis [F3]. In case of IQR/LSM > 0.2, a new measurement of LS or a LB should be proposed. 1) Castera et al. Gastroenterology 2005;128:343-50.

### 183 TRANSIENT ELASTOGRAPHY IN PATIENTS WITH NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD)

Masato Yoneda1, Hironori Mawatari1, Takuma Higurashi1, Hiroshi lida1, Yuichi Nozaki1, Hiroki Endo1, Koji Fujita1, Hisayuki Kirikoshi1, Masaya Tamano2, Masashi Yoneda2, Hideyuki Hiraishi2, Kenseke Kubota2, Satoru Saito2, Atsushi Nakajima1; 1Division of Gastroenterology, Yokohama City University School of Medicine, Yokohama, Japan; 2Division of Gastroenterology, Dokkyo Medical School, Mibu, Japan

**Background and aims** The histopathological changes in NAFLD range over a wide spectrum, extending from simple steatosis to nonalcoholic steatohepatitis (NASH). Liver fibrosis is the main predictor of the progression of NAFLD. Transient elastography (FibroScan; EchoSens, Paris, France), which measures liver stiffness, is a novel, noninvasive and rapid method to assess liver fibrosis. Studies have suggested that this technique is useful for the accurate prediction of hepatic fibrosis in patients with chronic hepatitis C. We have previously reported a pilot study that transient elastography have the possibility of the measurement of the fibrosis in patients with NAFLD (GUT 2007). We prospectively investigated the usefulness of liver stiffness measurement (LSM) in the evaluation of liver fibrosis in patients with nonalcoholic fatty liver disease (NAFLD).

**Methods** Transient elastography was performed in LSM in 97 patients with histologically confirmed NAFLD. Moreover, we investigated the relationship between LSM and the serum levels of hyaluronic acid and type IV collagen 7s domain. (Result) The median liver stiffness values (and 95% CI) were F0, 4.907 (4.417 – 5.396) kPa; F1, 6.142 (5.582 – 6.702) kPa; F2, 7.894 (6.384 – 9.404) kPa; F3, 11.027 (8.555 – 13.500) kPa; F4, 26.960 (17.705 – 36.215) kPa. The liver stiffness was well correlated with the stage of liver fibrosis (r ≥ 0.865 for ≥ F 1, r ≥ 0.904 for ≥ F 2, r ≥ 0.991 for ≥ F 3, r ≥ 0.865 for ≥ F 2, r ≥ 0.904 for ≥ F 3, r ≥ 0.991 for ≥ F 3). Liver stiffness was also strongly correlated with the serum levels of hyaluronic acid and type IV collagen 7s domain.

**Conclusion** This is the first study to demonstrate a consistent and profound elevation of the liver stiffness in NASH patients, as confirmed by the results of liver biopsy, which remains the gold standard for evaluation of the severity of liver fibrosis in patients with NASH. Measurement of liver stiffness is a non-invasive and clinically useful method for predicting the severity of liver fibrosis in patients with NASH.

### 184 COMPARISON OF MR ELASTOGRAPHY, ULTRASOUND ELASTOGRAPHY AND APRI FOR THE NON-INVASIVE ASSESSMENT OF LIVER FIBROSIS

Laurent Huwart, Christine Sempoux, Najat Salameh, Laurence Annet, Yves Horsmans, Bernard Van Beers; Université Catholique de Louvain, Brussels, Belgium

**Introduction** Recently, magnetic resonance (MR) elastography has emerged as a non-invasive method to assess the fibrosis stage. The purpose of our study was to prospectively compare the diagnostic accuracy of MR elastography, ultrasound elastography, and aspartate aminotransferase to platelets ratio index (APRI) for the staging of fibrosis in patients with chronic liver disease. Materials and methods: Ninety-six patients who had liver biopsy for suspicion of chronic liver disease had MR elastography, ultrasound elastography and APRI within 2 days. Fibrosis stage was assessed by two pathologists according to the METAVIR score (from F0 to F4) that served as reference. MR elastography was performed with a 1.5 Tesla scanner using a motion-sensitized sequence and a transducer that applied mechanical waves into the liver. Ultrasound elastography was performed with the commercially available FibroScan. The measurements of MR elasticity, ultrasound elasticity and APRI were analyzed with receiver operating characteristic curves. Results: The distribution of fibrosis stage was F0 in 22/96 patients (23%), F1 in 22 (23%), F2 in 19 (20%), F3 in 15 (15%) and F4 in 18 (19%). The areas under the receiver operating characteristic curves of MR elastography (0.994 for F ≥ 2, 0.985 for F ≥ 3 and 0.998 for F = 4) were significantly (P < 0.05) larger than those of ultrasound elastography, APRI and the combination of ultrasound elastography and APRI (respectively 0.837, 0.709 and 0.849 for F ≥ 2; 0.906, 0.816 and 0.936 for F ≥ 3; 0.930, 0.820 and 0.944 for F = 4). The most discriminant cut-off values of MR elasticity were respectively 2.5 kPa for F ≥ 2, 3.1 kPa for F ≥ 3, and 4.1 kPa for F = 4. Conclusion: The results of this study show that MR elastography is more accurate than ultrasound elastography and APRI to stage liver fibrosis and suggest that MR elastography can be used for the assessment and follow-up of liver fibrosis.

**Table** Most discriminant MR elasticity cut-off values (kPa) and corresponding sensitivities, specificities, positive and negative predictive values with 95% confidence intervals in parentheses for METAVIR scores F ≥ 2, F ≥ 3 and F = 4.

FIBROTEST VERSUS LIVER BIOPSY: AN INDEPENDENT MULTICENTER EVALUATION OF PERFORMANCE

Maria Guido1, Alfredo Alberti2, Giorgio Bellati3, Guido Collaredo4, Antonio Craxi2, Vita Di Marco5, Stefano Fagiuoli6, Matteo Fassan1, Luciano Giacomelli1, Alessandra Mangia7, Giada Sebastiani2, Massimo Rugge1; 11. Anna Hospital, Como, Italy; 4Policlinico San Pietro, Bergamo, Italy; 5Department of Gastroenterology, University of Palermo, Palermo, Italy; 6Ospedali Riuniti, Bergamo, Italy; 7IRCSS Casa Sollievo della Sofferenza, S. Giovanni Rotondo, Italy

BACKGROUND AND AIMS: Algorithms based on indirect biochemical markers of fibrosis are becoming increasingly popular. Though the Fibrotest (FT) is accredited for the non-invasive assessment of liver fibrosis, its validation against liver biopsy comes mainly from data generated by the center where it was originally developed. In an independent nationwide multicenter study, we aimed to assess the diagnostic accuracy of FT in a large series of patients with chronic hepatitis B and C undergoing liver biopsy (LB) for disease grading and staging. This is the first multicenter study in which all liver biopsies were reviewed at a single center by the same experienced liver pathologist. METHODS: In all, 496 consecutive patients with chronic HBV (55 cases) or HCV hepatitis were enrolled at five centers where liver biopsies and biochemical markers were collected on the same day. All subjects were HIV negative. The diagnostic value of the FT was assessed, applying logistic regression as a discriminant function, in terms of area under the ROC curve (AUCs), sensitivity, specificity, PPV, NPV, general agreement, and kappa score. Liver biopsies more than 2 cm long & with ≥ 11 complete portal tracts (= 277 cases) were considered the “platinum” standard: all analyses were repeated in these biopsies to test the hypothesis that FT might significantly improve its diagnostic accuracy with a better gold standard, assuming that the discrepancy between FT and LB is due mainly to poor biopsy quality. RESULTS: 73% of the biopsy samples were ≥ 2 cm long (median 2 cm; range: 0.5–6.5). According to the METAVIR score, histological fibrosis was F0 in 8% (39/496) of cases, F1 in 29% (142/496), F2 in 35% (176/496), F3 in 13% (63/496), and F4 in 15% (76/496). FT proved scarcely able to discriminate between single fibrosis stages and 34% of cases had intermediated values and cannot be classified. Table 1 summarizes the diagnostic value of FT in discriminating between absent/mild fibrosis and severe fibrosis/cirrhosis. The results did not change when the analysis was restricted to the “platinum” standard biopsies. CONCLUSIONS: FT performs best in discriminating severe fibrosis/cirrhosis from absent/mild fibrosis, but it does not accurately predict the various intermediate stages of fibrosis. Its performance does not improve significantly with better-quality liver biopsies.

PROSPECTIVE COMPARISON OF TWO ALGORITHMS COMBINING NON INVASIVE TESTS FOR STAGING OF LIVER FIBROSIS IN CHRONIC HEPATITIS C

Laurent Castera1,2, Giada Sebastiani3, Brigitte Le Bail4, Victor de Ledinghen4, Patrice Couzigou1, Alfredo Alberti3; 1Hepatology, Hospital Haut Leveque, CHU Bordeaux, Bordeaux, France; 2Hepatology, Hopital St Andre, CHU Bordeaux, Bordeaux, France; 3Venetian Institute of Molecular Medicine, Padova, Italy; 4Pathology, Hospital Pellegrin, CHU Bordeaux, Bordeaux, France

Background: Non invasive assessment of liver fibrosis is a challenging area. Numerous markers are available but their performance may be better when combined. Two algorithms have been proposed recently in patients with chronic hepatitis C, combining either transient elastography (Fibroscan) and Fibrotest (Castera et al. Gastroenterology 2005) or Fibrotest and AST to Platelet Ratio (APRI) (Sebastiani et al. J Hepatol 2006). Aim: to prospectively compare the diagnostic performance for significant fibrosis and cirrhosis of these 2 algorithms in the same population. METHODS: 302 consecutive HCV patients (58% male, mean age 52±12 yrs) who undergone liver biopsy (>10mm and 6 portal triads) were studied. Fibroscan, Fibrotest and APRI were performed in the same lab the day of liver biopsy taken as reference. Fibrosis was scored according to the Metavir scoring system. Diagnostic performances were assessed by measuring area under the ROC curve (AUROC). Results: Significant fibrosis (F2-F3-F4) was present in 76% of patients and cirrhosis (F4) in 24%. The mean liver biopsy length was: 20±8 mm. Fibroscan failure was observed in 8 cases (3%). Performance of the 2 algorithms using the cut-offs for APRI and fibrotest of the original studies are shown in the table. For significant fibrosis, Castera algorithm saved 23% more liver biopsies than Sebastiani algorithm but its accuracy was lower (AUROC 0.91 vs. 0.94; accuracy 87.1% vs. 97.0%, respectively). Regarding cirrhosis, Castera algorithm was slightly more accurate (AUROC 0.93 vs. 0.87; accuracy 95.7% vs. 88.7%, respectively) and saved 4% more liver biopsies. However, Castera algorithm was less cost-effective (using both 100% Fibroscan and Fibrotest) than Sebastiani algorithm (using 100% APRI (virtually no cost) and around 50% Fibrotest). Conclusion: Both algorithms are effective for the non invasive staging of liver fibrosis in chronic hepatitis C. Their use in clinical practice could avoid the need for liver biopsy in 48 to 71% of cases for the diagnosis of significant fibrosis and in 74 to 78% of cases for cirrhosis.

DIFFERENTIATION AND ENRICHMENT OF HEPATOCTYES FROM HUMAN EMBRYONIC STEM CELLS IN VITRO AND IN VIVO

Yuyou Duan1, Andreea M. Catana1, Ying Meng1, Naoki Yamamoto1, Songqing He1, Sanjeev Gupta2, Sanjiv S. Gambhir3, Mark A. Zern1, 1Department of Internal Medicine, Transplant Research Program, University of California, Davis Medical Center, Sacramento, CA; 2Medicine and Pathology, Albert Einstein College of Medicine, Bronx, NY; 3Molecular Imaging Program, Stanford University, Stanford, CA

Background: Human embryonic stem cells (hESC) may provide a cell source of functional hepatocytes for therapeutic use. The aim of this study is to develop viable hepatocytes from hESC that can be used for cell-based therapies. Methods: Using a combinatorial approach, we developed culture conditions that differentiated a percentage of hESC along a hepatocyte lineage. The differentiated hESC were further enriched by transducing with a lentiviral vector containing the human α1-antitrypsin (α1-AT) promoter driving the GFP gene. The GFP+ hESC were then purified by laser microdissection and pressure catapulting. In addition, differentiated hESC that were transduced with a lentiviral triple-fusion vector were transplanted into NOD-SCID mice, and the luciferase-induced bioluminescence in the livers was evaluated by a charged coupled device (CCD) camera. Results: After transduction with a lentivirus containing α1-AT promoter, differentiated GFP+ hESC expressed a large series of liver proteins: α1-fetoprotein (AFP), albumin (ALB), α1-AT, transthyretin (TF), tyrosin aminotransferase (TAT), arginase (ARG), glucose-6-phosphatase, CYP1A1, CYP2B6, CYP1B1, CYP2E1, CYP2C9, and CYP3A. AFP expression decreased with time. Differentiated hESC also had liver-specific functions. They accumulated glycogen, expressed high levels of CYP1A2 activity as well as urea synthesis in the livers was evaluated by a charged coupled device (CCD) camera. Results: After transduction with a lentivirus containing α1-AT promoter, differentiated GFP+ hESC expressed a large series of liver proteins: α1-fetoprotein (AFP), albumin (ALB), α1-AT, transthyretin (TF), tyrosin aminotransferase (TAT), arginase (ARG), glucose-6-phosphatase, CYP1A1, CYP2B6, CYP1B1, CYP2E1, CYP2C9, and CYP3A. AFP expression decreased with time. Differentiated hESC also had liver-specific functions. They accumulated glycogen, showed the cellular uptake of indocyanine green, and expressed high levels of CYP1A2 activity as well as urea synthesis. Quantitative RT-PCR revealed that the expression levels of purified hESC over time, when compared with primary human hepatocytes, ranged from 24 to 55% for ALB, 44 to 57% for α1-AT, 73 to 91% for TF, 13 to 61% for TAT, and 128 to 230% for ARG. When NOD-SCID mice were transplanted with the differentiated hESC transduced with a lentiviral triple fusion vector, positive signals were obtained by CCD camera over time. The differentiated hESC survived and engrafted in mouse livers, and the first bioluminescence imaging of hESC in the liver. Successful transplantation of differentiated hESC into an animal liver, and the first bioluminescence imaging of hESC in the liver. Thus, we exploited a novel system for directing and enriching hepatic differentiation from hESC.

IDENTIFICATION OF ADULT HEPATIC PROGENITOR/oval CELLS CAPABLE OF REPULATING INJURED RAT LIVER

Mariana D. Dabeva1, Milad I. Yavchev1, Petar N. Grozdanov1, Hongchao Zhou2, Chandan Guha2; 1Department of Medicine, Albert Einstein College of Medicine, Bronx, NY; 2Department of Radiation Oncology, Albert Einstein College of Medicine, Bronx, NY

Adult hepatic progenitor/oval (AHPC/OC) cells appear and regenerate the liver when hepatocyte proliferation is compromised. Many different markers have been attributed to these cells but their nature remains still obscure. This study is a detailed gene expression analysis aimed at revealing their identity and their repopulating capacity after transplantation into injured rat liver. Two models for activation and proliferation of OC were used: 2-acetylaminofluorene treatment in conjunction with partial hepatectomy, and D-galactosamine induced liver injury. One 2-AAF pellet (35 mg/14 day release) was implanted subcutaneously and seven days later two-thirds PH was performed. The rats were sacrificed on day 10. D-glal was injected i.p. at a dose of 130 mg/100g body weight and the liver taken on day 5. Gene expression of purified OC was studied with Affymetrix Rat Expression Array 230 2.0, by RT-PCR and immunofluorescent microscopy (IFM). Two major and distinct populations of cells in the OC compartment were identified: EpCAM+ and Thy-1+ cells. EpCAM+ cells express mRNA for liver enriched transcription factors; known (Afp, Ck19, Dlk1, Ggt etc.) and novel (Aqp5, Cd24, Cd44, claudin-4, Cdk133, cadherin 22, claudin-7, mucin-1 etc.) OC markers, some of which are shared by cholangiocytes and hepatoblasts but others are unique. The co-expression of EpCAM and other OC markers (AFP, Ck19, Dlk1, Ggt, Cd24, alpha6-integrin, claudin-7, Cd24) was confirmed with (IFM). OC do not express hematopoietic stem cell markers: c-kit, SCF, Cd34 confirmed by quantitative RT-PCR but they express a number of mesenchymal markers, including vimentin, mesothelin, BMP7, TWEAK receptor, which reveals their epithelial/mesenchymal nature. Thy-1+ cells do not express any OC markers determined by microarrays of isolated cells and IFM. These cells have the phenotype of activated myofibroblasts: they express collagen type 1, alphaSMA and growth factors (HGF, BMP2), but they also express inflammatory cytokines, like IL6 and TNFα. Transplantation experiments revealed that EpCAM+ can reconstitute completely retorsine/partial hepatectomy preconditioned rat liver, while Thy-1+ cells do not. We conclude that EpCAM+ cells are the true AHPC. These cells have dual epithelial/mesenchymal phenotype and may originate from mesenchoderm. AHPC are a valuable candidate for liver cell therapy. We suggest that Thy-1+ cells are myofibroblasts or transdifferentiated stellate cells, which expand in parallel with activated oval cells. They are major supporting cells producing inflammatory cytokines and growth factors necessary for activation and proliferation of oval cells. Supported by NIH grant R01 DK59321

189 ISOLATION AND EXPANSION OF EPCAM POSITIVE PROGENITOR CELLS FROM HUMAN FETAL LIVER
Yock Young Dan1,2, Lidyana Amer2, Lin Lin Su3, Peng Cheang Wong3, Seng Gee Lin31,2; 1Gastroenterology and Hepatology, National University Hospital, Singapore, Singapore; 2Dept of Medicine, Yong Loo Lin School of Medicine, National University Singapore, Singapore, Singapore; 3Dept of Obstetrics and Gynecology, Yong Loo Lin School of Medicine, National University Singapore, Singapore, Singapore

Liver progenitor cells hold tremendous promise in their ability to provide a continual source of cells for wide variety of applications including cell therapy. Human liver progenitor cells are EPCAM positive but isolation and culture of these cells have proven difficult. We report the successful isolation and of EPCAM+ progenitor cells from the human fetal liver that can be expanded in in-vitro culture. Methods: 13 and 18 weeks human fetal liver obtained from abortion under the purview of ethics board approval were treated with standard collagenase digestion. Cells were then sorted using magnetic beads conjugated with anti-EPCAM antibody. Cultures were then performed on plates comparing various extracellular matrices including laminin, collagen, and matrigel, with and without feeder layers using chamber inserts. Cells were repeatedly passaged at confluence and purified with repeated EPCAM magnetic sorting.

Results: EPCAM positive cells were successfully isolated with up to 97% purity by immunofluorescence sampling. They demonstrated 3 distinct phenotype characterised by progenitor (CK19+, CD44+, alb-, AFP+), bipotential progenitors (albumin+/AFP+/CK19+) as well as a committed hepatoblast (albumin+/AFP+/CK19+). Laminin or matrigel coated plates together with conditioned media from EPCAM negative non-parenchymal cell fraction of the same liver were critical for maintaining progenitor phenotype. These cells retained high nuclear-cytoplasmic ratio, had a doubling time of 42 hours and could be expanded up to 6 passages in 3 months and were scaled up to 100 fold expansion in numbers. On differentiation protocols, colonies of hepatocyte-like cells that were strongly albumin and glycogen positive were observed. On collagen gels, tubular structures were obtained that were positive for GGT and CK7. Conclusion: EPCAM positive cells select for progenitor cells that are hepatoblast and biliary progenitors. These cells can be maintained in their progenitor status with high and robust proliferative and expansion potential. Manipulation of culture environment can augment differentiation into both hepatocytic and biliary lineages. Current strategy is aimed at isolating subfraction of these cells. The ability to expand progenitor cells in in-vitro cultures holds promise in providing an additional source for hepatocytes for its many potential applications.

190 SALL4 REGULATES DIFFERENTIATION AND PROLIFERATION IN HEPATIC STEM/PROGENITOR CELLS
Tsunekazu Oikawa1, Akihide Kamiya1, Sei Kakinuma1, Ryuchi Nishinakamura1, Hiromitsu Nakauchi1; 1Laboratory of Stem Cell Therapy, Center for Experimental Medicine, University of Tokyo, Tokyo, Japan; 2Division of Integrative Cell Biology, Institute of Molecular Embryology and Genetics, Kumamoto University, Kumamoto, Japan

Hepatic stem/progenitor cells are characterized by high proliferative capacity and bipotential differentiation into both hepatocytes and cholangiocytes. They are highly enriched in the fraction of CD45-Ter119-CD29+CD49f+c-kit- or Dlk+ cells derived from mid-fetal livers. Sall4 is a homologue of the Drosophila homeotic gene spalt and a zinc finger transcription factor required for the embryogenesis and proliferation of embryonic stem cells. We found that Sall4 expression was observed in the Dlk+CD45-Ter119- hepatic stem/progenitor cells from embryonic day 14 fetal liver but not adult hepatocytes. Sall4 expression was gradually decreasing during the development of liver, suggesting that Sall4 might be essential for development of fetal hepatic stem/progenitor cells rather than that of adult hepatocytes. Then, the role of Sall4 regulating fetal liver development is analyzed in this study. We constructed a retroviral vector expressing both Sall4 and enhanced green fluorescent protein using internal ribosomal entry site. We estimated proliferation of hepatic stem/progenitor cells using in vitro single colony assay system. Dlk+CD45-Ter119- hepatic stem/progenitor cells were isolated by FACS, infected with retrovirus expressing mock and Sall4 and cultured for 6 days in low cell density on collagen type I coated dishes. Infected cells were detected by the expression of green fluorescent protein. Colonies derived from hepatic stem/progenitor cells infected with Sall4-expressing retrovirus were clearly smaller than those derived from cells infected with control virus, suggesting that Sall4 inhibits the proliferation in hepatic stem/progenitor cells. We previously reported that hepatic stem/progenitor cells differentiated into mature hepatocytes using in vitro hepatic differentiation assay. Sorted Dlk+ hepatic stem/progenitor cells were infected with retrovirus expressing mock and Sall4 and cultured for 7 days in the presence of oncostatin M and extra-cellular matrices derived from Engelbreth-Holm-Swarm sarcoma. Morphologically, more undifferentiated hepatocytes were observed in the culture overexpressing Sall4. Moreover, the expression of tyrosine aminotransferase and tropohepin-2, 3-dioxogenase, hepatic maturation marker gene, was clearly down-regulated by the overexpression of Sall4. These results demonstrate that Sall4 suppresses maturation of hepatic stem/progenitor cells. Our results suggest that Sall4 may act as a negative regulator in hepatic stem/progenitor cell proliferation and play an essential role for hepatic cell fate determination.

191 MICRORNA ANALYSIS OF HEPATOCYTIC DIFFERENTIATION OF LIVER STEM CELLS REVEALS UP REGULATION OF MIR23B, 27B, 24 AND DOWN REGULATION OF SMAD3 AND SMAD5 TARGETS IN THE TGFB/β/BMP SIGNALLING PATHWAY
Leslie E. Rogler, Tatayana Tchaikovskaya, Laurenta LeVoci, Raquel Norel, Charles E. Rogler; Hepatology Division Medicine, Albert Einstein College of Medicine, Bronx, NY

MicroRNAs [miRNAs] are a class of endogenous noncoding RNAs of ~22 nucleotide in length, many of which are conserved from C. elegans to man. miRNAs control gene expression by translational inhibition and destabilization of mRNA, acting as molecular rheostats to control important cellular and developmental processes. In order to begin to understand the role of miRNAs in liver stem cell differentiation, we constructed a microRNA microarray consisting of probes for 372 different mouse and human microRNAs. The microRNA array was used to detect changes in miRNAs expressed during DMSO induced hepatocytic differentiation of HBC-3 murine hepatoblast cells.
The data were normalized to U6 expression and significant changes were identified using SAM analysis. Of the miRNAs 31 most highly expressed by HBC-3, 16 were up regulated, 9 were unchanged and 6 were down regulated during hepatic differentiation. The regulation of these genes was confirmed using Northern analysis. Among the miRNAs up regulated during differentiation were three miRNAs MiR-23b, 27b and 24-1, that are clustered on Chromosome 13 of the mouse within an intron of a RIKEN gene, RIKEN 20101101Rik. Bioinformatic analysis revealed two consecutive CAT and TATA box pairs within the sequence 5' of the miRNA cluster and a transcript containing all three miR in the cluster was amplified from HBC-3 cell total RNA using RTPCR indicating that these miRNAs are part of a polycistron. In addition, we were able to identify a putative promoter sequence containing binding sites for several liver enriched transcription factors including HNF1 and HNF4. We next compared lists of bioinformatically identified targets for miR23b, 27b and 24 with our cDNA microarray database to identify genes that were both down regulated and putative targets. Using this approach we found that Smad3 and Smad5 were putative targets of miR23b and were down regulated during hepatocytic differentiation. Further analysis using MicroInspector identified multiple target sites for the microRNAs within the 23b-24 cluster in the 3' UTR regions of both Smad3 and Smad5 including sites that were perfect seed matches and were conserved in mouse, rat, human, chimp and dog genomes. In Situ hybridization revealed that Smads 3 and 5 and miR23b are reciprocally expressed. Smads 3 and 5 expressed in the bile duct and miR23b in hepatocytes. This distribution pattern suggests that the function of miR23b may be to limit TGFβ BMP signaling with in the liver and the miRNAs in this cluster may play a role in cell fate determination in the liver.

192 PROSTAGLANDIN E2 MODULATES WNT-MEDIATED CONTROL OF LIVER DEVELOPMENT AND REGENERATION IN ZEBRAFISH
Wolfram Goessling1,2, Trista E. North3, Allegra M. Lord3, Sang Lee3, Mark Puder3, Randall T. Moon3, Leonard I. Zon4. Gastrointestinal Unit, Massachusetts General Hospital, Boston, MA; 2Stem Cell Program, HHMI, Children's Hospital, Boston, MA; 3Department of Surgery, Children's Hospital, Boston, MA; 4Department of Pharmacology, HHMI, University of Washington, Seattle, WA

wnt signaling is frequently altered in liver cancers. Recently, we and others described the role of wnt in vertebrate liver development. Using zebrafish, we demonstrated that after endodermal specification, wnt signaling is required for liver growth. In addition, we found that activated wnt signaling, such as in APC+/- embryos, markedly enhanced liver size. Wnt activation also significantly accelerated liver regeneration following partial hepatectomy in both zebrafish and mice. APC+/- zebrafish have increased propensity to develop spontaneous liver tumors, which resemble hepatoblastomas found in humans carrying APC mutations. These data illustrate the central role of wnt signaling in regulating hepatogenesis and in maintaining liver homeostasis in vertebrates. As patients with APC mutations are treated with cyclooxygenase (cox) inhibitors for chemoprevention of colonic polyps, we investigated whether alterations in prostaglandin (PG) signaling could modulate wnt activity in the liver. Using TOP:GFP, wnt reporter zebrafish, we found that PGE2 stimulated wnt signaling in vivo during development; this difference was significant by qPCR. Conversely, the cox inhibitors indomethacin or NS-398 (cox2) significantly decreased wnt activity. By in situ hybridization and confocal microscopy of fluorescent transgenic liver reporter fish, we analyzed the effects of PG modulation on liver development. PGE2 increased liver size and total hepatocyte number compared to controls; this result was confirmed by FACS analysis of individual embryos. Treatment with indomethacin or NS-398 mitigated the effects of wnt activation in APC+/- embryos; histological analysis revealed decreased levels of β-catenin and BrdU incorporation, indicating the inhibition of wnt-mediated cellular proliferation. In adult fish, PGE2 treatment following partial hepatectomy enhanced liver regeneration, as shown in vivo by ultrasound microscopy. Furthermore, indomethacin treatment diminished liver regeneration in APC+/- adults. Induction of the wnt antagonist dickkopf (dkk) or a dominant negative form of the β-catenin nuclear binding cofactor TCF (dnTCF) are detrimental to both liver development and regeneration. PGE2 rescued the effect of dkk induction, but not of dnTCF, suggesting that the interaction of PGE2 with the wnt signaling pathway in vivo occurs in the cytosol, possibly at the level of the destruction complex. The role of PGE2 in modulating wnt activity during liver regeneration was conserved in mice. This work provides in vivo evidence for the validity of pharmacological regulation of PG activity in the treatment of wnt-mediated liver disease and regeneration.

193 TUMOR NECROSIS FACTOR RECEPTOR 1 AND 2 DEFICIENCY OR ACIDIC SPHINGOMYELINASE ABLATION AMELIORATES ETHANOL-INDUCED LIVER DAMAGE
Anna Fernandez, Anna Colell, Francisco Caballero, Carmen Garcia-Ruiz, Jose C. Fernandez-Checa; Liver Unit, Hospital Clinic, Barcelona, Spain

Tumor necrosis factor (TNF) is a proinflammatory cytokine that induces different cellular responses including inflammation, proliferation and cell death. TNF binds to two different plasma membrane receptors, TNF receptor 1 (TNFR1) and receptor 2 (TNFR2). Evidence from studies using anti-TNF therapy and TNFR1 knockout mice indicated an important role for TNF in the pathogenesis of alcoholic liver disease (ALD). Recent studies in experimental models of alcoholic (ASH) and non-alcoholic steatohepatitis (NASH) questioned the role of TNFR1 in disease progression and hepatic steatosis. Moreover, acidic sphingomyelinase (ASMA) has been shown to play a key role in the hepatocellular death induced by TNF. However, since in the absence of TNFR1 TNF can signal through TNFR2, and because the role of the ablation of both TNFR1 and TNFR2 or ASMA in ALD have not been previously examined, the aim of this study was to examine the contribution of TNFR1/TNFR2 and ASMA in ALD. Methods: 8-weeks-old male C57BL/6 mice deficient in both TNFR1 and TNFR2 (DKO) and ASMase in ALD. Methods: 8 weeks-old male C57BL/6 mice deficient in both TNFR1 and TNFR2 (DKO) and ASMA-/- mice were used. Animals were fed the Lieber-DeCarli diet for up to 4-6 weeks. Animals received a single dose of LPS (5mg/kg) 24 hours before sacrifice. Liver damage was assessed by histochemical hematoxilin/eosin staining and serum transaminase levels. Hepatic steatosis and lipid infiltration were examined by oil red staining and biochemical analysis. Hepatic inflammation was monitored by myeloperoxidase (MPO) staining. Results: the hepatic inflammation and necrosis observed in wild type ethanol-fed mice were attenuated significantly in DKO knockout mice. In vivo LPS injection in ethanol wild animals increased AST serum levels 8 times over pair-fed control mice (1440±210 U/dl vs. 135±14 U/dl) respectively.
This increase was significantly lower in mice lacking both TNF receptors (ethanol DKO +LPS vs. ethanol wild type + LPS: 235±45 U/dL vs. 1320±157U/dL). The increase in hepatic triglycerides, cholesterol and free fatty acids induced by ethanol feeding was also reduced (72±9, 68±11, 59±8%, respectively) in the DKO mice fed ethanol. Moreover, inflammatory cell foci reflected by MPO staining showed a marked reduction in DKO-fed ethanol mice vs wild-type ethanol fed mice following in vivo LPS challenge. The findings with ASMase knockout ethanol-fed mice paralleled those observed with DKO in terms of reduced steatosis, hepatocellular injury and inflammation. Conclusion: These results support the hypothesis that TNF-alpha plays an important role in alcohol-induced liver injury and that the targeting of TNF or its downstream mediator ASMase may be therapeutically useful in this disease.

195 ETHANOL-INDUCED HISTONE ACETYLATION: A NOVEL MECHANISM FOR ENHANCEMENT OF INFLAMMATION IN ALCOHOLIC HEPATITIS?
Stuart Kendrick, Graeme O'Boyle, Jelena Mann, David E. Jones, Christopher P. Day; Institute of Cellular Medicine, Newcastle University, Newcastle upon Tyne, United Kingdom

Studies in patients and models of acute alcoholic hepatitis (AAH) demonstrate increased release of inflammatory cytokines from Kupffer cells or monocytes in response to bacterial endotoxin (LPS) acting via toll-like receptor 4 (TLR4) after ethanol treatment. This has been described as failure of the normal adaptive mechanism of endotoxin tolerance. Ethanol also increases histone acetylation in the liver. Histone acetylation at gene promoter regions changes chromatin conformation and facilitates transcription. We hypothesised that ethanol enhances cytokine production by increasing histone acetylation of pro-inflammatory genes.

Methods: The human monocyte cell line MonoMac6 was grown in RPMI-1640 medium with and without 0.5% ethanol for 0-6 days. Surface TLR4 was measured by FACS. Cytokine output was stimulated by E. coli LPS 10ng/ml and quantified by multiplex electrochemiluminescent immunoassay and quantitative RT-PCR. Histone modifications were visualised by immunofluorescence and elucidated by acid-urea gel electrophoresis. Promoter-specific changes in histone acetylation were determined by chromatin immunoprecipitation. MntBAP, 4-methylpyrazole and cyanamide were used to clarify the contribution of oxidative stress and ethanol metabolism to the effect.

Results: We observed significant augmentation of IL6 (5160 v 1192pg/ml at 48h p=0.05, Mann-Whitney U test) and IL-10 (1141 v 617pg/ml p=0.05) release in response to LPS in ethanol compared to normal medium. This was accompanied by a significant increase in surface TLR4 in ethanol. Increases in IL-8 (15160 v 14310pg/ml p=0.2) and TNFα (122 v 112pg/ml p=0.05) were more modest, suggesting a differential effect of ethanol on cytokine production by mechanisms not purely dependent on TLR4 number. We tested for failure of endotoxin tolerance but observed that tolerance was maintained - the cytokine response to a second LPS stimulus was strongly suppressed both with and without ethanol. Intriguingly, suppression of the anti-inflammatory IL-10 was more profound with ethanol than without (459 v 667pg/ml p=0.05) which may favour inflammation despite reduction in total cytokine output. We went on to analyse changes in histone modification and observed increased acetylation of histones H3 and H4 in ethanol-exposed cells, mirroring the cytokine observations.

Conclusions: The previously-unreported association between ethanol, histone acetylation and cytokine gene expression reveals a potential component of the mechanism of AAH. This raises the possibility of a novel use for drugs known to modulate histone acetylation, such as theophyllines, an established and safe therapy that remains completely untried in AAH.

ZEBRAFISH EMBRYOS DEVELOP SIGNS OF LIVER DISEASE FOLLOWING SHORT-TERM EXPOSURE TO ALCOHOL

Michael Passeri, Ayca Cinaroglu, Kirsten C. Sadler; Division of Liver Diseases and Molecular Cell and Dev. Biology, Mt. Sinai School of Medicine, New York, NY

Background. Alcoholic liver disease (ALD) is the leading cause of liver cirrhosis in the US and can lead to both acute and chronic hepatitis. In addition, alcohol abuse commonly results in a reversible accumulation of fat in the liver (steatosis), which can progress to irreversible inflammation (steatohepatitis) if drinking continues. Binge drinking, the introduction of a large quantity of alcohol over a short period of time, can also result in a number of ALD symptoms, including steatosis. Many of the molecular mechanisms behind the onset and progression of ALD symptoms remain unclear, in particular, while there is a clear genetic basis to ALD, little is known about the genetic contributions to this disease, and for such studies, a genetically tractable animal model is sought. Zebrafish are renowned for their utility to uncover the genetic basis of embryonic development, and some work using this system as a model to study the effects of alcohol on development have been reported. This system provides the opportunity to carry out alcohol studies on a large scale and, importantly, to address the genes that contribute to ALD onset. Aim. We have developed a delivery system to demonstrate the effects of acute ethanol (EtOH) treatment on a naive, but developed and functional liver in zebrafish embryos. Approach and Results. Exposing day 4 embryos to EtOH concentrations exceeding 3% results in rapid mortality, however, sub-lethal concentrations (2-3% EtOH) for 32 hours resulted in developmental abnormalities, including pericardial edema and malformed musculature, as well as altered swimming behavior. Tissue alcohol measurements indicate that fish treated with 2% EtOH for 32 hours have ~35 mM intracellular EtOH. Importantly, over 50% of embryos that were treated with 2% EtOH for 32 hours (from days 4-5 of development) demonstrate several signs of alcohol mediated liver damage including hepatomegaly and steatosis, as determined by oil red O staining and histological analysis. To determine whether changes in gene expression in accordance with ALD were detected, embryos treated with 1-2% EtOH were analyzed by quantitative real-time PCR. We detected signs of oxidative stress, as indicated by the induction of thioredoxin and cytchrome p450 2e1 (cyp2e1) genes, and endoplasmic reticulum stress as determined by increased bip, chop, gadd45, and atf3 expression. Conclusions. Morphological and molecular data support the idea that EtOH treated zebrafish embryos develop signs ALD, and therefore present a prime candidate for future studies to investigate the genetic factors which contribute to this disease.

PKCε PLAYS A CAUSAL ROLE IN ETHANOL-INDUCED STEATOSIS

J. Phillip Kaiser1, Claudia von Montfort1, Juliane I. Beier1, Luping Guo1, Yuting Zheng2, Aruni Bhatnagar1,2, Gavin E. Arteel1,2; 1Pharmacology and Toxicology, University of Louisville, Louisville, KY; 2Division of Cardiology, University of Louisville, Louisville, KY; 3James Graham Brown-Cancer Center, University of Louisville, Louisville, KY

Insulin resistance is a known independent risk factor for alcoholic liver disease. Whereas ethanol metabolism has been shown to cause hepatic steatosis, recent studies have suggested that insulin resistance exacerbates fat accumulation caused by ethanol. PKCε has been shown to cause hepatic insulin resistance and steatosis in experimental (NAFLD); however, the role of PKCε in ethanol-induced steatosis has not been determined. The purpose of this study was to therefore test the hypothesis that PKCε contributes to ethanol-induced steatosis. Accordingly, the effect of acute ethanol on indices of hepatic steatosis and insulin signaling were determined in wild-type and PKCε-/- mice. Acute ethanol (6 g/kg i.g.) caused a robust increase in hepatic non-esterified free fatty acids (NEFAs), which peaked peaked (5-fold) 1 h after ethanol exposure; a concomitant activation of PKCε was observed under these conditions. Acute ethanol also changed the pattern of expression of insulin-responsive genes (e.g., glucose-6-phosphatase; G6Pase), indicative of impaired insulin signaling. Lastly, acute ethanol exposure caused a >20-fold increase in hepatic triglycerides, peaking 12 hrs after ethanol administration. The alteration in G6Pase and later triglyceride accumulation caused by ethanol was blunted in PKCε-/- mice. In contrast, the increase in NEFAs caused by ethanol was not attenuated in PKCε-/- mice. Taken together, these data suggest that the increase in NEFAs caused by hepatic ethanol metabolism activates PKCε, which then exacerbates hepatic lipid accumulation by inducing insulin resistance. These data also suggest that PKCε plays a causal role in at least the early phases of ethanol-induced liver injury. [supported by NIAAA].

Disclosures: The following people have nothing to disclose: J. Phillip Kaiser, Claudia von Montfort, Juliane I. Beier, Luping Guo, Yuting Zheng, Aruni Bhatnagar, Gavin E. Arteel
and fibrosis were not seen. LCFA Uptake Kinetics: The hepatocellular LCFA uptake Vmax was increased vs control (1.1±0.07 pmol/sec/50,000 cells) in dose dependent fashion in the 10, 14, and 18% EtOH-fed groups (2.3±0.1, 2.8±0.2, and 3.1±0.4 pmol/sec/50,000 cells, respectively; p<0.001). While none of the EtOH-fed groups gained weight, epididymal fat pad weights increased, suggesting loss of muscle mass, and, although neither glucose nor LCFA levels were elevated, adipocyte LCFA uptake Vmax increased ~1.8-fold (p<0.05). Cardiac Histology: Control hearts showed occasional ORO+ droplets within cardiomyocytes. EtOH produced a dose-dependent increase in intra-cardiomyocyte lipid droplets that was striking in the 18% EtOH group. Conclusions: EtOH produces significant, dose dependent changes in LCFA disposition in liver, fat, and myocardium. Observed changes in adipocyte LCFA disposition may result in an increased LCFA load to the liver, contributing to HS, and increased cardiac TG accumulation, reflecting increased LCFA uptake, may contribute to alcoholic cardiomyopathy as it does in other settings. Simple mouse models of EtOH consumption can elucidate human pathophysiology and disease.

199 CONTRIBUTION OF THE SYMPATHETIC HORMONE EPINEPHRINE TO THE SENSITIZING EFFECT OF ETHANOL ON LIPOPOLYSACCHARIDE-INDUCED LIVER DAMAGE
Claudia von Montfort1, Juliane I. Beier1, Luping Guo1, Gavin E. Arteel1,2; 1Pharmacology & Toxicology, University of Louisville, Louisville, KY; 2James Graham Brown Cancer Center, University of Louisville, Louisville, KY

It is well-known that ethanol pre-exposure sensitizes the liver to LPS hepatotoxicity. The mechanisms of this effect of ethanol on liver injury owing to LPS are not completely elucidated, but are known to involve an enhanced inflammatory response. It has been shown that the metabolic effect of ethanol on liver is mediated at least in part, by the sympathetic hormone, epinephrine. However, whether or not the sympathetic nervous system also contributes to the sensitizing effect of ethanol preexposure on LPS-induced liver damage has not been determined. The purpose of this study was therefore to test the hypotheses that (i) epinephrine preexposure enhances LPS induced liver damage (comparable to that of ethanol preexposure) and that (ii) the sympathetic nervous system contributes to the sensitizing effect of ethanol. Accordingly, male C57BL/6j mice were administered epinephrine for 3 days (2mg/kg/d) via osmotic pumps or bolus ethanol for 3 days (6 g/kg/d) by gavage. Twenty-four h later, mice were injected with LPS (10 mg/kg i.p.). Both epinephrine and ethanol preexposure exacerbated LPS-induced liver damage and inflammation. Concomitant administration of propranolol with ethanol (3x or 1x with the last dose of ethanol), significantly attenuated the sensitizing effect of ethanol on LPS-induced liver damage. These data support the hypothesis that the sympathetic nervous system contributes, at least in part, to the mechanism of the sensitizing effect of ethanol. These results also suggest that sympathetic tone may contribute to the initiation and progression of alcoholic liver disease. (Supported, in part, by NIAAA).

200 ENHANCEMENT OF FIBRIN DEPOSITION CONTRIBUTES TO THE SYNERGISTIC EFFECT OF ETHANOL ON LPS-INDUCED LIVER INJURY
Juliane I. Beier1, Luping Guo1, James P. Luyendyk2, Claudia von Montfort1, Gavin E. Arteel1,2; 1Pharmacology and Toxicology, University of Louisville Health Science Center, Louisville, KY; 2Pharmacology, Toxicology & Therapeutics, The University of Kansas, Kansas City, KS; 3James Graham Brown Cancer Center, University of Louisville, Louisville, KY

It is well-known that ethanol enhances liver injury caused by bacterial lipopolysaccharide (LPS). Work by others has shown that LPS-induced liver injury involves, at least in part, activation of the coagulation cascade (e.g., factor X) leading to fibrin deposition. Recent work by this group has shown that ethanol induces activation of plasminogen activator inhibitor-1 (PAI-1), which may cause fibrin accumulation, but by inhibiting degradation of fibrin (fibrinolysis) and not by enhancing deposition via the coagulation cascade. Given that LPS and ethanol both potentially cause fibrin accumulation, but via different mechanisms, it was hypothesized here that fibrin accumulation contributes to the synergistic effect of ethanol on LPS-induced liver damage. Accordingly, the effect of ethanol pretreatment on LPS-induced liver injury and fibrin deposition was determined in mice. Ethanol pretreatment significantly enhanced liver damage caused by LPS, as determined by plasma parameters (AST and ALT) and histologic indices of inflammation and damage. This enhancement of liver damage was concomitant with a significant increase in the induction of plasminogen activator-1. The extracellular deposition of fibrin caused by LPS was also robustly increased by ethanol preexposure. Co-administration of agents that inhibited thrombin (heparin and hirudin) significantly attenuated the enhanced liver damage caused by ethanol preexposure; this protective correlated with a significant blunting of the induction of PAI-1 caused by ethanol/LPS. Furthermore, thrombin inhibition prevented the synergistic effect of ethanol on the extracellular accumulation of fibrin caused by LPS. Taken together, these results suggest that enhanced LPS-induced liver injury caused by ethanol is mediated, at least in part, by the synergistic activation of extracellular fibrin deposition (by LPS) and concomitant inhibition of fibrinolysis (by ethanol) and supports the hypothesis that fibrin accumulation and subsequent hemostasis may play a critical role in the development of alcohol-induced liver injury. 201 PROSPECTIVE SCREENING OF INFECTION IN PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS TREATED WITH STERODS: EARLY RESPONSE TO THERAPY IS THE KEY FACTOR
Alexandre Louvet1,2, Sébastien Dharrancy1,2, Jeanne Boitard1, Faustine Wartel1, Valérie Canva1, Pierre Deltenre1, Philippe Mathioudakis1,2; 1Hepatology, Hôpital Huriez, Lille, France; 2INSERM U 795, Lille, France

Despite the efficacy of steroids in severe alcoholic hepatitis (SAH) (Maddrey≥32), concerns are still raised with regard to the risk of infection. Aim: using a systematic screening, we prospectively determined the incidence of infection in all patients admitted for SAH before (pre-steroids), during and 2 months after the initiation of steroids (post-steroids). Methods: At admission the systematic screening of infection consisted in...
chest X-ray, blood, ascites and urinary cultures. C reactive protein was monitored weekly. The same screening was performed in the case of any suspicion of infection. All patients were treated with prednisolone 40mg daily during 28 days. Response to steroids was early defined at 7 days using the Lille model [Hepatology May 2007]. Results: At baseline, characteristics of the 189 patients were: age 50.9±0.6 years, ascites 73%, encephalopathy 26%, INR 2.1±0.04, serum bilirubin 183±8 mg/l, MELD 27±0.4, Maddrey 68±2, albumin 26±0.3 g/l, creatinine 12.4±0.9 mg/l, AST 189±22 IU/l. Pre-steroids/47 infections were diagnosed before steroids: 21 (44.7%) spontaneous bacterial peritonitis (SBP), 4 (8.5%) pulmonary (PI), 16 (34%) urinary (UI) and 6 (13%) others (OI). All infected patients were treated by antibiotics. 2 died before steroids initiation. Steroids were initiated 7 days (95%CI: 5-8) after the onset of infection. Patients infected before steroids had similar 2-month survival than others: 68±7% vs 72±4%. Post-steroids/47 infections were diagnosed after steroids: 41 patients developed an infection at a median delay of 14 days (95%CI: 9-24): 12 (29.3%) SBP, 15 (35.6%) PI, 8 (19.5%) UI and 6 (14.5%) OI. Infection occurred more frequently in non-responders than in responders: 9% vs 43%, p<0.000001. In univariate analysis, only the MELD (p=0.005) and the Lille model (p=0.0005) were associated with the probability of being infected. In multivariate analysis, only the Lille model (p=0.0001) independently predicted the probability of being infected whereas MELD not (p=0.13). In survival analysis, 6 variables reached a univariate p value ≤ 0.1: encephalopathy (p=0.0001), ascites (p=0.07). MELD (p=0.000001), Lille model (p=0.000001), AST (p=0.02), and infection (p=0.0004). In multivariate analysis, only the Lille model (p=0.000001) was independently associated with survival whereas the others including MELD (p=0.2) and infection (p=0.5) were not. Conclusion: SAH is associated with a high risk of infection. Infection screening is warranted at the admission but should not contraindicate steroids. In term of mechanisms, non-response to steroids is the key factor explaining the development of infection and is the only independent prognostic factor.

Disclosures: The following people have nothing to disclose: Alexandre Louvet, Sébastien Dharancy, Jeanne Boitard, Faustine Wartel, Valérie Canva, Pierre Deltenre, Philippe Mathurin

203 EFFECT OF CHRONIC ALCOHOL CONSUMPTION ON NUCLEAR GENE REGULATORS OF MITOCHONDRIAL FUNCTION
Charles S. Lieber1,2, Maria A. Leo1,2, Xiaolei Wang2, Anatoly Ponomarenko1, Leonore M. DeCarli1; 1Research, James J. Peters VA Medical Center, Bronx, NY; 2Mount Sinai School of Medicine, New York, NY

We have shown that chronic alcohol consumption affects the liver through mitochondrial damage and redox state alteration. Recently, it was found that a NAD dependent deacetylase Sir1 (SIRT1) regulates the activity of the peroxisome proliferator-activated receptor-γ coactivator 1α (PGC-1α), a key regulator of glucose production and energy metabolism, suggesting that these nuclear factors participate in the regulation of mitochondrial biogenesis, while interacting also with the nuclear receptor peroxisome proliferator-activated receptor-γ (PPARγ). The aim of this study was to investigate the role of chronic alcohol consumption on the expression of these proteins in the presence of alcohol-induced liver injury. Accordingly, rats were pair-fed the standard dextrin-maltose or the alcohol-containing Lieber-DeCarli liquid diets for 21 to 28 days. Alcohol significantly increased CYP2E1 mRNA (p=0.0002) and induced microsomal and mitochondrial proteins (p<0.001) with associated mitochondrial lipid peroxidation (p<0.001) and TNF-α mRNA increase (p=0.022). The mRNA expression of SIRT1, PGC-1α and PPARγ genes were assessed by RTPCR in liver lysate. The mRNA and the protein expressions of the transcription factor on age, gender, creatinine, PT and bilirubin selected without knowledge of their survival. Results: 38 patients were included in this study: 19 treated with MARS and 19 paired non-responders. At baseline, there was no significant difference between MARS and control groups for male gender (68.4 vs 68.4%), age (50.8±1.8 vs 51.1±1.4years), percentage of encephalopathy (45.6 vs 44.8%), AST (329±185IU/l vs 149±18IU/l), bilirubin (213±25 vs 192±22mg/l), creatinine (10.4±2 vs 12.5±2mg/l), albumin (26±1.7 vs 26±1.5g/l), PT (26.7±1.6 vs 25±2s), Maddrey function (84±5 vs 80±9) and Lille model (0.73±0.08 vs 0.78±0.06). As planned, the median number of MARS sessions was 3 (95%CI: 2-3, range 1-3). Fibrinogen before MARS was 1.5±0.2 g/l. In terms of safety, fibrinolysis occurred in 6 out of the first 8 patients treated with MARS. In the following 11 patients, during each session, we systematically administered 10mg/kg/hr Exacyl® (tranexamic acid). The decrease of fibrinogen after the first session was drastically lower in the patients treated with Exacyl®: 16±3% vs -76±12%, p<0.001) and coagulation disorders were no longer observed (75 vs 0 %, p=0.0005). On overall patients, each session of MARS induced a significant relative decrease in bilirubin (-18±4%, -6±4%, -15±5%) and creatinine (-20±6%, -13.5±7%, -5±9%) whereas it worsened PT (+19±6%, +11±4%, +16±6%). Patients treated with MARS had similar 1 and 2-month survival than their matched controls: 52.6±11 vs 52.6±11% and 42.1±11 vs 31.5±10.7%. In a sensitivity analysis restricted on patients treated with Exacyl®, there is still no difference in 2-month survival between the MARS patients and controls (46±15 vs 32±11, p=0.25). Conclusion: In the particular subgroup of non responders to steroids characterized by severe liver failure, MARS seems not to be efficient. In terms of safety, administration of Exacyl® is essential to prevent fibrinolysis.

Disclosures: The following people have nothing to disclose: Jeanne Boitard, Alexandre Louvet, Benjamin Bismuth, Sébastien Dharancy, Faustine Wartel, Valérie Canva, Pierre Deltenre, Brigitte Jude, François Fourrier, Philippe Mathurin
PPARγ were not affected by alcohol, whereas alcohol significantly reduced hepatic SIRT1 mRNA by 50% (p<0.01) and PGC-1α mRNA by 46% (p<0.01) and it significantly inhibited the protein expression of SIRT1 and PGC-1α (p<0.01) assessed by Western blot and corrected by β-actin as a loading control. In a preliminary attempt to offset these changes, additional groups of rats were fed the alcohol diet in which long-chain triglycerides (LCT) were replaced by medium-chain triglycerides (MCT). After 21 days feeding, MCT significantly restored SIRT1 and PGC-1α mRNA up to control levels (p<0.001 and p<0.01 compared to alcohol respectively), but had no effect on the respective protein expression. Conclusion: 1) for an equivalent dietary intake, chronic alcohol consumption reduces key energy sensing proteins (SIRT1 and PGC-1α) and their mRNAs expression through alterations of the redox state and mitochondrial dysfunction; 2) In the presence of alcohol consumption replacement of LCT by MCT affects transcription of these genes by restoring the mRNA levels to near control values, however MCT was not effective at the translation level since it did not increase the protein expressions after this short period of alcohol consumption. Since there is a pathophysiological link between SIRT1 and PGC-1α and mitochondrial energy the implication of the study is that mitochondrial dysfunction due to alcohol abuse can be treated by dietary modifications. ALBUMIN AND OTHER ENDOTOxin REMOVAL METH-OIDS RESTORE NEUTROPHIL FUNCTION EX VIVO IN PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS

Vanessa Stadlbauer, Rajeshwar P. Mookerjee, Gavin A. Wright, Nathan A. Davies, Stephen Hodges, Rajiv Jalan; University College London, London, United Kingdom

Background and Aims: Albumin infusion in patients with spontaneous bacterial peritonitis prevents progression to renal failure. In patients with severe alcoholic hepatitis (AH) ‘immune failure’ contributes to organ failure and mortality. We previously demonstrated that a resting burst of >55% and phagocytosis of <42% was associated with infection risk and mortality. This functional defect in neutrophils could be reproduced by incubating normal neutrophils with endotoxin. This study aimed to test the hypothesis that endotoxin may be responsible for the observed neutrophil dysfunction and that albumin may restore neutrophil function ex vivo. Methods: Isolated peripheral blood neutrophils from healthy volunteers were incubated with plasma from non-infected patients with a resting oxidative burst over 55% or with a resting oxidative burst below 55%. Neutrophil oxidative burst and phagocytosis was assayed by FACs analysis (Phagoburst and Phagotest, Orpegen). Endotoxin was measured using a LAL assay (Charles River). Endotoxin was removed either by passing the plasma over a polymyxin B containing column (Detoxi-Gel, Pierce Biotechnology), incubation with an LPS-neutralizing anti-CD14 antibody (Clone 11D18, Immunotools) or incubating with human albumin (BPL). Results: Patients with high resting oxidative burst had elevated endotoxin levels (0.12±0.04 EU/ml versus 0.01±0.01 EU/ml in controls). When plasma was passed over Detoxi-Gel columns, resting burst was reduced by 32% (p<0.001, n=9) and phagocytosis increased by 31% (p<0.05, n=11), whilst having no effect on neutrophils incubated with low burst (n=8) or healthy control plasma (n=3). Incubation with an anti-CD14 antibody prevented the induction of increased burst in normal neutrophils by high burst patients plasma (p<0.001, n=7) and increased phagocytosis by 20% (p<0.05, n=11), whilst having no effect on neutrophils incubated with low burst (n=8) or healthy control plasma (n=3). Incubation with increasing concentrations of human albumin (10g/L, 20g/L, 40g/L, n=10) caused a dose dependent decrease in resting oxidative burst (19%, 23%, 35%) and an increase in phagocytic capacity (25%, 41%, 41%). Conclusions: Our data indicate that patients with severe AH have endotoxemia and that ex vivo removal/binding of endotoxin or incubation with albumin restores neutrophil function. Albumin and other in vivo and/or ex vivo strategies for endotoxin removal warrant further evaluation in severe AH.

DIAGNOSTIC ACCURACY OF CARBOHYDRATE DEFICIENT TRANSFERRIN IN PATIENTS WITH CHRONIC LIVER DISEASE. ALCOHOL CONSUMPTION AND LIVER DISEASE SEVERITY EFFECTS

Armand Abergel1, Corinne Bonny1, Karine Randl1, Carine Nicolas1, Sylvie Massoulier1, Bernadette Cruz1, Brigitte Chanteranne1, Laurence Roszyk2, Pierre Jouanel2, Gilles Bommelaer1, Vincent Sapin2; 1Hepato-gastroenterology, CHRU Clermont-Ferrand, Clermont-Ferrand, France; 2Biochemistry, CHRU Clermont-Ferrand, Clermont-Ferrand, France

There are few studies on alcohol screening in a large cohort of patients with chronic liver diseases. G-Glutamyl Transpeptidase (GGT) has a low specificity and Mean Corpuscular Volum (MCV) a low sensitivity. Carbohydrate Deficient Transferrin (CDT) is measured in most clinical laboratories by the BioRad® CDT TIA kit but its specificity is low. Capillary electrophoresis (CE) and HPLC are the 2 confirmatory technics (Helander, Clin Chem 2005). Our aims were to study: 1) diagnostic accuracy of CDT measured by CE (N<1.3%) in 414 patients (HCV=287, HBV=41, Alcohol=19, Others=67), 2) the effect of fibrosis stage on CDT values. We divided the cohort in 2 subgroups of 207 patients by randomisation. The patients were matched by age and gender. Group 1 was the experimental group and Group 2 the validation group. To study the effect of fibrosis on CDT, only HCV patients evaluated with Fibrotest were included. In Group 1 patients, mean age was 53 years and sex ratio 1.3. 15%, 8% and 7% have consumed respectively more than 10g, 20 g of alcohol/day or were heavy drinkers according to the WHO definition. 9% of young men (<50 years) were heavy drinkers. CDT was higher in men than in women but the difference was not statistically different after stratification for alcohol use. CDT was correlated to alcohol ingested in g/day in the last month but was not correlated to transferrin saturation, ferritin, BMI, Metavir grade or stage. CDT, GGT and MCV sensitivity to diagnose heavy drinking was respectively 38%, 94% and 50%. Sp was respectively 96%, 43% and 82%, PPV was respectively 35%, 9% and 15%. Positive likelihood ratio (LR+) was 9.5 for CDT, LR- was 0.7 and Diagnostic Odds ratio (LR+/LR-) 14.6. In patients with chronic hepatitis C (CHC) from Group 1, mean CDT decreased significantly when the fibrosis score (Fibrotest) increased (<0.32 (F0-F1), 0.32-0.58 (F2), >0.58 (F3-F4)). CDT decreased from 0.76 to 0.59 and 0.55 according to the 3 thresholds (p=0.0125, ANOVA test). The same trend was found in Group 2 (p=0.025). In conclusion, CDT decreases with liver disease severity, has an excellent specificity, the best PPV but a diagnostic odds ratio < 30. CDT specificity has clearly increased as compared with the results obtained by other groups with the BioRad® CDT test but
sensitivity and VPP are still low. Young men with liver disease should be frequently screened for alcohol consumption. AUDIT questionnaire should be tested in patients with a liver disease to improve sensitivity.

206 PLASMA FROM PATIENTS WITH SEVERE ALCOHOLIC HEPATITIS INDUCES A FUNCTIONAL DEFECT POSSIBLY THROUGH EXPRESSION OF TOLL-LIKE-RECEPTORS 2 AND 9 BUT NOT 4
Vanessa Stadlbauer, Rajeshwar P. Mookerjee, Gavin A. Wright, Stephen Hodges, Nathan A. Davies, Rajiv Jalan; University College London, London, United Kingdom

In patients with alcoholic hepatitis, organ failure and mortality are often related to infection. Our previous studies have shown that endotoxemia may be related to neutrophil dysfunction and its removal restores neutrophil function but the mechanism of this is unclear. Toll-like receptors (TLR) are responsible for pathogen recognition and play a key role in early inflammatory response. We aimed to investigate the effect of patients plasma on TLR 2, 4 and 9 expression and whether albumin, which prevents induction of neutrophil dysfunction ex vivo, modulates the TLR 2, 4 and 9 expression. Neutrophils were isolated from whole blood of healthy volunteers and incubated with plasma from patients with alcoholic hepatitis (n=10) with or without the addition of human albumin (40 g/L). TLR 2, 4 and 9 expression was analysed by FACS analysis. Incubation of normal neutrophils with patients plasma induced a 71% increase in TLR2 expression and a 174% increase in TLR9 expression (p<0.0001) whereas TLR4 expression was unchanged. Incubation with 40 g/L human albumin reduced TLR2 and 9 expression to values not different from control and did not change TLR4 levels. (Figure 1) Plasma from patients with alcoholic hepatitis increases expression of TLR2 and 9 in normal neutrophils, likely due to the presence of bacterial products. TLR4 surface expression is not altered, which might indicate that TLR4 (the main receptor responding to endotoxin), is constitutively present in neutrophils to ensure immediate response to any endotoxin challenge. The beneficial effect of albumin in preventing the patient plasma induced neutrophil dysfunction together with a reduction in expression of TLR2 and 9 might define the mechanism through which albumin reduces inflammatory response and improves clinical outcome.

Expression of TLR 2, 4 and 9 on neutrophils incubated with plasma from alcoholic hepatitis patients with or without added albumin. PP: patients plasma, *** p<0.001

207 NUTRITIONAL AND METABOLIC SIMILARITIES BETWEEN ALCOHOLIC AND NON-ALCOHOLIC STEATOHEPATITIS: A GENERAL POPULATION ASSESSMENT
Steven L. Condron1, Matthew J. Gurka2, Abdullah M. Al-Osaimi1, Stephen H. Caldwell1, Patrick G. Nordrup1, 1Gastroenterology and Hepatology, University of Virginia Health System, Charlottesville, VA; 2Public Health Sciences, University of Virginia Health System, Charlottesville, VA

Objectives: Despite very similar histopathologic appearances, alcoholic liver disease (ALD) and non-alcoholic fatty liver disease (NAFLD) have presumably different etiologies reflected in their respective names. This study was designed to determine what metabolic and nutritional factors, aside from alcohol consumption, might predispose to steatohepatitis of either etiology in the general population of the US. Methods: The National Health and Nutritional Evaluation Survey (NHANES) conducted from 1999-2002 was analyzed to compare alcoholic liver disease (ALD) to non-alcoholic fatty liver disease (NAFLD) patients. All non-pregnant, adult subjects with negative viral serologies for hepatitis B and C with an elevated serum alanine aminotransferase (ALT) level were included in the analysis. Population-adjusted multivariate regression models were developed to compare metabolic and nutritional characteristics between the populations of ALD and NAFLD. Results: Of 6,653 participants, 293 (4.4%) subjects had elevated ALT values and endorsed excessive alcohol consumption (ALD group). 479 (7.2%) subjects had elevated ALT values without a definite alternative etiology and endorsed minimal alcohol consumption (NAFLD group). All non-pregnant, adult subjects with negative viral serologies for hepatitis B and C with an elevated serum alanine aminotransferase (ALT) level were included in the analysis. Population-adjusted multivariate regression models were developed to compare metabolic and nutritional characteristics between the populations of ALD and NAFLD. Results: Of 6,653 participants, 293 (4.4%) subjects had elevated ALT values and endorsed excessive alcohol consumption (ALD group). 479 (7.2%) subjects had elevated ALT values without a definite alternative etiology and endorsed minimal alcohol consumption (NAFLD group). Males were more frequently represented in the ALD group (79.8%) versus the NAFLD group (43.9%) (p=0.0009). Females were 5.2 times (OR 5.2, 95% CI 2.4-11.6) more likely to be in the NAFLD group. Age and ethnicity were not significantly different between the groups. Those with excess abdominal adiposity were 6.9 times (95% CI 2.2-21.2) more likely to be in the ALD group. The diagnosis of diabetes was 5.6 times
of OATPC was also diminished. In summary, the plasma mem-

branous localization of human OATPC is mediated by Golgi complex and vacuolar H+–ATPase vesicle-mediated membrane sorting pathways. cAMP-PKA regulates sorting process through the Golgi complex but not the vacuolar H+–ATPase associated vesicular pathway.

209 CHEMICAL CHAPERONES PARTIALLY REVERSE THE MIS-

PROCESSING OF A BRIC2 MUTANT OF THE BILE SALT

EXPORT PUMP, ABCB11

Ping Lam, Carol J. Soroka, James L. Boyer; Internal Med., Yale Uni-

versity, New Haven, CT

Background: Bile salt export pump (BSEP) is an ATP-dependent transporter that is expressed at the liver canalicular membrane. Abnormal retention of BSEP in intracellular compartments may be a cause of the human progressive and recurrent intrahepatic cholestasis (PFIC-2 and BRIC-2). PFIC-2 and BRIC-2 diseases represent a spectrum of intrahepatic phenotypes with PFIC-2 patients generally presenting a more progressive and severe phenotype than BRIC-2 patients. Chemical chaperones have been used successfully as a strategy to overcome misfolding of other mutant membrane proteins. We identified a BRIC-2 mutant that is misprocessed and hypothesized that this protein is misfolded and that chemical chaperones may correct the processing defect. Aim: To investigate the ability of chemical chaperones to reverse the misprocessing of a Bsep mutant R1128H. Methods: Mutant pEGFP-Bsep constructs were prepared from rat Bsep and stably transfected into HEK293 cells. Processing of Bsep is studied by endoglycosidases sensitivity and resolving the mature fully glycosylated and immature core-glycosylated form of the protein by Western immunoblotting. Biotinylation of surface proteins was used to detect cell surface expression of Bsep. Different compounds were added to stabilize R1128H protein and the effect on protein expression and processing was monitored by Western immunoblotting. Results: The R1128H is misprocessed leading to absence of protein expression at the cell surface. The mutant protein is localized intracellularly and co-localized with markers for the ER (Calnexin), ER-Golgi intermediate compartment (ERGIC-53) and Golgi marker (Golgin) as shown by confocal fluorescent microscopy, indicating that it may be recycling within ER and Golgi compartments. By Western immunoblotting, R1128H is expressed mostly as an immature core-glycosylated band. Inhibition of degradation of R1128H protein by proteasome inhibitor, MG-132 leads to accumulation in a perinuclear aggresome-like structure suggesting that the protein is abnormally folded. Reduced temperature (27°C), sodium butyrate, 4-

phenylbutyrate, glycerol or cyclopentamide (Csa) improved the processing of the core-glycosylated form into the fully glycosy-

lated form. Lower temperature and sodium butyrate can rescue and stabilize Bsep misfolded proteins at the cell surface.

5' UNTRANSLATED REGIONS (UTRS) OF HUMAN MULTIDRUG RESISTANCE PROTEIN 2 (MRP2) GENE REGULATE IN VITRO TRANSLATION
Yuanyuan Zhang1, Wei Li2, Mary Vore1; 1Graduate Center for Toxicology, University of Kentucky, Lexington, KY; 2Hematology Oncology, VA Hospital, Lexington, KY

Human multidrug resistance protein 2 (MRP2; ABCG2), an ATP-binding cassette transporter, effluxes organic anions into bile. The absence of functional MRP2 causes Dubin-Johnson syndrome associated with conjugated hyperbilirubinemia. Three transcription initiation sites of the MRP2 gene in liver have been identified at -245, -204 and -99 nucleotide (nt) relative to the MRP2 AUG (numbered +1, +2 and +3 nt). (Hepatology 30:1507). We investigated the distribution of MRP2 transcription initiation sites in human liver and HepG2 cells, and the effect of the untranslated regions (5'UTRs) on in vitro translation. Among the seven upstream start codon AUGs in the MRP2 gene, only the AUG at -105 nt has a perfect Kozak motif and encodes a 22 amino acid peptide from -105 nt to -37 nt. We also studied whether translational regulation is dependent on this putative peptide sequence. Methods and results: 1. Ribonuclease Protection Assay. Human liver and HepG2 cell RNAs were used to detect MRP2 transcription initiation sites. We found the transcription initiation sites at -245, -204, and -99 nt. The distribution patterns of these sites in liver and HepG2 cells were similar, with the -204 nt and -99 nt 5'UTR transcripts were expressed equally and the -245 nt 5'UTR transcript expression was at low level. 2. Transient co-transfection assay in HepG2 cells. pNL3 constructs containing the 5'UTRs of -245(Hu-L), -204(Hu-M) and -99(Hu-S) nt upstream of the luciferase reporter gene were cotransfected with pSV40-Ren to determine the effect of the 5'UTRs on firefly luciferase expression. In transfected HepG2 cells, the ratios of Fire/Ren luciferase activities of Hu-L, Hu-M, and Hu-S constructs were 1.2, 1.3, and 3.5, respectively. 3. In vitro translation assay. The 5'UTRs (-204(M) and -99(S) nt) were cloned into T7Luc control vector. A mutation at -105GAG→AAG was introduced into mutM construct to disrupt the upstream open reading frame (uORF). ΔhMRP2 construct was prepared to scramble the peptide sequence encoded from -105 nt to -37 nt in hMRP2 construct. Capped reporter messages were prepared from linearized constructs, and in vitro translation rates were determined in Rabbit Reticulocyte Lysate. The translation efficiencies of M, S, and mutM constructs relative to the T7Luc control vector were 0.27, 1.2, and 2.2, respectively. The relative translation efficiencies of hMRP2 and ΔhMRP2 constructs were not different (0.52 and 0.68, respectively). Conclusions: The uORF at -105 nt of the 5'UTR of MRP2 has a significant inhibitory effect on in vitro translation, but this inhibitory effect is not dependent on the sequence of the peptide encoded by this uORF. FOX2A REGULATES BILE ACID METABOLISM AND PREVENTS ER STRESS IN THE LIVER
Irina Bochkis, Nir Rubins, Peter White, Klaus Kaestner; Genetics, University of Pennsylvania, Philadelphia, PA

Purpose: Bile acids, synthesized in the liver, are potent detergents, crucial for the absorption of lipophilic nutrients. In addition, synthesis of bile acids is the predominant mechanism for the excretion of excess cholesterol. Dysregulation of bile acid homeostasis leads to cholestatic liver disease and induces cellular stresses, including ER stress. We investigated the role of Foxa2 in bile acid metabolism. Methods: Conditional gene ablation was used to derive mice deficient for Foxa2 in hepatocytes. Global location analysis ("ChIP-on-Chip") was employed to determine Foxa2 targets in the mouse liver. Labeled DNA samples were hybridized to two arrays, the Mouse PromoterChip BCBC-5A and the Mouse PromoterChip BCBC-5B. Mice were fed either normal chow or 0.5% cholic acid diet. Livers were analyzed for bile, cholesterol, triglyceride, and non-esterified fatty acid content. Serum ALT and AST levels were determined. Liver RNA was isolated from Foxa2loxP/loxP;Alfp.Cre and control littermates, and quantitative reverse transcription-PCR were performed for messenger RNA of genes crucial to bile acid homeostasis. Results: Deletion of Foxa2 in hepatocytes leads to a decrease in expression of conjugation (Slc27a5) and glutathione S-transferase enzymes (Gsta1, Gsta2, and Gstm2) and bile acid transporters (Oatp2, Mrp2, Mrp3, and Mrp4), both on the basolateral and canalicular membranes, resulting in reduced serum bile acid levels and mild cholestasis. Transcription of several of these genes is dependent directly on Foxa2. Challenging Foxa2 mutants with a diet containing cholic acid leads to severe intrahepatic cholestasis and a disproportionate rise in serum bile acids. Accumulation of hepatic bile acids is toxic, exacerbated by reduced expression of detoxification enzymes, and leads to ER stress and severe liver injury in Foxa2loxP/loxP;Alfp.Cre mice. Conclusions: We have found that Foxa2 regulates multiple genes involved in hepatic bile acid homeostasis. We demonstrate further that Foxa2 is required to prevent hepatic cholestasis, liver injury, and ER stress, when mice are fed a diet containing cholic acid. Thus, we have identified a novel role for Foxa2 in hepatic bile acid homeostasis and in the prevention of cholestatic liver injury.

THE MEMBRANE-BOUND BILE SALT RECEPTOR TGR5 IS EXPRESSED IN NON-PARENCHYMAL CELLS OF RAT LIVER
Verena Keitel, Dieter Häussinger, Ralf Kubitz; Clinic for Gastroenterology, Hepatology and Infectious Diseases, Heinrich-Heine-University, Duesseldorf, Germany

The G-protein coupled receptor TGR5 (Mbar, Gpbar-1) is the first plasma membrane-bound bile salt receptor described to date. We have recently demonstrated TGR5 expression in sinusoidal endothelial cells (SEC) and Kupffer cells (KC) of rat liver. Stimulation of TGR5 in SEC activated eNOS and increased NO production. Aim of this study was to investigate the expression of TGR5 in different liver cells in normal and diseased rat liver. Methods: An anti-rat TGR5 antibody was developed in our lab. Immunofluorescence staining of normal rat liver revealed that TGR5 is not only expressed in SEC and hepatic stellate cells. TGR5 specific agonists BR26 and tetrachloride treated cirrhotic rats (12 weeks) were stained with the anti-TGR5 antiserum. Antibodies directed against KC (ED2), bile duct epithelial cells (CK19) and cholangiocytes (Taq) were used to identify the non-parenchymal liver cells. Results: Immunofluorescence staining of normal rat liver sections revealed that TGR5 is not only expressed in SEC and...
EXENDIN-4 PROTECTS CHOLANGIOCYTES FROM APOPTOSIS, BOTH IN VITRO AND IN VIVO

Marco Marzioni1, Gianfranco Alpini2, Stefania Saccomanno1, Grammmaro Fava1, Cinzia Candelaresi1, Chiara Ryhlicki1, Heather L. Francis2, Luciano Trozzi1, Julie Venter2, Antonio Benedetti1; 1Department of Gastroenterology, Università Politecnica delle Marche, Ancona, Italy; 2Division Research & Education, Navarra School of Medicine, Clinica Universitaria and CIMA, Pamplona, Spain

Progression of chronic cholestatic disorders towards ductopenia results from the dysregulation of cholangiocyte survival, with cell death by apoptosis prevailing over compensatory proliferation. Currently, no therapy is available to sustain cholangiocyte survival in the course of those disorders. Cholangiocyte biology and response to injury is regulated by neuropeptides and neuroendocrine hormones. Glucagon-Like Peptide-1 (GLP-1) is secreted by enteroendocrine cells and acts as growth regulator in many cells and tissues. We have recently shown that cholangiocytes express the GLP-1 receptor (GLP-1R), the activation of which results in a significant enhancement of the cellular adaptive reaction to cholestasis. The GLP-1R selective agonist exendin-4 sustains pancreatic beta-cell proliferation and prevents cell death by apoptosis. For such properties, exendin-4 is now employed in humans as a novel therapy for diabetes. In cholangiocytes, we have shown that GLP-1R activation by exendin-4 enhances the activity of PI3K, cAMP/PKA and Ca2+-CamKinase-alpha pathways. Aim: to verify whether exendin-4 is effective in preventing cholangiocyte apoptosis. Methods: in vitro, we tested if exendin-4 (100 nM) is able to prevent apoptosis of cholangiocytes isolated from normal rats induced by glycochenodeoxycholic acid (GCDCA, 400 microM). Cholangiocyte apoptosis was also induced in vivo by the administration, 7 days after bile duct ligation (BDL), of a single IP injection of CCl4. Animals were also treated with either control or exendin-4 injections for 3 days. Results: GCDCA incubation enhanced bax mitochondrial translocation, cytochrome c release and caspase 3 activity; such changes were prevented by the pre-incubation with exendin-4. PI3K, but not cAMP/PKA and Ca2+-CamKinase-alpha, inhibitors neutralized the effects of exendin-4 on caspase 3 activity, bax mitochondrial translocation and cytochrome c release. In vivo, exendin-4 administration prevented the increase in TUNEL positive cholangiocytes observed in BDL rats treated with CCl4. Exendin-4 treatment also prevented the loss of bile duct mass induced by CCl4 in BDL rats. Summary/conclusion: exendin-4 prevents cholangiocyte apoptosis both in vitro and in vivo; such an effect is due to the ability of exendin-4 to counteract the activation of the mitochondrial pathway of apoptosis. Exendin-4 anti-apoptotic properties are mediated by PI3K. These novel data indicate that exendin-4 is effective in protecting cholangiocytes from apoptosis associated with chronic cholestasis. These findings support the hypothesis that exendin-4 may be effective in relenting the progression of cholangiopathies towards ductopenia.

214 EXPRESSION OF SOLUTE TRANSPORTERS AND WATER CHANNELS IN ARPKD: IMPLICATIONS FOR HEPATIC CYSTOGENESIS

Jesus M. Banales1,2, Pamela S. Tietz1, Seung-Ok Lee1, Bing Q. Huang1, Jatyana V. Masys1, Angela J. Stroope1, Sergio A. Gradilone1, Anatoly I. Masys1, Juan F. Medina1, Nicholas F. LaRusso2; 1Internal Medicine, Mayo Clinic College of Medicine, Rochester, MN; 2Laboratory of Molecular Genetics, University of Navarra School of Medicine, Clinica Universitaria and CIMA, Pamplona, Spain

BACKGROUND: In Autosomal Recessive Polycystic Kidney Disease (ARPKD), kidney and liver cysts progressively grow and expand over time, likely because of disturbances in cell proliferation, apoptosis, and/or water and solute transport. We recently reported that in the PCK rat, an animal model of ARPKD, liver cysts are derived from cholangiocytes, the epithelial cells that line bile ducts. We also showed that in 3-D culture, PCK bile duct explants expand at a 3-fold greater rate than normal explants. Finally, we demonstrated that cholangiocytes contain organelles that sequester functionally related transport proteins (the water channel, aquaporin-1 [AQP1]; the chloride channel, CFTR; and the anion exchanger, AE2) that account for ion-driven ductal water transport. Since abnormalities in fluid movement may play a role in cyst expansion in ARPKD, we tested the hypothesis that the relative expression and topographic locations of AQP1, CFTR, and AE2 are abnormal in PCK cholangiocytes. METHODS: Expression of AQP1, CFTR, and AE2 was assessed by quantitative RTPCR and Western-blots on tissue sections from both freshly isolated and cultured cholangiocytes from normal and PCK rats, and by immunofluorescent confocal microscopy in liver sections. Topographic distribution of the proteins within cholangiocytes was assessed by immunofluorescent confocal microscopy in liver sections. Topographic distribution of the proteins within cholangiocytes was assessed by confocal microscopy in whole liver sections. RESULTS: mRNA levels for AQP1, CFTR, and AE2 are abnormal in PCK cholangiocytes. METHODS: Expression of AQP1, CFTR, and AE2 was assessed by quantitative RTPCR and Western-blots using both freshly isolated and cultured cholangiocytes from normal and PCK rats, and by immunofluorescent confocal microscopy in liver sections. Topographic distribution of the proteins within cholangiocytes was assessed by immunofluorescent confocal microscopy in liver sections. Topographic distribution of the proteins within cholangiocytes was assessed by confocal microscopy in whole liver sections. RESULTS: mRNA levels for AQP1, CFTR, and AE2 were increased (8, 4 and 3-fold, respectively) in PCK cholangiocytes (p<0.05) compared to normal. By Western-blots, AQP1, CFTR and AE2 were also increased (4, 3 and 3-fold, respectively) in PCK cholangiocytes compared to normal (p<0.05). Moreover, in PCK bile duct explants grown in 3D-culture, levels of expression of the three proteins correlated with cyst expansion. Over-expression of the three proteins was confirmed by immunofluorescent confocal microscopy and by immunoelectron microscopy in the whole liver. In cholangiocytes in whole normal liver, AQP1, CFTR and AE2 are preferentially localized to the apical membrane; in contrast, in cholangiocytes in PCK...
livers, the three proteins maldistribute to the basolateral membrane. CONCLUSION: Cholangiocytes from an animal model of ARPKD are characterized by over-expression and altered intracellular topography of three proteins (AQP1, CFTR, and AE2) critically involved in ductal bile formation. The data are consistent with the possibility that abnormalities in the function of these three proteins may contribute to hepatic cystogenesis.

NM23-H2 INHIBITS CHOLANGIOCARCINOMA GROWTH BY BINDING TO AND DOWNREGULATING PPARδ

Xuefeng Xia, Wenzheng Zhang, Yuhua Xiao, Dongbing Gao, Gene D. LeSage; Internal Medicine, University of Texas Medical School at Houston, Houston, TX

Background & Aims: The nuclear receptor peroxisome proliferator-activated receptor δ (PPARδ/δ) has been linked colorectal, breast, hepatocellular and prostate cancers. The mechanism for PPARδ-induced carcinogenesis is unknown. Our previous studies showed PPARδ is overexpressed in cholangiocarcinoma and PPARδ agonists increase cholangiocarcinoma growth. We hypothesized that deregulation of coregulators of PPARδ may lead to its overexpression in cancer. To identify candidate proteins, we performed a yeast two-hybrid screen using mouse PPARδ, where we identified a novel PPARδ-binding protein, NM23-H2, also known as NME2, NM23B and NDKB, which is an isoform of multifunctional proteins involved in a variety of cellular activities including cell proliferation, development, motility, adhesion, and differentiation. Aims: We determined if NM23-H2 binds to and regulates PPARδ expression and PPARδ-dependent cholangiocarcinoma growth. Methods: Yeast two-hybrid screening was performed using mouse PPARδ bait vector which was transformed with mouse kidney cDNA library. PPARδ and NM23-H2 expression were determined by real-time RT-PCR and western immunoblots in cultured normal rat cholangiocytes (NRC) and human cholangiocarcinoma cell lines. GFP-tagged PPARδ and RFP-tagged NM23-H2 were used for colocalization by immunofluorescence microscopy. PPARδ promoter activity was determined by dual luciferase assays. Cell cycle analysis was performed by FACS. Results: Yeast two-hybrid screening identified NM23-H2 as a binding protein, which interacts with C-terminal region of PPARδ. PPARδ and NM23-H2 interaction was confirmed by communoprecipitation, GST pull-down assays and colocalization in the cytoplasm by fluorescence microscopy. Overexpressed PPARδ or treatment with the PPARδ agonist GW501516 (GW) resulted in increased cell proliferation and expression of the proliferation marker Cdk2 in cholangiocarcinoma cells. Loss of NM23-H2, due to siRNA, activated PPARδ luciferase promoter activity, upregulated PPARδ RNA and protein expression and increased GW-stimulated cholangiocarcinoma growth. Overexpression of NM23-H2 inhibited the PPARδ luciferase promoter activity, downregulated PPARδ RNA and protein expression, induced apoptosis, and reduced GW-stimulated cholangiocarcinoma growth. Summary and Conclusions: We report the novel observation that the association of NM23-H2 with PPARδ negatively regulates PPARδ expression by binding to C-terminal region of PPARδ. Our observations provide the first evidence that the metastasis suppressor, NM23-H2, is involved in the regulation of PPARδ-mediated proliferation and PPARδ-induced carcinogenesis.

SMALL CHOLANGIOCYTES PROLIFERATE IN RESPONSE TO H1 HISTAMINE RECEPTOR STIMULATION VIA ACTIVATION OF THE IP3/CA2⁺/CAMK/CREB-DEPENDENT PATHWAY

Heather Francis², Sharon DeMorrow², Shannon Glaser³, Julie Wanter², Shelley Vaculin², Yoshiyuki Ueno³, Bradley Vaculin³, Gianfranco Alpini¹; ¹Research, Medicine and Systems Biology and Translation Medicine, Central Texas Veterans Health Care System, Scott & White and Texas A & M Health Science Center College of Medicine, Temple, TX; ²R&E, Scott & White, Temple, TX; ³Research, Central Texas Veterans Health Care System, Temple, TX; ⁴Medicine, Texas A&M HSC College of Medicine, Temple, TX; ⁵R&E and Medicine, Scott & White and Texas A & M HSC COM, Temple, TX; ⁶Gastroenterology, Medicine, Tohoku University School of Medicine, Sendai, Japan

Cholangiopathies are characterized by the heterogeneous proliferative responses of different sized bile ducts. Constitutively dormant, small cholangiocytes proliferate de novo only in pathological conditions of damage of large ducts (e.g., by CCl4 treatment). Histamine differentially regulates cholangiocyte growth by increasing proliferation by interaction with H1/H2 histamine receptors (H1/H2R), but decreasing mitosis via activation of H3/H4R. Binding of H1 agonists to H1R increases intracellular Ca2⁺ levels, which are coupled with calmodulin-dependent stimulation of CaM kinase, and activation of the transcription factor, CREB. We have shown that: (i) small and large murine cholangiocytes express H1-H4R; and (ii) the H1R agonist, HTMT dimaleate, increases the growth of small but not large murine cholangiocytes. We aim to expand our earlier studies and further elucidate the intracellular mechanisms by which H1R stimulates the growth of small murine cholangiocytes. Methods: We used our immortalized small and large murine cholangiocyte lines that were stimulated with 0.2% BSA or HTMT dimaleate (a H1R agonist, 10 × 10⁻⁶ M) for 24 and 48 hours in the absence or presence of: terfenadine (H1R antagonist, 10 μM); BAPTA/AM (intracellular Ca2⁺ chelator, 1 μM); and W-7 (CaMK inhibitor, 10 μM). Proliferation was determined by MTs assay. IP₃ and cAMP levels were determined in small and large cholangiocytes treated with BSA or HTMT dimaleate. Phosphorylation of CaMK I (Thr 177) was measured in small cholangiocytes treated with HTMT dimaleate. We evaluated CREB activation in nuclear extracts from small cholangiocytes treated with BSA or HTMT dimaleate with/without W-7. Knock-down experiments were performed with shRNA plasmid for CaMK. Real time PCR was used to determine CaMK knock-down efficiency and MTs (in the absence or presence of HTMT dimaleate) was performed. RESULTS: Small but not large cholangiocytes proliferate in response to the H1R agonist, proliferation that was blocked by terfenadine, BAPTA/AM and W-7. IP₃ (but not cAMP) levels were increased in small cholangiocytes treated with HTMT dimaleate. HTMT dimaleate increased the phosphorylation of CaMK I compared to basal levels. H1 stimulation induced activation of CREB that was blocked by W-7. shRNA experiments resulted in an ablation of the effects of H1 stimulation on small cholangiocyte growth. Conclusion: Activation of the H1R induces an increase in small cholangiocyte growth by IP₃/CA2⁺/CaMKInase I-dependent phosphorylation of CREB. Differential regulation of small and large cholangiocyte growth by histamine may be important in the treatment of cholangiopathies targeting specific-sized ducts.
PROGESTERONE REGULATES CHOLANGIOCYTE PROLIFERATION DURING CHOLESTASIS BY AUTOCRINE SIGNALING MECHANISMS

Cholangiocytes possess the pathway for progesterone (PROG) levels are increased with bile duct ligation (BDL) suggesting that PROG may affect biliary growth during cholestasis. We examined the following: Do cholangiocytes express receptors for PROG? Does PROG regulate cholangiocyte growth and Do cholangiocytes possess the pathway for PROG steriodogenesis? Methods: The studies were performed in female and male normal and 1-wk BDL rats. Nuclear (PR-A and PR-B) and membrane (PRGMC1 and PRGMC2) PROG receptor expression was determined by: (i) immunofluorescence in liver sections and NRIC; and (ii) RT-PCR in isolated cholangiocytes and NRIC. The in vivo effects of PROG on cholangiocyte growth were determined by administration of PROG (50 mg/kg/day IP) to normal rats for 1 week. Also, immediately after BDL rats were treated with a neutralizing PROG antibody (6.5 nmol/day IP) or non-immune serum for 1 week. Subsequently, cholangiocyte growth was measured by evaluation of the number of bile ducts in liver sections.

The biosynthesis pathway for the steroidogenesis of progesterone consists of three key enzymes: steroidogenic acute regulator, cytochrome p450 side-chain cleavage, and 3 β-hydroxysteroid dehydrogenase. The expression of the three enzymes was evaluated by: (i) immunofluorescence in liver sections and NRIC; and (ii) RT-PCR in isolated cholangiocytes and NRIC. Cholangiocyte PROG secretion was evaluated in primary cultures (6 hours) of isolated normal and BDL cholangiocytes. The effect of PROG on cholangiocyte proliferation was evaluated in NRIC stimulated in vitro with PROG (10³ M), and supernatant (containing progesterone) from cholangiocytes in the presence/absence of anti-progesterone antibody. Results: Cholangiocytes and NRIC express the PR-A and PR-B nuclear receptor and PRGMC1 and 2. In vivo, PROG increased the number of bile ducts of normal rats. Anti-PROG inhibited cholangiocyte growth stimulated by BDL. Normal and BDL cholangiocytes expressed the biosynthetic pathway for PROG production and secrete PROG. In vitro, PROG increased the proliferation of NRIC and the supernatant from cholangiocytes increased biliary proliferation, which was partially inhibited by preincubation with anti-progesterone suggesting an autocrine pathway in the regulation of cholangiocyte growth.

CONTRIBUTION OF COMBINATORIAL LIGAND LIBRARIES TO THE HUMAN BILE PROTEOME: NEW IDENTIFICATIONS AND PROMINENCE OF BINDING PROTEINS

Luc Guerrier1, Stephane Clavero2, Laetitia Finzi3, Frederic Fortis3, Egisto Boschetti4, Chantal Housset5; 1Bio-Rad Laboratories, CEA-Saclay, Gif-sur-Yvette, France; 2Pôle Proteomique, Plateforme Genomique Fonctionnelle Bordeaux - Pôle Proteomique, Université Bordeaux 2, Bordeaux, France; 3UMR_S 680, Inserm, Université Pierre et Marie Curie - Paris 6, Paris, France.

Background: Proteins in bile may have important physiological functions and serve as disease biomarkers. The aim of this study was to identify proteins in normal human gallbladder bile, using a technology of combinatorial ligand libraries, capable to enhance the signal of hidden or low abundance species. Methods: Gallbladder bile was collected from 13 subjects without biliary tract disease who underwent cholecystectomy during liver/pancreas surgery. The proteins present in 275 mL of pooled bile fluid were treated with two serially connected hexapeptide ligand libraries with physicochemical complementary properties. The first library had a primary amine as a terminal group while the second one, had a carboxyl terminal group. The recovery of captured proteins was performed by three elution steps addressing different types of protein interactions (hydrogen bonding, ion exchange and low interaction forces, hydrophobic associations). The analysis of resulting protein mixture was performed by LC-MS/MS. Results: Overall 222 gene products were found; 143 of them were never reported before in bile proteomics studies. Ligand libraries by themselves contributed to find 81 new gene products distributed throughout different categories. The classification into functional categories showed that the proportion of binding proteins was the highest (more than 50 %). This category included immunoglobulin chains, complement precursors and other immune defense proteins. Different newly identified proteins participate in the biliary antimicrobial defense, e.g. azorucidin, or defensin, produced by cholangiocytes. Three major apomucins produced by the gallbladder epithelium (MUC-1, MUC-SAC, MUC-SB) were also detected. The next most frequent functional classes included transport and structural proteins (e.g. actin and actin-binding proteins of the Ezrin-Radixin-Moesin family), catalytic and enzyme regulator activities (e.g. dipeptidyl peptidase 4, an enzyme localized in the apical membrane of hepatocytes and cholangiocytes). We also identified detoxifying enzymes derived from hepato-biliary lining cells (i.e. glutathione S-transferases, of three types, microsomal, alpha and pi, and superoxide dismutase,...) which may provide protection against toxicants eliminated in bile. Conclusions: As a global view from known proteomics studies performed on bile, the number of known species from bile fluid reaches 288 gene products. The present investigation contributes for 143 proteins, about half of them being discovered, as a result of peptide ligand libraries. The described method opens new perspectives for the discovery of markers for specific biliary tract diseases.

EXTRACELLULAR ATP INDUCES IL-6 TRANSCRIPTION IN BILE DUCT EPITHELIAL CELLS VIA THE P2Y11 RECEPTOR
Jin Yu, Nina Sheung, Jonathan A. Dranoff; Internal Medicine/Digestive Diseases, Yale University School of Medicine, New Haven, CT

Background. Bile duct epithelia (BDE) release the pro-inflammatory cytokine IL-6, which is upregulated in biliary cirrhosis. Recently, we demonstrated that release of IL-6 induces down-regulation of the ecto-nucleotidase NTPDase2, a critical regulator of bile ductular proliferation, by portal fibroblasts. However, the mechanisms regulating release of IL-6 by BDE have not been defined. Several groups have identified multiple P2Y receptors for ATP and other nucleotides expressed by BDE. Thus, the aims of this study were to determine whether extracellular ATP regulated BDE IL-6 upregulation and to identify the molecular mechanisms regulating this process. Methods. Immuno-isolated rat BDE were used for all studies. The effects of the following nucleotides (ATP, ADP, AMP, UTP, and UDP; 100 µM each) on IL-6 mRNA expression were determined by quantitative RT-PCR. The effect of cytosolic Ca²⁺ was determined using the Ca²⁺ chelator BAPTA/AM, and the effect of cAMP was determined using the cAMP-dependent protein kinase inhibitor Rp-cAMP. The effects of ATP on BDE cAMP levels was determined by ELISA. Results. ATP upregulated IL-6 mRNA expression to 2.18 ± 0.37-fold of control (p < 0.0001), yet ADP, UTP, UDP did not upregulate IL-6 transcription. No effect was noted with AMP (negative control), and the effect of ATP was blocked by the P2Y inhibitor suramin (50 µM; p = 0.0001 vs. ATP). The pharmacologic profile for IL-6 upregulation was most consistent with the newly identified P2Y₁₁ receptor. Since the P2Y₁₁ receptor is coupled to both cytosolic Ca²⁺ and cAMP generation, we assessed the effect of inhibition of Ca²⁺ signals and cAMP on ATP-dependent IL-6 upregulation. Both BAPTA/AM and Rp-cAMP inhibited the IL-6 upregulation, consistent with the known pharmacology for P2Y₁₁. Furthermore, extracellular ATP upregulation of BDE cAMP levels (from 1.82 ± 0.59 to 3.14 ± 0.24 fmol/10⁴ cells; p < 0.05). Conclusions. This is the first description of the novel P2Y receptor subtype P2Y₁₁ in BDE. Activation of the P2Y₁₁ receptor transcriptionally upregulates IL-6 via Ca²⁺- and cAMP-dependent pathways. These experiments suggest that purinergic regulation of cytokine release is a novel mechanism that is important in the pathogenesis of biliary cirrhosis.

The rat and human intrahepatic biliary epithelium is morphologically and functionally heterogeneous. Since no information exists on the heterogeneity of the murine intrahepatic biliary epithelium and with increased usage of transgenic mouse models to study liver disease pathogenesis, we sought to evaluate the morphological, secretory, proliferative and apoptotic phenotypes of small and large bile ducts in normal and cholestatic models of liver injury. Methods: For morphometry, two normal mouse livers (C57/BL6) were dissected into blocks of 2-4 mm², embedded in paraffin, sectioned, and stained with H&E. Sizes of bile ducts and cholangiocytes were evaluated by using SigmaScan to measure the diameters of a total of 38 bile ducts and 250 cholangiocytes. In small and large normal cholangiocytes, we evaluated the mRNA expression of cholangiocyte specific markers, cytokeratin-19 (CK-19) and secretin receptor (SR) by real time PCR; and cAMP levels in response to secretin (100 nM). To evaluate cholangiocyte proliferative responses after bile duct ligation (BDL), small and large cholangiocytes were isolated from 3-day BDL mice, and proliferation was analyzed by PCNA expression and by the number of CK-19-positive bile ducts in liver sections. We treated normal mice with a single dose of carbon tetrachloride (CCL₄; 0.5 mg/Kg BW, IP) and evaluated the proliferation of: small and large ducts by PCNA and CK-19 immunohistochemistry; and apoptotic small and large cholangiocytes by TUNEL analysis in liver sections. Results: In situ morphometry established that mean minor x major diameters for bile ducts classified as small and large were approximately 12 x 26 µm and 284 x 643 µm, respectively. The diameter of cholangiocytes lining small ducts was 7.3 ± 1.6 µm, and of those lining large ducts was 15.4 ± 2.6 µm. Regression analysis showed that a significant relationship exists between cholangiocyte area and bile duct diameter (R = 0.82, p < 0.001). We isolated small (≈7.3 µm diameter) and large (≈15.6 µm diameter) cholangiocytes. Both small and large cholangiocytes express CK-19 and only large cholangiocytes express SR mRNA and respond to secretin with increased cAMP levels. Following BDL in mice, only large cholangiocytes proliferate leading to increased ductal mass. Acute CCL₄ induced the necrosis of centrilobular hepatocytes and apoptosis of only large cholangiocytes, associated with decreased large bile duct mass and increased numbers of small ducts. Conclusion: Similar to rats, mouse intrahepatic biliary epithelium is morphologically and functionally heterogeneous. The mouse is a suitable model for defining the heterogeneity of the biliary tree.

HEDGEHOG SIGNALING AND EPITHELIAL MESENCHYMAL TRANSITIONS DURING BILARY FIBROSIS
Alessia Omenetti1, Alessandro Porrello2, Yury Popov3, Liu Yang1, Youngmi Jung1, Hendrika M. Vandonen1, Detlef Schuppan3, Anna Mae Diehl1; 1Medicine, Division Gastroenterology, Duke University Medical Center, Durham, NC; 2Institute for Genome Sciences and Policy, Duke University, Durham, NC; 3Division of Gastroenterology and Hepatology, Beth Israel Deaconess Medical Center, Harvard University, Boston, MA

Background Epithelial-mesenchymal transitions (EMT) may occur in primary biliary cirrhosis (PBC) (Hepatology 45:977-81, 2007), but the mechanisms involved are unknown. The Hedgehog (Hh) signalling pathway regulates EMT. We reported that portal tracts in PBC livers accumulate Hh-responsive cells, and showed that paracrine Hh-signaling between co-cultured bile ductular cells (BDC) and myofibroblasts (MF) modulates the growth and viability of both cell types. Aim To determine if BDC near Hh-producing MF undergo EMT. Methods In vitro An immortalized murine BDC line (H03B) and a clonally derived rat MF cell line (BB) were placed in monocultures or co-cultured for 6 days in a transwell system that increases Hh in the medium. BDC mRNA was harvested and pooled from 6 wells/plate/experiment, and used to make RNA probe for microarray analysis (Affymetrix Mouse 430-2 GeneChips® (N=3 experiments). Selected microarray results were confirmed by QRT PCR. In vivo Biliary fibrosis was induced in 32 rats by bile duct ligation (BDL). Bilio-jejunal Roux-en-Y (RY) anastomosis was performed 4 weeks post-BDL, and liver samples were collected during 12 weeks of recovery and processed for RNA analysis. Expression of the EMT marker, S100A4, was co-localized with vimentin by immunohistochemistry (IHC) in human PBC samples. Results Compared to BDC monocultures, BDC co-cultured with MF exhibited significant up-regulation and down-regulation of 965 and 235 genes, respectively. The most over-expressed gene, Lipocalin2 (Lcn2, +3665%, p < 0.001), is involved in EMT. Ontogeny analysis of Cell differentiation (57 up- and 26 down-regulated genes), Development (129 up- and 55 down-regulated genes) and Cytoskeleton (55 up-regulated genes) gene sets confirmed an induction of various mesenchymal genes, including fibronectin, α(I) (+6000%). Gene expression normalized by 12 reference genes, showed that paracrine Hh-signaling between co-cultured bile ductular cells (BDC) and myofibroblasts (MF) modulates the growth and viability of both cell types. Aim To determine if BDC near Hh-producing MF undergo EMT. Methods In vitro An immortalized murine BDC line (H03B) and a clonally derived rat MF cell line (BB) were placed in monocol-+

222 TREATMENT WITH URSODEOXYCHOLIC ACID, BUT NOT WITH CHOLIC ACID, INCREASES BILE FLOW INDEPENDENTLY OF CYSTIC FIBROSIS TRANSMEMBRANE REGULATOR IN MICE
Frank Bodewes1, Marjan Wouthuizen-Bakker1, Rick Havinga1, Marcel Bijvelds2, Hugo de Jonge2, Henkjan Verkade1; 1Pediatric Gastroenterology and Hepatology, University Medical Center, Groningen, Netherlands; 2Biochemistry, Erasmus Medical Center, Rotterdam, Netherlands

BACKGROUND: Ursodeoxycholic acid (UDCA) treatment is frequently applied for cystic fibrosis-related liver disease (CFLD). It has been hypothesized that UDCA is beneficial through its choleretic activity. The hepatic expression of the CFTR protein is restricted to the cholangiocytes. Here CFTR is involved in the generation of ductular bile flow. It is not known to what extent the choleretic activity of bile salt treatment depends on expression of competent CFTR protein, and whether or not UDCA differs in this respect from other bile salts. We evaluated the role of CFTR in the acute and chronic choleretic effect of bile salt treatment, through comparative studies in Cfr-null, homozygous F508del, and corresponding wild type control (WT) mice. METHODS: Bile flow (BF) was determined after gallbladder cannulation. BF during 30 minutes after acute interruption of the enterohepatic circulation was regarded as basal BF. After 30 min, taurocholic acid (TCA) or tauroursodeoxycholic acid (TUDCA) were i.v. administered in stepwise increasing dosages, up to 1200 nmol/min/100 g BW, to Cfr-null mice and WT littersmates fed a standard chow diet. Other Cfr-null, homozygous F508delΔ/Δ mice and their respective WT littersmates were fed either the standard chow, or the same diet supplemented with cholic acid (CA, 0.5 wt%) for 3 weeks. Finally, Cfr-null mice and WT littersmates were fed the standard chow or the same diet supplemented with UDCA(0.5 wt%) for 3 weeks. RESULTS: Upon a regular chow diet, the basal BF was similar in Cfr-null and F508delΔ/Δ mice, compared to their respective WT littersmates (Cfr-null, 6.3±1.8 vs. 6.2±0.1; and, F508delΔ/Δ, 5.4±2.8 vs. 8.5±10.8 μl/min/100 g BW, resp.; NS). i.v. administration of TCA or TUDCA to Cfr-null mice and WT littersmates increased BF to similar extents. Dietary CA treatment increased basal BF significantly less in Cfr-null and F508delΔ/Δ mice than in their respective WT littersmates (Cfr-null, 13.7±3.0 vs. 17.9±1.7, p<0.05; and, F508delΔ/Δ, 20.9±5.5 vs. 26.2±6.2 μl/min/100 g BW, p=0.06; resp.). Interestingly, dietary UDCA treatment increased basal BF more profoundly than CA treatment, and to similar levels in Cfr-null mice and WT (40.0±5.9 vs. 31.0±4.4 μl/min/100 g BW, resp.; NS). CONCLUSION: Upon chronic treatment, UDCA is highly choleretic in mice, independently of the presence of functional CFTR. The independence of functional CFTR is UDCA specific, since the choleretic activity of chronic CA treatment is diminished in Cfr-null and homozygous F508del mice. We speculate that this specific, Cfr-independent choleretic effect of chronic UDCA treatment could be therapeutically important for cystic fibrosis.

DEFICIENCY OF TRAIL OR OVEREXPRESSION OF HUMAN MCL-1 ATTENUATES LIVER INJURY IN THE BILE DUCT LIGATED MOUSE
Alisan Kahraman1,2, Fernando J. Barreyro1, Steven F. Bront1, Nathan W. Werneburg1, Justin L. Matt1, Karen Braley1, Ruth W. Craig3, Gregory J. Gores1; 1Mayo Clinic College of Medicine, Rochester, MN; 2University Hospital Essen, Essen, Germany; 3Dartmouth Medical School, Hanover, NH

Hepatocellular apoptosis is a key mechanism of liver injury during cholestasis. Apoptosis during cholestasis is triggered by hepatotoxicity of toxic bile acids. Although we have reported that toxic bile acids increase hepatocyte expression of tumor necrosis factor-related apoptosis inducing ligand (TRAIL) death receptor 5 (DR5), the contribution of TRAIL and its opponent myeloid cell leukemia sequence-1 (Mcl-1) to cholesiatic liver injury have not been explored. Thus, our AIM was to ascertain if genetic deficiency of TRAIL or overexpression of human Mcl-1 (hMcl-1) attenuates liver injury in the bile duct ligated (BDL) mouse. METHODS: C57/Bl6 wild-type (wt), TRAIL knockout (TRAIL-/-) and hMcl-1 transgenic (TG) mice were used for these studies. Real-time polymerase chain reaction (PCR) was used to measure mRNA transcripts for TRAIL. Hepatocyte apoptosis was quantified by the Tunel assay and immunofluorescence for activated caspases 3/7. Liver injury was assessed by histopathology, quantification of bile ducts and serum ALT determinations. Hepatic fibrosis was assessed by Sirius red staining and quantitative morphometry. RESULTS: Following 7 days of BDL, hepatic TRAIL mRNA was 6-fold greater in BDL vs. sham-operated wild-type animals (p < 0.01). As compared to sham-operated wild-type mice, BDL mice displayed a 13-fold increase in Tunel and an 11-fold increase in caspase 3/7 positive hepatocytes (p = 0.01). The number of Tunel and caspase 3/7 positive cells was reduced by > 80% in BDL TRAIL knockout and hMcl-1 TG animals (p < 0.01). Consistent with the apoptosis data, histologic examination of TRAIL knock out and hMcl-1 TG BDL livers also demonstrated a 50% reduction in the number of bile ducts as compared to wild-type BDL mice. Serum ALT values, which were increased 200-fold in wild-type BDL vs. sham-operated animals, were also reduced by > 80% in TRAIL knockout or hMcl-1 TG BDL mice. These differences could not be ascribed to differences in cholestasis as serum total bilirubin concentrations were nearly identical in wt, TRAIL knock out and hMcl-1 TG BDL mice (12.15 mg/dL). Finally, hepatic fibrosis was 3-fold increased in wt as compared to hMcl-1 TG animals following 14 days of BDL. In CONCLUSION: The present study demonstrates that in the BDL mouse, hepatocyte apoptosis, liver injury and hepatic fibrosis are attenuated in the TRAIL-deficient or hMcl-1 TG mouse. In conclusion, these observations support a pivotal role for TRAIL-mediated liver injury that can be inhibited by Mcl-1 and further define conditions under which TRAIL is hepatotoxic.

STIGMASTEROL INHIBITS BILE ACID – INDUCED ACTIVATION OF HETEROMERIC BILE ACID TRANSPORTER GENES Ostx/β
Olga A. Taylor, Astrid Kosters, Damara White, Saul J. Karpen, Beth A. Carter; Baylor College of Medicine, Houston, TX

Background: The heteromeric transporter Ostx/β (organic solute transporter) is expressed on the basolateral side of hepatocytes and functions to efflux organic solutes including bile acids (BA). It has been previously shown that Ostx/β genes are upregulated in both human and mouse models of cholestasis, principally by FXR (farnesoid X receptor)-mediated pathways. The molecular mechanism of Total Parenteral Nutrition-associated cholestasis (TPNAC) is unknown, but there is evidence to suggest that BA efflux from hepatocytes may be impaired. We hypothesized that Stigmasterol (Stig), a phytosterol that is an obligate component of TPN lipids, interferes with BA-induced Ostx and/or Ostβ expression at the RNA and/or protein level in human and murine hepatocytes. Methods: HepG2 cells and primary mouse hepatocytes isolated from 8-10 week old C57BL/6 male mice (n = 4-6 mice/group) were cultured using standard protocols. Cells were maintained in 0.25% charcoal stripped serum media and treated with 50 µM chenodeoxycholic acid (CDCA) with or without 10 µM Stig or vehicle (DMSO). Cells were harvested 24 hrs post treatment for RNA isolation and protein extraction. qRT-PCR and western blot analysis were performed to determine changes in Ostx/β gene and protein expression. Electromobility shift assay was performed to assess nuclear protein binding to FXR elements in Ostx and Ostβ promoters. Results: In HepG2 cells, CDCA-induced mRNA expression of Ostx and Ostβ was 28 and 19-fold respectively. Stig reduced CDCA-induced mRNA expression of Ostx by 29% (p<0.01) and of Ostβ by 47% (p<0.05) vs CDCA alone. In primary mouse hepatocytes, Ostβ mRNA expression was increased 32-fold by CDCA treatment which was reduced by 34% (p<0.05) in the presence of Stig; no changes were seen in Ostx mRNA with any treatments. Western blot analysis of primary mouse hepatocytes showed no change in Ostx protein levels between all treatment groups; CDCA-induced Ostβ protein levels (4-fold) were reduced by 63% (p<0.05) with Stig vs CDCA alone. Electromobility shift assay revealed CDCA-induced nuclear protein (previously shown to be FXR) binding to the Ostx promoter was reduced by 94% (p<0.01) with Stig vs CDCA alone; Stig had no effect on protein binding to the Ostβ promoter in HepG2 cells. Conclusion: Our data indicates that Stig may contribute to hepatotoxicity seen in infants with TPNAC by interfering with BA transport by antagonizing BA induced expression of FXR target genes Ostx/β. Thus, resulting in accumulation of BA within hepatocytes and ultimately hepatocellular damage. This data furthers our ongoing molecular explanation for the development of TPNAC in infants on long-term TPN.

FIC1 DEFICIENT RAT HEPATOCYTES REVEAL STRUC-TURAL AND FUNCTIONAL DEFECTS IN THEBILE CANALICULAR MEMBRANE WHEN EXPOSED TO HYDROPHOBIC BILE ACIDS
Shi-Ying Cai, Samir Gautam, Trong Nguyen, Carol J. Soroka, Christoph Rahner, James L. Boyer; Yale University; New Haven, CT

Background: FIC1 (ATPB8B) is a P4-type ATPase which is a putative aminophospholipid flippase. FIC1 is broadly expressed and localized at the apical membrane of epithelial cells including hepatocytes and cholangiocytes. Mutations in FIC1 gene result in progressive familial intrahepatic cholestasis type 1 (PFIC1) where reduced expression of the bile acid nuclear receptor FXR (NR1H4) has also been observed. In contrast, Fic1 deficient mice do not develop cholestasis, although bile salt homeostasis and excretion are disturbed when treated with hydrophobic bile salts. Therefore, the pathogenesis of FIC1
induced cholestasis remains unclear. Aim: To assess the effect of Fic1 deficiency on canalicular membrane structure and function and bile acid transporter expression. Methods: Fic1 was knocked down in primary rat hepatocytes maintained in a collagen sandwich culture system using adenoviral siRNAs for 4 days. Gene and protein expression were determined using realtime quantitative PCR (Q-PCR) and Western blot. Bsep and Mrp2 localization and activities were assessed using immunocytochemistry and CGamF and CMFDA excretion. Canalicular membrane structure was examined by electron microscopy (EM). Results: Adenoviral siRNA reduced Fic1 expression by 90% at both mRNA and protein levels. All virally infected preparations made cell contacts with well formed bile canaliculi. No significant differences were seen in the expression of Fxr, Bsep, Ostα, Oatp2, Mrp2, Mrp3, and Mrp4 at mRNA or protein levels. Immunofluorescent staining confirmed that Bsep and Mrp2 were localized to the canalicular membrane and EM images showed intact canalicular membrane structures in these cells when they were maintained in 5% bile acid free charcoal-stripped serum medium. In contrast, canalicular excretion of CGamF (a substrate of Bsep) was significantly reduced in Fic1 knockout cells compared with scrambled siRNA controls whereas CMFDA (an Mrp2 substrate) secretion was not significantly changed. However when hepatocytes were treated with 5µM CDCA for 24 hrs, blinded analysis of electron micrographs revealed that the canalicular membrane was disrupted in many Fic1 knockout cells, but not CDCA treated control cells. Conclusion: Fic1 knockdown hepatocytes maintain expression of bile salt transporters although bile salt excretion is reduced. However our findings indicate that Fic1 deficiency predisposes the canalicular membrane to injury by hydrophobic bile acids, explaining the development of PFIC.

226 PHENOTYPIC TRANSDIFFERENTIATION OF HEPATOCYTES TO BILIARY EPITHELIAL CELLS IN RAT LIVER AND IN HEPATOCYTE ORGANOID CULTURES: ROLE OF HGF AND EGF SIGNALING

Pallavi B. Limaye; 1Department of Pathology, School of Medicine, University of Pittsburgh, Pittsburgh, PA; 2Department of Biostatistics, Graduate School of Public Health, University of Pittsburgh, Pittsburgh, PA

Transdifferentiation of hepatocytes to biliary epithelial cells (BECs) has been speculated as a mechanism to restore the injured bile ducts in chronic biliary liver disease (CBLD). We have documented the actual occurrence of this event in vivo and in vitro in rodents. The present study is aimed at identifying the mechanisms of hepatobiliary transdifferentiation, using an experimental biliary injury model of F344 rats exposed to methylene dianiline (DAPM, 50 mg/kg). Hepatocyte to BEC transdifferentiation was indicated in this model by the periportal hepatocytic immunostaining of biliary specific cytokeratins AE1/AE3 and CK19. In chimeric rats carrying dipeptidyl peptidase IV (DPPIV)-positive hepatocytes (DPPIV) and treated with DAPM (50 mg/kg, single administration), one treatment did not elicit bile ductules bearing the donor hepatocyte marker DPPIV. Repeated administration, however, of DAPM (50 mg/kg, at 2 days interval, 3x) resulted in DPPIV positive bile ducts (~10%) producing a direct evidence for hepatocyte to BEC transdifferentiation. These findings indicate that hepatocyte to BEC transdifferentiation occurs only when biliary proliferation is impaired. To investigate the mechanisms of this transdifferentiation, an in vitro organoid culture of rat hepatocytes was utilized where hepatocyte-to-BEC transdifferentiation has been previously demonstrated. Growth factors known to be involved in differentiation including HGF, EGF, VEGF, PDGF, SCF, MSP, FGF-a, FGF-b, and FGF-8b were tested for their ability to promote hepatocyte transdifferentiation. Except HGF and EGF, none of the growth factors examined were able to induce formation of BEC despite the presence of their cognate receptors. Among the protein kinases common to HGF and EGF signaling including ERK1/2, p38, JNK, and AKT, Western blot analyses showed activation of only AKT in the HGF and EGF treated cultures showing biliary epithelium formation. Microarray analysis of the HGF- and EGF-treated organoid cultures indicated upregulation of ~500 genes including various ECM proteins, genes regulated by Wnt/beta-catenin, TGFbeta/BMP, and AKT pathways while downregulation of ~200 genes including GSTYb4, CYP1A1, CYP2D6, tumor suppressor protein p53 etc. Taken together, these data suggest that HGF and EGF signaling play a unique role in transdifferentiation of hepatocytes to BECs through specific set of target genes upregulated/downregulated revealed in the microarray analysis. These findings also provide a potential novel therapeutic approach of stimulating the native hepatocytes transdifferentiation to compensate for the lost biliary epithelium in CBLD patients.

227 TAUROLITHOCHOLIC ACID-INDUCED CHOLESTASIS IN RAT LIVER

Silvia Maizt1,2, Ralf Wimmer1, Christian Rust1, Gerald U. Denk1, Pietro Invernizzi2, Sacha Ferdinandusse2, Ronald J. Wanders2, Andrea Fuchsbieler4, Peter Ficker1, Michael Trauner4, Alan F. Hofmann3, Ulrich Beuers1,6; 1Medicine II-Grosshadern, University of Munich, Munich, Germany; 2Metabolic Diseases, University of Amsterdam, Amsterdam, Netherlands; 3Internal Medicine, University of Milan, Milan, Italy; 4Gastroenterology, University of Graz, Graz, Austria; 5Gastroenterology, University of San Diego, San Diego, CA; 6Gastroenterology&Hepatology, University of Amsterdam, Amsterdam, Netherlands

The impact of taurine conjugation for the anticholestatic effect of ursodeoxycholic acid (UDCA) and its taurine conjugate (TUDCA) is unclear (Nature CP Gastro Hepat 2006;3:318). Side chain shortened nor-ursodeoxycholic acid (norUDCA) exerts therapeutic effects superior to UDCA in Mdr2/Abcc4 knockout mice that develop chronic progressive sclerosing cholangitis (Gastroenterology 2006;130:465). In contrast to UDCA, norUDCA is poorly conjugated by rat and human hepatocytes (Hepatology 2005;42:1319). Taurolithocholic acid (TCA)-induced cholestasis represents a well-established experimental model of hepatocellular cholestasis. Preliminary studies suggested that UDCA, but not norUDCA, reverses TCA-induced cholestasis. Aim: To compare the effect of norUDCA and its taurine conjugate (TnorUDCA) on bile formation and liver cell injury in TCA-induced cholestasis. Methods: The effect of norUDCA and TnorUDCA (25µmol/l, each) on bile flow and biliary secretion of the Mrp2/Abcc2 substrate, 1,2-dinitrophenyl-S-glutathione (GS-DNP), was studied in presence or absence of TCA (10µmol/l) in isolated perfused rat livers (JBC 2003;278:17810). Bile acid administration was started after 45 min, and 1-chloro-2,4-dinitrobenzene (30µmol/l), the precursor of GS-DNP, was admin-
228 THE ROLE OF PPARγ IN BILE DUCT LIGATION-INDUCED HEPATIC INJURY IN RATS

Tomomi Kitagawa, Yukihiro Yokoyama, Toru Kawai, Kiyotaka Kawai, Katsutaka Watanabe, Masato Nagino; Department of Surgery, Division of Surgical Oncology, Nagoya University Graduate School of Medicine, Nagoya, Japan

Aims: Peroxisome proliferator-activated receptor (PPARγ) is ligand-activated intracellular transcription factors that have been implicated in important biological processes such as inflammatory response, lipogenesis, glucose uptake and vascular tone regulation. The liver injury in response to bile duct ligation (BDL) is related to enhanced inflammatory response and increased vasoconstrictor production. In this study, we sought to determine the effects of PPARγ modulation on BDL-induced hepatic injury. Materials and Methods: Rats were divided into four groups: sham operation with vehicle treatment; BDL with vehicle treatment; BDL with PPARγ antagonist (GW9662, 1mg/kg i.p.); BDL with PPARγ agonist (15d-PGJ2, 200µg/kg i.p.). Rats were sacrificed 24 hours thereafter. The plasma 15d-PGJ2 levels (PPARγ ligand) were measured by ELISA. Gene expression of inflammatory cytokines (IL-1β, IL-6, IL-12, IFN-γ and TNF-α) and vasoconstrictr-related genes (endothelin-1 and thromboxane A2 synthase) in the liver were determined by real-time RT-PCR. Serum levels of reactive oxygen species (ROS) were also measured. Results: 15d-PGJ2 levels were significantly increased in BDL rats. GW9662 increased, whereas 15d-PGJ2 decreased the gene expression of inflammatory cytokines such as IL-1β, IL-12, IFN-γ, and TNF-α (Figure). The expression of endothelin-1 and thromboxane A2 synthase were also showed a similar trend. Serum ROS levels did not show significant difference among the groups. Conclusion: These results indicated that the activation of PPARγ protect the liver against hepatic injury through the attenuated production of inflammatory cytokines and vasoconstrictors. PPARγ activation with 15d-PGJ2 might be a potent therapeutic option for hepatic injury in BDL rats.

229 TTR-ABCB11 MICE FED CHOLATE HAVE ATTENUATED INCREASES OF HEPATIC INTERLEUKIN-1β AND SERUM ALT, BUT INCREASED EXPRESSION OF APOPTOTIC PATHWAYS

Marc S. Elias, Lee-Amy Chang, Richard M. Green; Hepatology, Northwestern University, Chicago, IL

Background: TTR-Abcb11 transgenic mice overexpress the liver bile salt export pump (Abcb11) and hypersecrete bile salts into bile. Abcb11 expression increases with cholate feeding, and this may serve as a protective mechanism against cholate injury. The hydrophobic bile salt deoxycholic acid (DCA) is also a potent inducer of the Fas (CD95) and tumor necrosis factor-associated apoptosis-inducing ligand (TRAIL) apoptotic pathways. Aim: To determine if hepatic Abcb11 overexpression can attenuate hepatic cholate-induced injury. Methods: Male 8-12 week old TTR-Abcb11 and FVB/NJ (wt) mice were fed chow or a 0.5% cholate diet (w/w) for 3 days. The bile salt pool was analyzed using HPLC and serum ALT levels were measured spectrophotometrically. Hepatic interleukin 1β (IL-1β) levels were determined utilizing Meso Scale Discovery electrochemiluminescence and hepatic gene expression was determined using quantitative PCR. Data expressed as Mean±SD. Results: Cholate feeding expanded the bile salt pool (p<0.01) in TTR-Abcb11 (52±15 to 116±30 µmol/100g bw) and FVB/NJ (69±11 to 124±11 µmol/100g bw) mice. In contrast, TTR-Abcb11 mice fed cholate had a 2.9-fold greater concentration of taurodeoxycholic acid (TDCA) in their bile salt pool than FVB/NJ (13.6±4.3 vs 4.7±1.3 µmol/100g bw, p<0.01). Cholate feeding increased serum ALT levels in all mice, however, the increase in ALT levels was significantly lower in TTR-Abcb11 mice (p<0.03). Cholate feeding caused an increase in ALT levels from 26±10 to 96±33 U/L vs 28±9 to 187±67 U/L; in TTR-Abcb11 vs FVB/NJ mice, respectively. TTR-Abcb11 mice fed cholate did not have an increase in hepatic levels of the inflammatory cytokine IL-1β, however, hepatic IL-1β levels were markedly increased in cholate-fed FVB/NJ compared to chow fed mice (97±128 vs 37±18 pg/g liver, p<0.01). In contrast, analysis of apoptosis pathway genes demonstrated that TTR-Abcb11 mice fed cholate had a 4-fold greater increase in gene expression of Fas receptor, p<0.01; a 7.5-fold increase in Fas ligand, p<0.01; and a 2-fold increase in TRAIL-R2 (Receptor 2), p<0.05 compared to FVB/NJ mice fed cholate. There were no differences detected in TRAIL ligand, TNF-R1
MEDIATED REDUCTION OF HEPATIC NUCLEAR RXR

pathways are due to the increased levels of the taurine conju-
gated reduction of nuclear RXRα may help reduce cholate-
duced inflammation, while the activation of apoptotic
pathways are due to the increased levels of the taurine conju-
gate of the pro-apoptotic bile salt DCA.

230 REDUNDANT ROLES FOR JNK1 AND JNK2 IN IL-1β-
MEDIATED REDUCTION OF HEPATIC NUCLEAR RXRα IN VIVO

Astrid Kosters, Hongdan Sun, Sundararajah Thevananther, Saul J. Karpen; Pediatrics, Baylor College of Medicine, Houston, TX

Inflammation leads to suppression of many liver functions including bile flow. Previous work suggests that the cytokine Interleukin-1β (IL-1β) plays a central role in mediating inflammation-induced cholestasis. Multiple in vivo and in vitro studies indicate that a major mechanistic contribution to a decrease in hepatic gene expression by IL-1β is a targeted reduction in the functional activity of members of the nuclear receptor (NR) superfamily involved in directing the expression of critical hepatobiliary transporter genes. In HepG2 cells, IL-1β signaling induced nuclear export of Retinoic X Receptor alpha (RXRα), the heterodimeric partner of multiple NRs, which was dependent on JNK-mediated phosphorylation of Ser260. JNK1 and JNK2 isoforms play distinct roles in hepatocyte growth and apoptosis, yet individual roles for either isoform in mediating the effect of IL-1β on RXRα are unknown. In this study we explored the in vivo effects of IL-1β on hepatic NR-dependent gene expression, nuclear RXRα levels and roles for individual JNK isoforms. C57Bl/6 mice were given 0.5, 1, or 5 μg murine IL-1β or saline by i.p. injection. Livers were harvested after 1, 4, 8 or 16 hrs. Jnk1-/- and Jnk2-/- mice were given 5 μg IL-1β or saline 1 hr prior to harvest. Primary hepatocytes were treated with 10 ng/ml IL-1β for 15, 30, 45 and 60 min +/- 30 min pretreat-
mament with 30 μM of the JNK inhibitor SP600125. Gene expression was determined by TaqMan Real-Time PCR. RXRα, P-JNK1 and total JNK levels in nuclear and cytosolic fractions were analyzed by Western blot. In vivo, IL-1β treatment resulted in a dose and time-dependent induction of hepatic TNFα, IL-1β and IL-6 RNA levels while 5 μg IL-1β reduced the expression of the NR-dependent genes Ntcp, Cyp7a1, Cyp8b1, Abcg5, Mrp2, Mrp3, and Cyp3a11 in a time-dependent manner. Nuclear RXRα levels were reduced dose-dependently after 1 hr of IL-1β treatment, whereas equivalent JNK activation was seen at all doses. IL-1β treatment of primary hepatocytes reduced nuclear RXRα levels, which was prevented by pretreatment with a JNK inhibitor demonstrating direct involvement of JNK in IL-1β-mediated reduction of nuclear RXRα in hepatocytes. To determine which of the 2 JNK isoforms expressed in liver is involved, Jnk1-/- and Jnk2-/- mice were treated with 5 μg IL-1β for 1 hr. Absence of either JNK1 nor JNK2 significantly influenced the reduction of hepatic nuclear RXRα after IL-1β treatment. This suggests that for IL-1β mediated alterations in hepatic nuclear RXRα levels, functional redundancy exists for JNK1 and JNK2, stressing the importance of this pathway in mediating the hepatic response to inflammation.

231 ROLE OF CA2+-DEPENDENT PROTEIN KINASE C ISO-
FORMS IN ESTRADIOL 17β-D-GLUCURONIDE-INDUCED
CHELOSTASIS IN THE RAT

Fernando A. Crocenzi1,2, Enrique J. Sánchez Pozzi1, María L. Ruíz1, Andrés E. Zucchetti1, Marcelo G. Roma1, Aldo D. Mot-
tino1,2, Mary Vare2; 1Institute of Experimental Physiology, National University of Rosario, S2002URL-Rosario, Argentina; 2Graduate Center for Toxicology, University of Kentucky, Lexington, KY

The endogenous estradiol metabolite, estradiol 17β-D-glu-
curonide (E17G), induces an acute cholestasis in rat liver due in part to retrieval of the canalicular bile salt export pump (Bsep, Abcc11) and the multidrug resistance protein 2 (Mrp2, Abcc2), and the consequent loss of their function. Activation of the classical, Ca2+-dependent isoforms of protein kinase C (cPKC) has been shown to affect bile formation and normal transporter localization (J Biol Chem 279:10323). We evaluated the involvement of cPKC isoforms in E17G-induced changes in canalicular transporter function and localization.

Methods: The non-recirculating isolated perfused liver (IPL) from female rats was used to assess the effect of cPKC inhibition by Gö6976 (500 nM in perfusate) on changes in bile flow, total glutathione (GSH) and 3H-taurocholate (3H-TC) excretion induced by E17G. Bile was collected before and after 5 min after E17G (2 μmol, intraportal bolus dose) for 60 min. Liver samples were taken 20 min after E17G for localization of Bsep and Mrp2 by confocal immunofluorescence laser microscopy. Isolated hepatocytes were cultured for 5 h and exposed to E17G (50 μM) for 5-20 min. After subcellular fractionation, activation of the cPKC isoform, PKCcα, and the novel Ca2+-inde-
dependent PKC isoform, PKCc, were evaluated by western blot-
ing of cytosolic and total membrane fractions. Results: E17G induced an acute, significant (p<0.05 vs control) decrease in bile flow (61%) and biliary excretion of total GSH (62%) and [3H]-TC (79%). The selective cPKC isoform inhibitor Gö6976 partially protected against the decreases in bile flow (15%), total GSH (23%) and [3H]-TC (20%; p<0.05 vs E17G alone). In E17G-treated livers, both Bsep and Mrp2 demonstrated endocytic retrieval from the canalicular membrane; Gö6976 completely protected against E17G-induced retrieval measured by ImageJ (NIH) software analysis. In hepatocytes, E17G induced a 60% increase (p<0.05) in membrane-bound PKCc within 5 min, an indicator of PKC activation. This increase persisted for 15 min and returned to control values by 20 min. The proportion of PKCc associated with the membrane fraction was not modified by E17G. Conclusions: E17G selectively activ-
ates cPKC isoforms within minutes. Selective blockage of cPKC activation with Gö6976 completely prevented retrieval of Mrp2 and Bsep, and markedly protected against their loss of function. These findings support a central role for cPKC isoforms in E17G-induced cholestasis by a mechanism involving mainly transporter retrieval from the canalicular membrane.

340A AASLD ABSTRACTS HEPATOLOGY, October 2007
Background & Aim: Expression of hepatic organic anion transporters is decreased during inflammatory cholestasis. Down-regulation of the multispecific conjugate-exporter Mrp2 is mediated by interleukin-1β dependent signals (Geier et al. Hepatology 2003) but the underlying mechanism is still unclear. YB-1 is a predominantly cytoplasmic protein which translocates to the nucleus in response to various insults and has previously been characterized as a transcriptional repressor of rat Mrp2 (Geier et al. BBRC 2003). Consequently, we characterized the role of YB-1 as a suppressor of hepatic negative acute phase genes such as Mrp2. Materials & Methods: Male Sprague-Dawley rats were i.p. injected with 5 mg/kg LPS (1 μg/kg in saline) and livers were harvested after 20 hours. Liver tissue was fixed in 4% formalin and paraffin-embedded. 4 μm-thick sections were immunohistochemically stained with YB-1-specific antibodies. Liver RNA was reverse-transcribed and cDNA used as template in real-time PCR reactions with primers for Mrp2 and YB-1. The rat hepatoma cell line FAO was stimulated with LPS, IL-1β and TNFα. Nuclear and cytoplasmic protein extracts were prepared and YB-1 protein expression was quantified from Western Blotting analysis. A YFP-labelled YB-1 expression vector was transfected into cells, stimulated with IL-1β and visualized by confocal microscopy. Results: Mrp2 mRNA was downregulated to 18±20% in LPS-treated rats compared to untreated controls while YB-1 mRNA expression levels increased to 247±27%. Immunohistochemical staining showed strong up-regulation of YB-1 protein in endotoxemic livers. LPS-stimulation of FAO cells caused a moderate dose-dependent increase in nuclear as well as cytoplasmic protein after 8 to 16 hours. Furthermore, nuclear YB-1 protein transiently increased in a moderate fashion one hour after LPS-application. IL1β-stimulation of FAO cells resulted in a 5-fold upregulation of YB-1 in the nuclear compartment with a dose-dependent peak between 1.5 and 2 hours. Similarly, IL1β stimulation in YB-1-YFP-transfected cells showed an increase in nuclear fluorescence one hour post-treatment. TNFα did not affect YB-1 protein levels. Conclusions: YB-1 is activated during the hepatic acute phase response by two different mechanisms: a rapid nuclear shift within 2 hours mediated by interleukin-1β and a transcriptional induction during endotoxemia. This induction of YB-1 now explains the IL-1β mediated suppression of Mrp2 expression in endotoxemic rats. Moreover, YB-1 may serve as a central mediator of further regulatory events in inflammatory liver disease such as induction of other YB-1 target genes including MMP-2.

BACKGROUND & AIDS: Half of patients with HCV-2 and HCV-3 infection attained sustained virologic response (SVR) following Peg-interferon alfa-2a (Peg-IFN) monotherapy. However, guidelines recommend Peg-IFN with ribavirin for 24 weeks in all patients. Efforts to select patients who might benefit from Peg-IFN monotherapy have not been pursued. Methods: In a multicenter trial, 144 HCV-2 and HCV-3 patients were started on Peg-IFN alfa-2a (180 µg/week) and ribavirin (1000-1200 mg/day) for 12 weeks: those with RVR at week 4 were randomized to either discontinue ribavirin or remain on Peg-IFN alfa-2a, (n=59) or to continue combination therapy (n=61). To delineate patients' features that might help identify individuals likely to benefit from ribavirin discontinuation, an SVR prediction model was developed including gender, age, HCV genotype, baseline HCV-RNA levels, BMI, ALT values, and advanced fibrosis. Stepwise logistic regression analysis was used to compare P values and odds ratios for the effect of prognostic factors on either SVR and RVR rates. Results. In the 24 patients with no RVR, 15 (63%) were end-of-treatment (EOT) responders, and 12 (50%) were SVR. Baseline features of RVR patients randomized to ribavirin withdrawn or to standard treatment were not different. All but one RVR patients had EOT response. As expected, SVR rates were lower after discontinuation of ribavirin: 54% versus 82% (p<0.001). Twenty-seven (46%) and 10 (17%) EOT patients, respectively, relapsed during the follow up [difference (29%, CI 27.5-30.6; p<0.001). In the discontinuation group, low body weight (p=0.022), low BMI (p=0.034), low viremia (p<0.01) genotype 3 (p=0.031) and mild liver disease (p=0.01) were associated with SVR; in the multivariate analysis, low viremia and mild liver disease remained significant predictors with respective odds ratios of 56.8 (CI 1.4-3745) and 27.3 (CI 1.4-521). In patients who did or did not discontinue ribavirin, SVR rates were similar in those with <300,000 IU/ml viremia (86% vs. 81%) and in patients with intermediate viremia (70% vs. 71%), but disappointingly low in those with >700,000 IU/ml viremia (37% vs. 88%, p=0.004). Conclusions: in HCV-2 and HCV-3 patients, withdrawn of ribavirin and continuation with Peg-IFN alfa-2a monotherapy may be appropriate to attain SVR, providing viremia is cleared early during therapy and associated with low baseline viral load. Our investigation warrants future prospective testing, since it can give rise to considerable saving in cost and quality of life related to overtreatment.

Background: The impact of amantadine on virologic response of interferon-based treatment of chronic hepatitis C is controversial. Dose-dependent increase in HCV RNA decline was observed for amantadine during first weeks of interferon-based treatment. Objectives: Assessment of virologic response rates in patients with chronic HCV 1-infection treated with 400mg amantadine or placebo in combination with Peginterferon alfa-2a (40kD) and ribavirin for 48 weeks. Patients and Methods: Seven hundred and four previously untreated chronically HCV genotype 1-infected patients (mean age 46 ± 12 yrs.) received amantadine-sulphate (400 mg/day) (n=352) or placebo (n=352) in combination with 180 µg peginterferon alfa-2a once weekly and ribavirin (1000-1200 mg/day) for 48 weeks. End of treatment and sustained virologic response after a 24-week follow-up period were assessed by qualitative RT-PCR (Cobas Amplicor HCV, sensitivity 50 IU/mL). Results: Demographic and baseline virologic parameters were similar in both treatment groups. For 61 patients (9 %) liver cirrhosis or transition to liver cirrhosis were reported. No significant differences were observed between patients receiving amantadine or placebo regarding end of treatment and sustained virologic response, respectively. Intent-to-treat virologic response rates are given in the Table. On-treatment drop-out rate in the amantadine-group was significantly higher than in the placebo-group (32% vs. 23%; p=0.01). However, adverse events and laboratory abnormalities were similar between both groups and per-protocol analysis revealed similar virologic response rates in both treatment groups (52.8% vs. 54.5%). Conclusion: In this large placebo-controlled multicenter study, amantadine even at a dose of 400mg/day did not improve virologic response of antiviral treatment with peginterferon alfa-2a and ribavirin.

RITUXIMAB COMBINED WITH PEG-INTERFERON-RIBAVIRIN IN REFRACTORY HCV-ASSOCIATED CRYOGLOBULINEMIA VASCULITIS
David Saadoun, Mathieu Resche rigon, Damien Sene, Laurent Perard, Jean charles Piette, Patrice Cacoub; pitie salpetriere hospital, Paris, France
Background: Treatment of hepatitis C-related mixed cryoglobulinemia (HVC-MC) remains difficult and one-third of patients continue to have active disease while receiving anti-CD20 monoclonal antibody or antiviral therapy. Objective: To report the results of a prospective open study using rituximab combined with Peg-Interferon (IFN)α2b-ribavirin in HVC-MC vasculitis. Patients: Sixteen consecutive HCV-MC patients were treated with rituximab (intravenously weekly for 4 weeks) combined with Peg-IFNα2b-ribavirin (for 12 months). All patients had severe active disease which was resistant to previous combination antiviral therapy. Results: Fifteen patients (93.7%) showed rapid clinical improvement, 10 of whom (62.5%) were complete responders. Compared with clinical complete responders, the partial or non responders had a 3.6 times longer duration of vasculitis prior to therapy and a lower rate of early virologic response. Complete response was associated with a significant reduction of cryoglobulin, rheumatoid factor activity and HCV RNA and increased C4. Treatment was well tolerated with no infectious complications. Flare-up of psoriasis and worsening of peripheral neuropathy occurred in one patient each. Clinical relapse occurred in two patients, which was associated with the simultaneous reappearance of HCV RNA and cryoglobulin and an increase in the number of peripheral blood B-cells. Conclusion: Rituximab combined with Peg-IFNα2b-ribavirin may act synergistically and represents a safe and effective therapeutic option in severe HVC-MC. This therapeutic schedule should be considered as induction therapy for HVC-MC patients.

TWICE VS ONCE WEEKLY DOSING OF PEGINTERFERON ALFA 2A IN CHRONIC HCV GENOTYPE 1 INFECTION: ANALYSIS OF EARLY VIRAL KINETICS
Jordan J. Feld1, Glen A. Lutchman2, Rohit Loomba1, Apurva A. Modi1, Yaron Rotman, Pothu Raju Nagabhyru, Marc Ghany, Theo Heller1, Vanessa Haynes-Williams1, T. Jake Liang3, Avidan U. Neumann, Jay H. Hoofnagle
Background: Treatment outcomes in chronic hepatitis C are highly correlated with early viral kinetics. Pegylation of interferon greatly improved treatment responses and allowed for once weekly dosing. However viral kinetic data have shown that many patients receiving peginterferon weekly have a rebound in HCV RNA between doses. This may result in suboptimal viral inhibition and prolong time to clearance of viremia. Aim: To compare early viral kinetics between once and twice weekly dosing of peginterferon in patients with chronic HCV genotype 1. Methods: Consecutive patients with HCV genotype 1 were divided into 2 groups: Group A received peginterferon alfa 2a 180µg once weekly and weight-based ribavirin for 4 weeks and Group B received an initial 180µg dose of peginterferon followed by 90µg twice weekly plus ribavirin for 4 weeks. Both groups were then treated with peginterferon 180µg once weekly and ribavirin for an additional 44 weeks. HCV RNA was measured at 0, 12, 24, 48 and 72 hrs and at days 7, 9, 14, 21 and 28. Early viral kinetics and baseline characteristics were compared. Results: Patients in Group A (n=25) had similar baseline characteristics to those in Group B (n=22): sex (54% vs 62% male), race (71% vs 77% Caucasian) and HCV RNA level (6.2 vs 6.3 log IU/ml). The groups had similar first phase (day 0-3) kinetics (Group A 0.76 log vs Group B -0.10 log), but starting at day 3, HCV RNA levels diverged (Figure). Patients in Group B had a more rapid decline in HCV RNA from day 3 to 28, with a slope of -0.62 compared to -0.39 log/week in Group A (p=0.03). The overall reduction in viral load from day 0 to 28 was greater in Group B (3.1 vs 1.8 log, p=0.029) and this resulted in a lower mean HCV RNA at day 28 for the twice-weekly group (A 4.4 vs B 3.2 log IU/ml, p=0.03). 4 patients in Group B were HCV RNA negative by day 28 compared to 0 in Group A (p=0.049). Conclusions: Twice-weekly dosing of peginterferon alfa 2a improves early viral kinetics in HCV genotype 1 infection.

It is unclear whether hepatitis C virus (HCV) is eradicated in patients with chronic hepatitis C who achieve a sustained virological response [SVR]. In this study, HCV-RNA was measured in serum, and peripheral blood mononuclear cells (PBMCs) and a follow-up of anti-HCV antibodies were performed in patients with chronic hepatitis C who achieved an SVR. PATIENTS–METHODS: 215 patients with an SVR after a treatment with IFN alpha-2b or PEG-IFN alpha-2b+ribavirin (PEG-IFN 1.5µg/kg/week, plus ribavirin 800-1200 mg /day according to weight), were included in this study. HCV-RNA was tested: (1) in serum for all the 215 patients every year and at the time of PBMCs collection, (2) in PBMCs collected in 71
Preemptive treatment (PT) of HCV after liver transplantation (LT) is controversial due to the high morbidity, high cost and unclear efficacy. Methods and patients: 75 consecutive patients with chronic hepatitis C and SVR, evaluated up to 10 years after treatment cessation, none demonstrated late relapse. HCV-RNA was detectable, by a very sensitive assay (TMA), in PBMCs in 1 patient. HCV antibody titters showed a marked decrease. These results demonstrate a durable response to IFN alpha 2b or PEG-IFN alpha-2b+ribavirin and indicate that SVR is associated with HCV eradication.

PREEMPTIVE TREATMENT OF HCV AFTER LIVER TRANSPLANTATION IS UNJUSTIFIED EXCEPT FOR GENOTYPE 3A

Hadar J. Merhav1, Luis Mielles1, Misty Ottman1, Stephen Chris Pappas2, Rafael C. Botero2; 1Medicine, University of North Carolina, Chapel Hill, NC; 2Internal Medicine, University of Texas, Houston, TX

Background: Preemptive treatment (PT) of HCV after Liver Transplantation (LT) is controversial due to the high morbidity, high cost and unclear efficacy. Methods and patients: 75 consecutive HCV LT recipients were followed prospectively in a preemptive intent to treat protocol with pegylated interferon (PegIFN) and ribavirin (Rib) for 48 weeks. Viral load and protocol biopsies were followed in all treated patients. Preemptive treatment was defined as starting less than 180 days after LT and before the onset of histologically proven recurrent HCV (Grade 1 Stage 1). Viral genotype, pretreatment viral load, time to initiation of treatment, immunosuppression, rejection episodes and completion of treatment were analyzed for their effect on response. Results: Demographics: Pts. - n = 75. Age - 52±7. Sex - 50 m, 25 f. HCC - 23. Follow up - 27 ± 13 m. Actuarial Survival (patient and graft) - 1 year = 91 & 88%, 3 year = 84 & 81% Of 75 LT patients (pts.) with HCV 29 (39%) qualified for PT. 14 pts. were treated after HCV recurrence was histologically documented. 32 pts. (43%) received no treatment against HCV. Reasons for exclusion were: preoperative viral clearance - 9; early death - 3; psychosocial - 6; re-LT - 3; medical - 15; noncompliance - 5; early HCV recurrence - 3. Of the 29 who started PT only 13 (17 & 45%) completed treatment. Of the 29 on PT 17 had complete response, 11 end of treatment response and 6 sustained viral response (SVR). Of the patients with SVR non were genotype 1a (3-3a, 1-2b, 1-1b, 1- indeterminate). Of 5 pts. with genotype 3a in the PT group all cleared the virus with one recurrence. Of 15 pts. with advanced recurrence (Grade >1 stage > 1) 12 had genotype 1a. No pts. With genotype 1a achieved SVR. 2 pts. And 3 (4%) grafts were lost to recurrent HCV. Of 15 pts. with moderate to severe recurrent HCV (>Grade 1 Stage 1) 12 were 1a, 2 2a and 1 4e. After censuring for early death and early recurrent hepatitis there was no survival advantage in the non treated vs. the PT group. There were no deaths, graft loss or rejection episodes associated with treatment for HCV. 75% of PT patients required growth factor treatment. Intent to treat SVR was 6% for the cohort, 20% for the PT group and 45% for the pts. that completed treatment. Conclusions: 1. PT for HCV after LT is expensive, time consuming and associated with considerable (though not lethal) morbidity. With an SVR of 6% it appears to be unjustified to expose all HCV pts. to treatment. 2. Genotype 3a appears to respond favorably and consistently to treatment and may be an indication for PT.

ASSOCIATION BETWEEN GENE POLYMORPHISMS AND PSYCHIATRIC SYMPTOMS DURING PEGINTERFERON TREATMENT FOR CHRONIC HEPATITIS C

Donna Evon1, Kirk C. Wilhelmsen2-3, Darmendra Ramcharran4, Steven H. Belle4, Michael W. Fried1; 1Medicine, University of North Carolina, Chapel Hill, NC; 2Genetics, University of North Carolina, Chapel Hill, NC; 3Neurology, University of North Carolina, Chapel Hill, NC; 4Graduate School of Public Health, University of Pittsburgh, Pittsburgh, PA

Background: Psychiatric side effects (PSE), a common occurrence in patients undergoing peginterferon (IFN) therapy, can have adverse effects on patient and treatment outcomes. Risk factors for PSE are not well known. The inflammatory response system (IRS) and proinflammatory cytokines, such as IFN, can induce depression. Therefore, it is plausible that gene variants involved in the IRS and interferon-signaling pathways may be implicated in developing PSE. The current study sought to identify single nucleotide polymorphisms (SNPs) that are associated with the development of IFN-induced PSE. Methods: Participants in the Virahep-C study, a NIH-funded study of antiviral therapy for chronic hepatitis C, were treated with PegIFNα-2a and ribavirin for up to 48 weeks. Four measures of PSE, collected prospectively, were used to create a dichotomous variable. Data were available from 374 of 401 participants. Candidate genes for Virahep-C were selected a priori based on potential involvement in treatment response. SNPs representing the entire region of candidate genes were genotyped. 896 potential involvement in treatment response. SNPs representing the entire region of candidate genes were genotyped. 896 SNPs were analyzed. Statistical analysis: Associations between PSE and SNPs were tested using relative risk (RR) models using a modified Poisson regression approach (Zou 2004). RR mod-
RESULTS: Thirty-four patients were sustained virological response by real-time PCR. G3PDH and HMB were used as internal controls. USP18 (a specific remover of ISG15 from ISGylated protein), mRNA expressions of RIG-I, Cardif, MDA5, LGP2, ISG15, patients with non-viral liver disease. Pretreatment hepatic 1b treated with PEG-IFN alfa-2b plus RBV for 48 weeks and 5 positives in genetic association analyses. Results and Conclusions: Exploratory analyses revealed 7 SNPs significantly associated with IFN-induced PSE in CA. No statistically significant associations were found for AA. Each of the 7 SNPs had a false positive rate (q-value) below 0.50, suggesting that it is unlikely that all of the independent associations were false positives. Replication and a more systematic assessment of the implicated genes are needed to further define their role in the development of IFN-induced PSE.

241 GENE EXPRESSION OF CYTOPLASMIC VIRAL SENSORS AND REGULATORS INVOLVING INNATE IMMUNITY AND RESISTANCE TO PEG-INFERNBERON ALFA-2B PLUS RBAVIRIN TREATMENT IN CHRONIC HEPATITIS C

Yasuhiro Asahina, Namiki Izumi, Itsuko Hirayama, Mitsuaki Sato, Tomohiro Tanaka, Nobutoshi Komatsu, Naoki Umeda, Takanori Hosakawa, Ken Ueda, Hiroyuki Nakamishi, Kaoru Tsuchiya, Jun Itakura, Masayuki Kurosaki, Masakatsu Uchihara, Shozo Miyake; Gastroenterology and Hepatology, Musashino Red Cross Hospital, Tokyo, Japan

BACKGROUND: Mechanisms involving resistance to interferon (IFN) and ribavirin (RBV) have not been fully elucidated, and prediction of treatment responses before initiation of therapy is difficult. RIG-I and the related MDA5 initiate the host antiviral response by detecting intracellular viral dsRNA. Cardif (ISP-I, MAVS, VISA) is an adaptor molecule that connects RIG-I sensing to downstream signaling. On the other hand, LGP2, a helicase belonging to the RIG-I family, and E3 ubiquitin ligase have been shown to negatively regulate RIG-I sensing. Moreover, these molecules are ISGylated by ISG15, a ubiquitin-like protein. However, the clinical significance of these innate immune systems in terms of treatment response is unclear. AIM: To elucidate the mechanisms underlying resistance to PEG-IFN plus RBV, and to determine whether analysis of the innate immune system is useful in predicting treatment responses. METHODS: We studied 74 chronic hepatitis C virus (HCV) patients with genotype 1b treated with PEG-IFN alfa-2b plus RBV for 48 weeks and 5 patients with non-viral liver disease. Pretreatment hepatic mRNA expressions of RIG-I, Cardif, MDA5, LGP2, USP15, and OAS1 (a specific remover of ISG15 from ISGylated protein), and serum HCV dynamics during therapy were measured by real-time PCR. G3PDH and HMB were used as internal controls. RESULTS: Thirty-four patients were sustained virological responders (SVR), 24 were transient responders (TR), and 20 were non-virological responders (NVR). The hepatic levels of all transcripts except Cardif were 2- to 8-fold higher in HCV patients than non-HCV patients. RIG-I, MDA5, and LGP2 expression was significantly up-regulated in NVR compared with TR or SVR. Cardif expression negatively correlated with RIG-I expression and was significantly suppressed in NVR. The difference between NVR and SVR or TR in the RIG-I/Cardif expression ratio was pronounced (NVR/TR/SVR = 1.2/0.6/0.5 copies/control). Like RIG-I and MDA5, ISG15 and USP18 expression was significantly up-regulated in NVR (ISG15, NVR/TR/SVR = 0.8/0.4/0.2 copies/control; USP18, NVR/TR/SVR = 0.9/0.6/0.4 copies/control). The RIG-I/Cardif ratio and the expression of MDA5, ISG15, and USP18 significantly correlated with viral decline rates in the first and second phases of HCV dynamics. Multivariate and ROC analyses revealed that a higher ratio of RIG-I/Cardif and a higher expression of MDA5, ISG15, and USP18 predicted NVR. CONCLUSION: Intracellular sensors and their regulators were variously up-regulated upon HCV infection especially in NVR. Quantifying hepatic gene expression involving an innate immune system is of use in identifying patients who are at a higher risk for NVR.

242 LIVER GENE EXPRESSION SIGNATURE TO PREDICT RESPONSE TO PEGYLATED INTERFERON PLUS RIBAVIRIN COMBINATION THERAPY IN PATIENTS WITH CHRONIC HEPATITIS C

Tarik Asselah 1, Ivan Bièche 2, Stéphanie Narguèr 2, Audrey Sabbagh 2, Ingrid Laurendeau 2, Marie-Pierre Ripault 2, Nathalie Boyer 1, Michelle Martinot-Peilgoux 1, Dominique Valla 1, Michel Vidaud 2, Patrick Marcellin 1; 1Liver Unit, Hôpital Beaujon, Clichy, France; 2INSERM U745, Paris, France

Background and Aims The gold standard treatment of chronic hepatitis C is the combination of pegylated interferon plus ribavirin. Considering side effects and treatment cost, prediction of treatment response is important. The aim of our study was to identify a liver gene signature to predict sustained virological response in patients with chronic hepatitis C. Patients and Methods Pretreatment liver biopsies from sixty nine naïve patients with chronic hepatitis C who were subsequently treated (same complete treatment of PEG-IFN alpha-2b with ribavirin) and for whom treatment responses were known were used for the study. Group A (training set): 40 patients with chronic hepatitis C including 14 non responders and 26 sustained responders. Group B (validation set) independent validation set of 29 patients including 9 non responders and 20 sustained responders. We selected 58 genes from the literature, associated with liver gene expression dysregulation during chronic hepatitis C. We used real-time quantitative RTPCR assays to analyse the mRNA expression of these 58 selected genes in these 69 liver specimens obtained before treatment. Results Many of the genes founded differentially expressed between SVR and NVR in both the training and the validation set (IFI6, IFI27, ISG15, OAS2, IFIT1) belong to IFN-inducible genes. Interestingly, all these genes were up-regulated in SVR and NVR samples in comparison with normal liver. From the Group A data, we identified three genes whose expression differed significantly between non responders and sustained responders: IFI6, G1P3, IFI27 and ISG15/G1P2. These three genes also showed significant
differences in their expression profiles between non responders and responders in the independent sample (Group B). The best classification results from group A were obtained using a twogene (IFI27 and CXCL9) signature, which accurately predicted treatment response for 23 of 29 patients (79.3%) of the validation set (Group B). Conclusion Our study has demonstrated that NR and SVR have prior to treatment, different gene expression patterns. The most notable changes in gene expression were mainly observed in the interferon stimulating genes. We used two independent groups of patients (training set and validation set) and we could predict treatment response with a two-gene signature (IFI27 and CXCL9). These genes code molecules secreted in the serum and provide a logical functional approach for the development of serum markers to predict response to treatment. Gene signatures will probably be used in the future for optimised and tailored treatment.

243
POSITIVE IMPACT OF ANTIVIRAL THERAPY ON THE LONG TERM OUTCOME OF CHRONIC HEPATITIS C PATIENTS WITH CIRRHOSIS
Ana C. Cardoso1,2, Rami Moucari1,2, Nathalie Boyer1, Tarik Asselah1, Asma Laatari1, Marie-Pierre Ripault1, Michele Martinot-Peignoux2, Sarah Maylin1,4, Pierre Bedossa1, Patrick Marcellin1; 1Hepatologie, Hopital Beaujon, Clichy La Garenne, France; 2Microbiologie, Hopital Beaujon, Clichy La Garenne, France; 3Inserm CRB3, Hopital Beaujon, Clichy La Garenne, France; 4Anatomie Pathologique, Hopital Beaujon, Clichy La Garenne, France; 5Medecine, Hopital Beaujon, Clichy La Garenne, France; 6Pharmacologie, Hopital Beaujon, Clichy La Garenne, France; 7Pharmacologie, Hopital Beaujon, Clichy La Garenne, France; 8Microbiologie, Hopital Beaujon, Clichy La Garenne, France

Background and Aim The major consequence of chronic hepatitis C (CHC) is the progression to cirrhosis and its potential complications: haemorrhage, ascites and hepatocellular carcinoma (HCC). The influence of antiviral therapy on the long-term outcome of CHC has not been determined. The aim of this study was to evaluate the influence of antiviral therapy on the long-term outcome of CHC patients with bridging fibrosis or cirrhosis. Patients and Methods 244 consecutive patients with CHC and bridging fibrosis or cirrhosis (METAIVIR F3-F4) were retrospectively evaluated. They had all received at least one treatment course with interferon (conventional or pegylated) with or without ribavirin for at least 12 weeks. Sustained virological response (SVR) was defined as undetectable HCV RNA in serum 24 weeks after treatment discontinuation. Cumulative incidence of haemorrhage, ascites, and HCC were compared between patients who developed or not SVR. The influence of treatment response on histology was also assessed on paired-liver biopsies in 64 patients. Results The baseline characteristics of the study population were: male gender (68%), mean age (55±10 years), mean BMI (26±5 kg/m²). Mean serum HCV RNA level was 1.08±1.34 10^6 IU/ml. Genotype distribution was: 1 (60%), 2 (19%), 3 (16%), 4 (14%). Median follow-up period was 5 years (1-18) after the first biopsy, and 2 years after the last treatment (1-15). SVR developed in 34% of patients. SVR was more frequent in patients with bridging fibrosis (F3) than in those with cirrhosis (F4) (44% vs. 21%, p<0.001), and in patients with genotypes 2 or 3 than in those with genotypes 1 or 4 (56% vs. 23%, p<0.001). SVR was not associated with age, BMI, serum HCV RNA level, liver necroinflammation or steatosis. Patients without SVR developed more frequently complications of cirrhosis than those who achieved SVR: haemorrhage (7% vs. 1%, p=0.05), ascites (21% vs. 5%, p=0.005). HCC developed in 22 patients; among them HCC developed in four patients 1 to 4 years after therapy despite SVR. Cumulative incidence of HCC was higher in patients who failed treatment (p=0.06). 64 patients had paired-liver biopsies. The second biopsy was performed after a median period of 2 years (1-15) following treatment discontinuation. Histological analysis showed a decrease of at least one point of the fibrosis score (METAIVIR) in 41% of patients as compared with 11% of those without SVR (p=0.005). Conclusion In CHC patients with bridging fibrosis (F3) or cirrhosis (F4), antiviral therapy is associated with significant regression of fibrosis and long-term improved outcome with lower rates of complications of cirrhosis and HCC.

244
LONG-TERM PROGNOSIS OF ELDERLY PATIENTS WITH HEPATITIS C VIRUS-RELATED CHRONIC LIVER DISEASE — A COHORT STUDY OF 2,379 JAPANESE PATIENTS
Kenji Ikeda, Yasuji Arase, Yusuke Kawamura, Hiromi Yatsui, Hitomi Sezaki, Tetsuya Hosako, Norio Akuta, Masahiro Kobayashi, Satoshi Saitoh, Fumitaka Suzuki, Yoshiyuki Suzuki, Hirokatsu Kumada, Hepatology, Toranomon Hospital, Tokyo, Japan

Background: Interferon therapy is effective in reducing hepatocarcinogenesis and in improving survival rate of patients with HCV-related chronic hepatitis, but the clinical influence of interferon is considered less advantageous in elderly patients because of short longevity. In order to elucidate the prognosis of elderly patients of 60 years or older, and to evaluate the advantage of interferon treatment in the elderly, we analyzed a large cohort of patients with chronic hepatitis type C from viewpoints of hepatocellular carcinogenesis and survival period. Patients and Method: Among 7,235 patients with hepatitis C virus related chronic liver disease in our hospital, prognosis of 2,379 elderly patients was analyzed. A total of 459 elderly patients began interferon therapy before development of liver cancer. The elderly cohort was observed for a median of 6.3 years (25% 2.6 years, 75% 10.8 years). Results: (1) Cumulative survival rates in untreated elderly patients without overt cirrhosis were 94% at the end of 10th year and 79% at the 15th year in high platelet (≥150,000/mm³) group, 87% and 73% in intermediate (100,000-149,000/mm³) group, and 71% and 36% in low platelet group (<100,000/mm³), respectively. (2) Fifth- and 10th-year hepatocarcinogenesis rates in the intermediate and low platelet group (<150,000/mm³) were 12% and 22% in interferon therapy group (N=85) and 19% and 43% in untreated group (N=474), respectively (P=0.028). Multivariate analysis disclosed that interferon independently decreased carcinogenesis risk with a hazard ratio of 0.53 (P=0.012) in the subgroups. In the high platelet group (≥150,000/mm³), on the contrary, 5th and 10th-year carcinogenesis rates were 3% and 9% in interferon-treated group (N=96), and 5% and 13% in untreated group (N=598), respectively (P=0.88). (3) Interferon treatment significantly increased cumulative survival rates in the subgroup of lower platelet group (P=0.0028), but did not affect in the subgroups of higher platelet (P=0.20). Multivariate analysis also showed interferon was significantly associated with a longer survival in the lower platelet subgroup (hazard ratio 2.44, P=0.011). Conclusion: Initial platelet count was significantly associated the survival time of the elderly patients with chronic hepatitis C.

HEPATITIS C VIRUS-RELATED CHRONIC LIVER DISEASE
Kumada; Hepatology, Toranomon Hospital, Tokyo, Japan
Interferon for a subgroup of intermediate and low platelet count had significant advantages from the viewpoints of hepatocarcinogenesis and survival.

245
EFFICACY AND SAFETY OF ESCITALOPRAM FOR THE PREVENTION OF DEPRESSIVE EPISODES INDUCED BY PEG-INTERFERON ALPHa2A AND RIBAVIRIN IN CHRONIC HEPATITIS C PATIENTS. A DOUBLE-BLIND, RANDOMIZED, PLACEBO-CONTROLLED TRIAL

Crisanto Diez-Quevedo1, Ramon Planas2, Pere Castellvi3, Rosa M. Morillas3, Maria Dolores Gimenez3, Helena Masnou2, Ricard Solà3, Pilar Giner1, Rocío Martín-Santos3,1Psychiatry, Hospital Germans Trias i Pujol, Badalona, Spain; 2Gastroenterology, Hospital Germans Trias i Pujol, Badalona, Spain; 3Hepatology, Hospital del Mar, Barcelona, Spain; 4Hospital Pharmacy, Hospital Germans Trias i Pujol, Badalona, Spain; 5Psychiatry, Hospital del Mar, Barcelona, Spain

Interferon is associated with a high prevalence of major depression, which is one of the main reasons for treatment withdrawal and failure. The aim of this study was to determine the efficacy and safety of an antidepressant for preventing depression induced by pegylated interferon ( PegIFN) alpa2a in chronic hepatitis C (CHC). Method: Multicenter double-blind study of CHC patients who were eligible for PegIFN-alpha2a and ribavirin (RBV) therapy. Patients with mental disorders at baseline were excluded. They were randomly assigned to receive the antidepressant escitalopram (15 mg/day) or placebo. Treatment was begun 2 weeks before PegIFN therapy and continued for the following 12 weeks. Main variables studied were the presence of a major depressive episode, according to DSM-IV diagnostic criteria, and scores on the Montgomery-Asberg Depression Rating Scale (MADRS) and the Hospital Anxiety and Depression Scale (HADS). The study protocol conformed to the guidelines of the Declaration of Helsinki and was approved by the Ethics's Committees of all centers involved and the Spanish Agency of Medicines. All patients signed a written informed consent before entering the study. Results: A total of 133 patients were included (74% genotype 1), 67 treated with escitalopram and 66 with placebo. Eighty-three (62%) patients were male, mean age 45.5 years. Seventeen patients (13%) had a past history of major depression and 22 (17%) of substance abuse. Placebo and escitalopram groups did not differ significantly in any measure at baseline. During the first 12 weeks of treatment, only 1 patient (2%) in the placebo group and 78% in the escitalopram group. Figures for the depression subscale of the HADS were 0.7 and 1.0 respectively. Differences between both groups were not statistically significant. Biochemical response at week 12 (normalization of transaminases) was achieved in 67% of patients in the placebo group and 78% in the escitalopram group. Virological response at week 12 (negativization of RNA-HCV) was obtained in 80% and 66% respectively. Conclusions: In CHC patients, pretreatment with an antidepressant is not an effective strategy for reducing depression induced by PegIFN and RBV, at least in a population of patients with low psychiatric risk. On the other hand, the use of escitalopram in CHC patients is safe regarding biochemical and virological response to treatment at week 12. This study has been supported by a grant from Roche Farma.

246
RESPONSE TO PEGINTERFERON ALFA-2B + RIBAVIRIN COMBINATION THERAPY IN GENOTYPE 2 AND 3 PATIENTS WITH POOR BASELINE PROGNOSTIC FACTORS: RESULTS OF THE CANADIAN POWER PROGRAM

Robert J. Bailey1, David K. Wong2, Curtis Cooper2, Nir Hilzenrat3, Kevork Pellekian2, Jeff Daiter2, Nabil Abadir4, Paul Marotta5,1Royal Alexandra Hospital, Edmonton, AB, Canada; 2Toronto Western Hospital, Toronto, ON, Canada; 3Ottawa Hospital General Campus, Ottawa, ON, Canada; 4Jewish General Hospital, Montreal, QC, Canada; 5Queens Health Sciences Centre, Halifax, NS, Canada; 6Ontario Addiction Treatment Centers, Richmond Hill, ON, Canada; 7Schering-Plough Canada Inc, Pointe Claire, QC, Canada; 8London Health Sciences Centre, London, ON, Canada

Background: This subanalysis of the POWer study evaluated the effect of fibrosis and baseline viral load on sustained virologic response (SVR) rates in treatment-naive genotype 2 (G2) and G3 patients with chronic hepatitis C treated with weight-based peginterferon (PEG-IFN) alfa-2b and weight-based ribavirin (RBV). Methods: POWer is an open-label observational trial conducted in community and academic clinics across Canada between 2002 and 2006. G2/G3 patients received PEG-IFN alfa-2b (1.5µg/kg/wk) plus RBV (800–1200mg/d) for 24 weeks. SVR was undetectable HCV RNA levels 24 weeks posttreatment. Results: 276 G2 and 389 G3 patients enrolled in POWer (38% of all patients). Baseline viral load and fibrosis scores were available in 72% and 37% of G2 and G3 patients, respectively. Numerically, more G3 than G2 patients had high viral load (HVL; 49% vs 44%) and advanced fibrosis/cirrhosis (F3-F4) (40% vs 33%). G3 patients had lower SVR rates than G2 patients (72% vs 79%, P=0.04) due to a lower end-of-treatment response (77% vs 86%, P=0.01); relapse rates were identical (7%). G2 patients responded well regardless of baseline viral load and fibrosis score (Table). G3 patients with low viral load (LVL) attained SVR more often than those with HVL (76% vs 65%, P=0.03). An inverse relationship between SVR and fibrosis score was observed in G3 patients; <50% of G3 cirrhotic patients attained SVR. Conclusions: G2/G3 patients respond very differently to combination PEG-IFN alfa-2b plus RBV therapy. G2 patients respond well regardless of baseline characteristics. Conversely, lower response rates are observed in G3 patients who have poor prognostic factors. The lower response rate in the G3 population after 24 weeks’ treatment may not be detected in smaller studies that combine G2/3 patients for analysis purposes. New treatment strategies such as increased dose or duration of treatment are needed for G3 cirrhotic patients. Future studies should avoid combining G2/3 patient populations when reporting results.

247 CHANGES IN ANTRODUODENAL MOTILITY DURING INTERFERON TREATMENT FOR CHRONIC HEPATITIS C

Keiko Korenaga<sup>1</sup>, Hiromi Suenaga<sup>2</sup>, Masaaki Korenaga<sup>1</sup>, Isao Sakaida<sup>1</sup> <sup>1</sup>Gastroenterology and Hepatology, Yamaguchi University Graduate School of Medicine, Ube, Japan; <sup>2</sup>Health Sciences, Yamaguchi University Graduate School of Medicine, Ube, Japan

Objective: In the majority of the patients treated with interferon (IFN) for chronic hepatitis C, weight loss accompanying loss of appetite is observed which greatly affects their quality of life (QOL) during the treatment. However, the mechanism of appetite loss due to IFN treatment is still unknown. The subjects of this study were patients with chronic hepatitis C who were undergoing IFN treatment. We quantitatively evaluated the antroduodenal motility in these patients using ultrasound examination and the relationship between the IFN treatment and appetite loss. Method: The subjects were 13 patients who were receiving a combination treatment of PEGIFN-α2b and ribavirin. During IFN treatment, we evaluated gastric emptying, antral motility and duodenogastric reflux by ultrasonography after liquid test meals. Digestive symptom scores and the changes in body weights were recorded. Results: The gastric emptying rate was significantly decreased posttreatment compared with pretreatment [percentage change 12 weeks after initiation of IFN therapy: -29.60±21.26%]. The frequency and intensity of antral contractions were decreased posttreatment. Duodenogastric reflux was seen significantly more frequently posttreatment. The digestive symptom score was significantly increased posttreatment, and the body weight was decreased. There was a positive correlation between the percentage change of the gastric emptying rate and weight loss (r=0.749, p=0.021). We examined 9 chronic hepatitis C patients undergoing IFN treatment, matching their ages and IFN/ribavirin doses. To these patients, we administered the gastric prokinetic agent nizatidine 150 mg BID (nizatidine group) in addition to the IFN treatment, and we compared this group with the group without nizatidine (non-nizatidine group). The gastric emptying rate 12 weeks after the IFN treatment was significantly higher for the nizatidine group compared with the non-nizatidine group (percentage change: nizatidine group:+10.49±10.63% and non-nizatidine group: -29.60±21.26%, p<0.005). The posttreatment rate of weight loss was less in the nizatidine group compared with the non-nizatidine group. The posttreatment increase in the digestive symptom score was significantly less in the nizatidine group compared with the non-nizatidine group. Conclusion: The loss of appetite and weight loss due to IFN treatment is not simply from subjective symptoms. Rather, it was confirmed that such symptoms are caused by the decline in antroduodenal motility. This study suggested that combining a gastric prokinetic agent with IFN treatment can result in weight loss suppression and improvement in QOL during treatment.

248 VACCINATION WITH HCV MRNA TRANSECTED DENDRITIC CELLS IN HCV TRIMERA MICE

Nina Blust, Reddy Vuyyuru, Fareed Rahman, Peter R. Galle, Wulf Bocher; Department of Internal Medicine, Mainz University, Mainz, Germany

Introduction: Spontaneous resolution from hepatitis C is associated with broad HCV specific CTL and Th cell responses. In contrast, viral persistence occurs in the presence of dysfunctional immune responses. Thus, stimulation of sufficient HCV-specific T cell reactivities might represent a new therapeutic strategy. We have shown previously effective T cell stimulation in the humanized HCV trimera mouse model by peptide or virus like particle vaccination (AASLD 2005). We now aimed to enhance CTL and Th cell stimulation by vaccination with autologous dendritic cells (DC). Methods: DC were generated from separated blood monocytes by incubation in IL-4 and GM-CSF. After 2 days, DC were transfected with mRNA encoding for the HCV derived proteins NS3, NS5b or EGFP. Lethally irradiated Balb/c mice, reconstituted with ncd.scid mouse bone marrow, were transplanted with human PBMC from HLA A2 positive recovered or chronic HCV carriers. Vaccination of such trimera was performed i.p. with HCV- or mock-transfected DC or synthetic nonapeptides representing well known HLA A2 restricted NS3 or NS5b derived CTL epitopes; vaccination with tetanus toxoid and EBV peptide 280-288 served as controls. HCV-, TT- and EBV-specific human T cell frequencies were analysed 10 days after vaccination from peritoneal lavage by tetramer analysis or IFNg ELISPOT with autologous APC pulsed with recombinant antigens, overlapping 15-mer peptides or nonapeptides. Results: Strong NS3 specific CTL responses were stimulated by vaccination with NS3- but not with NS5b- or mock-transfected DC in trimera mice implanted with PBMC from two different recovered chronic HCV carriers (after successfull treatment). In contrast, NS5b transfected DC were rather inefficient in T cell stimulation. Results in chronic HCV carriers and testing different RNA constructs will be presented at the meeting. Conclusions: Our studies demonstrate that HCV specific CTL, that are barely detected in donor PBMC, can effectively be expanded in vivo by vaccination with mRNA transfected DC. This approach might lead to new therapeutic vaccination strategies.

PRETREATMENT INSULIN SENSITIVITY CONTRIBUTES TO THE TREATMENT RESPONSE TO PEGINTERFERON PLUS RIBAVIRIN COMBINATION THERAPY FOR PATIENTS WITH CHRONIC HEPATITIS C

Jee-Fu Huang1,2, Ming-Lung Yu2, Chia-Yen Dai2, Ming-Yen Hsieh2, Li-Po Lee2, Zu-Yau Lin2, Shinn-Chern Chen2, Wen-Yu Chang2, Wan-Long Chuang2; 1Dept of Int Med, Kaohsiung Municipal Hsiao-Kang Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan; 2Hepatobiliary Division, Department of Internal Medicine, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan

Insulin resistance plays a key role in the entire suite of glucose abnormalities. The impact of insulin resistance on the treatment response of pegylated interferon-alpha plus ribavirin has not been fully clarified. This study aimed to evaluate the role of insulin sensitivity and the related viral factors in the treatment response in patients with HCV infection in Taiwan. Methods: A total of 430 patients (243 males) were included. All patients were treated with 24-week course of peginterferon alpha-2a (180 µg/week) and weight-based ribavirin 1000-1200 mg/day, with a 24-week follow-up period. We assessed insulin sensitivity and beta-cell function of these patients in a fasting state (homeostasis model assessment of insulin resistance [HOMA-IR] and homeostasis model assessment of beta-cell function [HOMA-beta]) before treatment and 24 weeks after treatment. Results: Sustained virological response (SVR) were observed in 336/430 (78.1%) patients. The rates of SVR in genotype-1 and non-1 patients was 64.5% (118/183) and 88.3% (218/247), respectively. The baseline HOMA-IR of those patients achieving an SVR was significantly lower than that of those without [2.28 vs. 3.40, P=0.002]. Multivariate logistic regression analysis demonstrated that high baseline HOMA-IR (>2.5) was a significant negative factor regarding SVR in all patients (OR=2.91, 95% CI= 1.38-6.58, P=0.006). For 172 non-diabetic patients with genotype-1 HCV infection, the SVR rate (49.0%, 25/51) of those with high baseline HOMA-IR was significantly lower than that of those without (<2.5, 87/121, P=0.004). Meanwhile, multivariate logistic regression analysis demonstrated that high baseline HOMA-IR (>2.5) was a significant negative factor regarding SVR in genotype-1 patients (OR=2.91, 95% CI= 1.38-6.58, P=0.006), followed by viral load and age. Conclusions: Pretreatment insulin sensitivity contributes to treatment response in chronic hepatitis C patients, especially for those with genotype-1 infection.

Correlation between pretreatment HOMA-IR and SVR in non-diabetic chronic hepatitis C patients receiving peginterferon plus ribavirin

RESPONSE TO HIGH RIBAVIRIN DOSE IN COMBINATION WITH PEG-INF ALFA-2A FOR TREATMENT OF HCV GENOTYPE 1 PREVIOUS NON-RESPONDERS

Erika Hornfeldt, Lars Stahle, Robert Schwarz, Ola R. Weiland, Tony Carlsson, Anna Hollander, Karin Lindahl, Department of Medicine, Division of Infectious Diseases, Karolinska Institute, Karolinska University Hospital, Stockholm, Sweden; Department of Clinical Pharmacology, Karolinska Institute, Karolinska University Hospital, Stockholm, Sweden.

BACKGROUND: Patients with hepatitis C (HCV) genotype 1 and previous non-responders to treatment with pegylated interferon (peg-INF) and ribavirin (RBV) are a difficult-to-cure group. We have previously shown that high doses of RBV (mean 2550 mg/d) offered high sustained virological response (SVR) in treatment-naive patients with hepatitis C genotype 1. The aim of this controlled study was to evaluate the efficacy, safety and tolerability of high doses of RBV in combination with standard-dosed peg-INF in previous non-responders. METHODS: 10 patients with HCV genotype 1 and previous non-responders to peg-INF alfa-2a and RBV therapy received treatment with individualized high dose of RBV in combination with peg-INF alfa-2a 180mg/week for 48 weeks. Non-responders were defined as not achieving HCV-RNA <50 IU/mL at any time during previous treatment. The initial RBV dose was individualized and calculated from a pharmacokinetic formula based mainly on renal function aiming at a high steady state concentration of RBV of >15 mmol/L. Plasma RBV concentrations were measured during treatment by HPLC and if necessary the RBV dose was adjusted to reach the target concentration. All patients received erythropoietin (epo) at doses 10,000-60,000 IU, once weekly, starting 2 weeks prior to initiation of antiviral treatment. RESULTS: We enrolled 10 patients, mean age 52 years and 7 of 10 with fibrosis stage 3 on a 4-grade scale. The mean initial RBV dose was 2400 mg/d (range 1600-2800). To reach the target concentration within 6 weeks the dose was raised to a mean RBV dose of 3000 mg/d (range 2400-4000). The mean baseline haemoglobin level was 15.3 g/dL, at treatment week 6 mean haemoglobin level was 13.4 g/dL and at week twelve 10.9 g/dL. Two patients have required blood transfusions. Mean baseline viral load was 7.4 ± 106 IU/mL, at treatment week 12 median viral load dropped to 1400 IU/mL (mean drop 3.6 log). Five patients have reached treatment week 24 of whom 4 have HCV-RNA <15 IU/mL (COBAS TaqMan). Of the remaining 5 patients, 4 have reached treatment week 16 whereof 2 have HCV-RNA <15 IU/mL. There are no therapy discontinuations. CONCLUSION: High-dosed RBV in combination with peg-INF alfa-2a seems to offer a mean 3.6 log HCV-RNA decline within 12 weeks in previous non-responders to standard-dosed combination therapy with the same drugs. High-dosed RBV treatment is feasible and seems to be safe, but requires strict attention regarding anaemia. Epo probably contributes to tolerability, especially during the first 12 weeks. The initial virological response is encouraging and the results from the completed trial, including SVR will show if the response is sustained.

SEQUENCE VARIATION OF INTERFERON/RIBAVIRIN RESISTANCE-DETERMINING REGION (IRRDR) OF HCV NSSA IS A PREDICTIVE MARKER FOR SUSTAINED VIROLOGICAL RESPONSE UPON COMBINATION THERAPY WITH PEGYLATED INTERFERON AND RIBAVIRIN

Hak Hotta, Ahmed El-Shamy, Mikiko Sasayama, Motoko Nagano-Fujii, Susumu Imoto, Noriko Sasase, Soo-Ryang Kim, Division of Microbiology, Kobe University Graduate School of Medicine, Kobe, Japan; Department of Gastroenterology, Kobe Asahi Hospital, Kobe, Japan.

Background and Aim: The combination therapy using pegylated interferon and ribavirin (Peg-IFN/RBV) has been considered to be most effective in treating patients chronically infected with hepatitis C virus (HCV). However, a substantial proportion of HCV-1b-infected patients still do not respond to Peg-IFN/RBV. The aim of this study is to explore a predictive marker(s) for sustained virological responders (SVR) and/or Non-SVR (non-responders) who never cleared the virus at any time point during the observation period, and the relapers who once cleared the virus but relapsed later upon Peg-IFN/RBV combination therapy. Methods: A total of 45 patients chronically infected with HCV-1b were treated with Peg-IFN-α-2b (1.5 µg per kg body weight, once weekly, sc) and RBV (600–800 mg daily, per os), according to a standard treatment protocol for Japanese patients established by a hepatitis study group of the Ministry of Health, Labour and Welfare, Japan. NSSA sequences of HCV-1b in the pre-treated sera were determined and compared with a consensus sequence. HCV RNA and core antigen titers in the sera were quantitatively measured before, during and six months after the treatment. Results: The mean number of mutations in the V3 region plus its upstream flanking region, which we refer to as IFN/RBV resistance-determining region (IRRDR) (aa.2334–2379), was significantly larger for SVR (6.1 ± 2.1) than Non-SVR (3.9 ± 1.4) (P<0.001) or NR (3.7 ± 0.9) (P<0.001). The criterion of ≥6 mutations in IRRDR (IRRDR≥6) was closely associated with IFN/RBV responsiveness. Only 2 (8%) of 24 Non-SVR had HCV with IRRDR≥6 whereas 16 (76%) of 21 SVR did (P<0.00001). Among the 24 Non-SVR, 13 patients were relapers. IRRDR≥6 could differentiate even between SVR and the relapers since only 2 (15%) of the 13 relapers had IRRDR≥6 (P<0.001). Moreover, all of 16 patients with IRRDR≥6 showed a significant (≥1 log) reduction of HCV core antigen titers within 24 h after the initiation of Peg-IFN/RBV whereas 10 of 17 patients with IRRDR<6 did (P<0.0001), with the result suggesting that IRRDR≥6 is closely associated with rapid reduction of HCV titers after the initiation of the therapy. The positive predictive value of IRRDR≥6 for SVR was 89% (16/18) (P<0.001) while the negative predictive value was 82% (22/27) (P<0.001). On the other hand, the number of mutations in the IFN sensitivity-determining region (ISDR) of NSSA was not a good marker to predict SVR, Non-SVR or NR in our study. Conclusion: A high degree (≥6) of sequence variation in IRRDR of HCV NSSA would be a useful predictive marker for SVR upon Peg-IFN/RBV combination therapy.

OPIOID MAINTENANCE THERAPY IS NOT ASSOCIATED WITH TREATMENT FAILURE TO HEPATITIS C THERAPY IN A LARGE GERMAN MULTICENTRE COHORT

Stefan Mauss1, Dietrich Hüpke2, Elmar Zehnter3, Michael P. Manns4, Gerlinde Teuber2, Tarek Dahban6, Ulrike Meyer2, Bernd Möller2, Nektarios Dikopoulos8, Thomas Wittthé6, Jochen Brack10, Marek Stern11, Stephan Kaiser12, Renate Prinzing13. The bng hepatitis study group

Objective: The largest group of newly infected individuals with chronic hepatitis C in the Western world are intravenous drug users. Emerging data support treating individuals with peginterferon and ribavirin for chronic hepatitis C after stabilisation on opioid maintenance therapy (methadone or buprenorphine). However these data are based on small cohorts or substudies from trials with small patient numbers. Here we report data from a cohort of 2422 patients including 333 patients on opioid maintenance therapy. Methods: A total of 3547 patients treated with at least one dose of peginterferon alfa-2b and weight based ribavirin are currently included in a German multicentre cohort. Only patients included in this cohort beyond 72 weeks of baseline were included in this analysis (n=2422). Patients with missing data at week 72 were counted as treatment failures. Univariate analysis was performed for comparison of demographics in patients on opioid maintenance vs. remaining patients (age, sex, ALT, BMI, HCV-RNA, genotype, ribavirin dose, peginterferon dose). For logistic regression analysis sex, age, baseline HCV-RNA, HCV-genotype, BMI and opioid maintenance were used as independent variables. The dependent variable was being HCV-RNA negative (<400 IU/mL) or positive at week 72 (SVR). Results: Patients on opioid maintenance were younger (35.0±9 vs. 42.2±12 years, p<0.001), and more had genotype 3 (46.0% vs. 31.4%, p<0.001). HCV-RNA levels were lower (45.8% vs. 61.2% <400,000 IU/mL, p<0.001). SVR in all patients on opioid maintenance (n=333) was 64.1% vs. 56.0% in the remaining patients (n=2089) (p<0.05, univariate). In logistic regression analysis, variables positively associated with SVR were younger age, HCV-genotype 2/3 and baseline HCV-RNA <400,000 IU/mL (all p<0.001). Female sex showed a trend for SVR (p=0.055). Opioid maintenance therapy was not associated with treatment outcomes in the logistic regression analysis. Conclusion: Efficacy of peginterferon and ribavirin was not different for patients on opioid maintenance therapy. Due to favourable factors for SVR such as HCV-genotype 3, younger age and lower HCV-RNA, patients on opioid maintenance therapy showed a better adjusted SVR compared to patients not on this therapy. Treatment of patients on opioid maintenance therapy in daily practice is feasible and success rates are not inferior to results from prospective, controlled studies.

FINAL RESULTS OF THE CANADIAN POWER (PEGINTERFERON ALFA-2B PROSPECTIVE OPTIMAL WEIGHT-BASED DOSING RESPONSE) PROGRAM. SUSTAINED VIROLOGIC RESPONSE (SVR) TO WEIGHT-BASED PEGINTERFERON ALFA-2B + RIBAVIRIN IN A LARGE, MIXED COMMUNITY AND ACADEMIC OBSERVATIONAL STUDY

Paul Marotta1, Saya V. Feinman2, Cameron Ghent3, Linda Scully4, Michael Varenbu5, Jeff Daiter5, Helga B. Witt-Sullivan5, Jean Robert5, Barbara Romanowski5, John Farley9, Nabil Abadir10, Robert J. Bailey11, 1London Health Sciences Centre, London, ON, Canada; 2Mount Sinai Hospital, Toronto, ON, Canada; 3University of Western Ontario, London, ON, Canada; 4Ottawa Hospital - Civic Campus, Ottawa, ON, Canada; 5Ontario Addiction Treatment Centers, Richmond Hill, ON, Canada; 6Hamilton Health Sciences General Site, Hamilton, ON, Canada; 7Centre Sida Amitié des Laurentides, St. Jerome, QC, Canada; 8University of Alberta, Edmonton, AB, Canada; 9Private Practice, Vancouver, BC, Canada; 10Schering-Plough Canada Inc, Pointe Claire, QC, Canada; 11Royal Alexandra Hospital, Edmonton, AB, Canada

Background: To determine the impact of hepatitis C virus (HCV) genotype (G), baseline viral load, weight, and fibrosis stage on SVR rates in treatment-naive patients with chronic hepatitis C who were treated with weight-based peginterferon (PEG-IFN) alfa-2b and weight-based ribavirin (RBV) in a “real-life” observational setting. We report final SVR results from the POWer program. Methods: POWer was an open-label observational trial conducted in academic and community clinics across Canada between 2002 and 2006. All patients received PEG-IFN alfa-2b (1.5µg/kg/wk) plus RBV (800–1200mg/day) for either 24 [G2 and G3] or 48 weeks [G1]. SVR (defined as undetectable HCV RNA 24 weeks post-treatment) was stratified by genotype, baseline viral load, and fibrosis score. Results: 1977 patients initiated treatment. Patients were excluded if they had undetectable HCV RNA at end of treatment but no 6-month follow up, had no treatment data available, or had HCV/HCV coinfection. This analysis was based on 1800 patients, including those who discontinued because of side effects, lack of response, or personal reasons. Most patients were infected with G1 (60%), followed by G3 (22%) and G2 (15%). Three percent of patients had G4/G5/G6 or no specified genotype. Baseline viral load was available in 1477 patients; 52% had high viral load (HVL; >600,000 IU/mL or 2×106 copies/mL). Liver biopsy specimens were available in 946 patients (53%), revealing F0-F2 fibrosis in 60% and F3-F4 fibrosis/cirrhosis in 40%. SVR rates were higher in patients with minimal (F0-F2) fibrosis than in those with advanced (F3-F4) fibrosis/cirrhosis (60% vs 35% P<0.001) and in patients with low viral load than in those with HVL (57% vs 50% P=0.009). Baseline viral load and fibrosis score were negative predictive factors for SVR in G1 and G3 patients but not G2 patients. Conclusions: Despite poor predictive factors (advanced fibrosis and HVL), excellent SVR rates and low relapse rates with PEG-IFN alfa-2b plus RBV may be attained in a real-life observational setting. Observational trials include a more heterogeneous patient population than those observed in controlled trials and provide useful information to practitioners and regulators on postapproval drug use.

255 INFLUENCE OF NK CELL RECEPTOR AND HLA-C LIGANDS GENES ON THE RESPONSE TO ANTIVIRAL THERAPY OF CHRONIC HEPATITIS C INFECTED PATIENTS

Valdirene L. Carneiro, Denise C. Lemaire, Maria Teresita Bendichio, Sabrina L. Souza, Lourianne N. Cavalcante, Patricia S. Brandao, Luiz G. Lyra, Andre C. Lyra

Virologic and host factors are associated with response to antiviral therapy in patients with chronic hepatitis C. The activation of the natural killer cells is important to limit viral replication in the liver. Therapy with interferon appears to be more effective in individuals with HCV infection in which NK cells are activated by this drug. The function of NK cells is regulated by a balance between the signals generated by its cellular receptors (KIR) of activation and the inhibition through the interaction with HLA class I molecules in the target cells. Khakoo et al (Science, 2004) found that the presence of the receptor-ligand pair KIR2DL3/HLA-C1 has a role in the clearance of acute HCV infection. Aims: to evaluate the role of the KIR and HLA-C ligands genes on the response to antiviral therapy of chronic HCV infected patients. Methods: We compared the frequency of KIR genes and their receptor-ligands pairs between 45 patients with chronic HCV infection who had a sustained virologic response and 41 subjects who were non-responders to combination therapy with standard or pegylated interferon and ribavirin. A hundred and two blood donors served as controls. Genotyping of the KIR was carried out using PCR-SSO kit (One Lambda, Canoga Park, CA, USA). Results: There was no difference between responders and non-responders in terms of ethnic origin, however there was a female predominance among non-responders. No difference related to ethnic background was found between the HCV patients and healthy controls but the latter group had a higher frequency of males. We observed a lower frequency of the genes KIR2DL5 (38% vs 64%) and KIR2DS3 (24% vs 46%) (p=0.03) among responders compared to non-responders. On the contrary, there was higher frequency of the receptor-ligand pair KIR2DL3/HLA-C1 among patients who responded to therapy compared to non-responders (64% vs 39%) (p=0.018). The Mantel-Hazel test ruled out any influence of the HCV genotype on the differences detected. When all patients with chronic hepatitis C were compared to the healthy blood donors, a higher frequency of the genes KIR2DL5 (OR=1.79; CI=1.01-3.19), 2DS5 (OR=1.96; CI=0.98-4.05) and 3DL3 (OR=2.39; CI=1.05-5.83) was found in the former group. Conclusions: Our data suggest that host factors such as the NK cellular receptors genes KIR2DL5 and KIR2DS3 are associated with non-response to antiviral therapy. On the other hand the receptor-ligand pair KIR2DL3/HLA-C1 may favor the response to antiviral treatment among patients with chronic hepatitis C. In addition, the genes KIR2DL5, 2DS5 and 3DL3 may play a role in the predisposition to the development of chronic HCV infection.

256 HEPATIC EXPRESSION OF INNATE IMMUNE MOLECULES WITH RESPECT TO INTRAHEPATIC HCV REPLICATION AND OUTCOMES OF PEGINTERFERON PLUS RIBAVIRIN COMBINATION TREATMENT

Nobukazu Yuki, Shintaro Matsumoto, Michio Kato, Toshikazu Yamaguchi

Background: Recognition of dHCV RNA by TLR3 and RIG-I results in IFN-β production in the liver, which in turn upregulates PAMP receptor expression. HCV proteins in infected cells interrupt this amplification loop. The clinical relevance of overall hepatic expression of these molecules remains unclear. Methods: From ten liver tissues were obtained from 49 patients with HCV genotype 1b. Positive- and negative-strand HCV RNA was quantified by real-time PCR and expressed as copies/100 ng RNA (J Hepatol 2006; 44: 302-9). Relative expression of TLR3, RIG-I and IFN-β mRNA was determined by real-time PCR using the comparative Ct method, where the target amount was normalized to GAPDH mRNA and relative to a normal liver reference. All patients were treated with weight-based PEG-IFNα2b (60-120µg/kg/wk) plus ribavirin (600-1000 mg/day) for 48 wk. Treatment was extended to 72 wk in SVR (HCV RNA-positive at wk 12 but negative at wk 24). Virologic response was analyzed on a per protocol basis. Results: TLR3, RIG-I and IFN-β mRNA were expressed with significant correlations (r =0.474 to 0.497, P<0.001). TLR3 and IFN-β mRNA levels bore no relation to HCV replication, whereas RIG-I mRNA was directly correlated with replication assessed by liver positive- and negative-strand HCV RNA (r = 0.420, P = 0.003 and r = 0.487, P<0.001, respectively) but not with serum HCV RNA (r = 0.078, P = 0.594). TLR3 mRNA levels were higher in 18 women than in 31 men (median 1.9, range 0.6-3 vs. 1.3, 0-3.6; P = 0.043). Otherwise, expression of the innate immune molecules had no relation to baseline patient characteristics. The medians (range) of TLR3 mRNA expression were 1.2 (0-4.9) for EVR at wk 12 (>2 log drop or undetectable HCV RNA)(n = 34) vs. 2.4 (0.1-6.3) for no EVR (n = 11)(P = 0.008), 1.0 (0-3.4) for VR at wk 24 (undetectable HCV RNA)(n = 26) vs. 2.2 (1.1-4.9) for no VR (n = 14)(P<0.001), and 0.9 (0.4-2.4) for EVR at wk 48 (n = 15)(P = 0.001)
for SVR \( (n = 22) \) vs. 1.9 \( (0.4-4.9) \) for no SVR \( (n = 16) \) (\( P = 0.004 \)). Positive and negative predictive values of TLR3 mRNA expression of <1.5 were 90 \( (19/21) \) and 38% \( (9/24) \), respectively, for EVR, 95 \( (18/19) \) and 62% \( (13/21) \) for VR at wk 24, and 89 \( (16/18) \) and 70% \( (14/20) \) for SVR. In contrast, RIG-I and IFN-\( \beta \) mRNA expression were not associated with the treatment outcomes. Conclusions: TLR3, RIG-I and IFN-\( \alpha \) are expressed in the liver with a shared regulatory mechanism but bear distinctive relevance. Only RIG-I is upregulated in parallel with HCV replication, raising a possibility that RIG-I serves as a major viral sensor. In the context of antiviral therapy, favorable treatment outcomes can be efficiently predicted by low levels of TLR3 expression at baseline.

257

EARY HEPATITIS C VIRUS DECAY WITH WEIGHT-BASED RIBAVIRIN PLUS EITHER PEGIFN-\( \alpha \)-2A OR PEGIFN-\( \alpha \)-2B IN HIV/HCV COINFECTED PATIENTS

Eugenia Vispo, Pablo Barreiro, Sonia Rodríguez-Novoa, Pablo Labarga, Luz Martín-Carbonero, Vicente Soriano; Department of Infectious Diseases, Hospital Carlos III, Madrid, Spain

Background: PegIFN plus RBV is the recommended therapy for chronic hepatitis C in HIV+ patients. Pharmacokinetic differences between the two available pegIFN molecules might impact on their respective antiviral activities. Methods: All consecutive HCV/HIV patients who had initiated first-line treatment with pegIFN-\( \alpha \)-2a or -2b plus RBV \( (1,000-1,200 \text{ mg/day}) \) at our institution were identified. Rapid and early virological responses (RVR and EVR), and undetectable HCV-RNA (<10 IU/mL) at week 24 were assessed by ITT analysis. Baseline liver fibrosis was estimated by transient elastometry. RBV plasma trough levels were measured by HPLC at week 12. Results: A total of 207 patients were identified, of whom 138 received -2a and 69 -2b. Their respective main features were: mean age, 45 and 44 years; male gender, 73 and 75%; mean BMI, 23 and 22 kg/m2; mean CD4 count, 547 and 523 cells/µL; HCV-RNA <50 cop/µL, 68 and 79%; mean HCV-RNA, 6.07 and 6.15 log IU/mL; G1/4, 67 and 73%; and mean hepatic stiffness, 10.9 and 9.9 KPa, respectively. Mean RBV plasma levels at week 12 were 2.4 and 2.3 ug/mL (\( p=ns \) for all variables). Comparing pegIFN-\( \alpha \)-2a and -2b, mean HCV-RNA decay (log IU/mL) was 2.7 and 2.2 at week 4 \( (p=0.09) \); 4.5 and 4.3 at week 12 \( (p=0.5) \); and 3.7 and 3.2 at week 24 \( (p=0.1) \). Virological responses were: RVR, 43 and 30\% \( (p=0.08) \); EVR, 71 and 70\% \( (p=0.8) \); undetectability at week 24, 64 and 58\% \( (p=0.4) \). The rate of RVR was better with pegIFN-\( \alpha \)-2a versus -2b in patients with baseline HCV-RNA >500,000 IU/mL (37 vs 15\%, \( p=0.01) \), and in patients carrying G2/3 (85 vs 56\%, \( p=0.02) \). In multivariate model (OR [95\% CI]), greater RBV plasma concentrations predicted RVR \( (1.39 [0.96-2.03] \) 0.07), EVR \( (1.83 [1.13-2.97] \) 0.01) and week 24 response \( (1.94 [1.23-3.05] \) 0.004), independently of the pegIFN used. The positive predictive value of RBV levels >2.1 ug/mL for week 24 response was 82\%. Conclusions: The intrinsic antiviral activity of pegIFN-\( \alpha \)-2a and -2b seems to be comparable, except for the very early phase of viral decay. However, in this study higher RBV plasma concentrations rather than the pegIFN modality were the main determinant of virological response at any time point.

ASSESSMENT OF THE IMPACT OF PSYCHIATRIC DISORDERS ON SAFETY, COMPLIANCE, AND SUSTAINED VIROLOGICAL RESPONSE AFTER HEPATITIS C TREATMENT (CHEOBS)

Jean-Philippe Lang\(^1\), Pascal Melin\(^2\), Denis Ouzan\(^3\), Michel Rotily\(^4\), Thierry Fontanges\(^5\), Patrick Marcellin\(^6\), Michel Chousterman\(^7\), Patrice Cacoub\(^8\); \(^1\)Centre Hospitalier Erstein, Erstein, France; \(^2\)Hôpital Général, Saint Dizier, France; \(^3\)Institut Arnaud Tzanck, Saint Laurent du Var, France; \(^4\)INSERM, Bagneux, France; \(^5\)Centre de l’Appareil Digestif, Bourgoin Jallieu, France; \(^6\)Hôpital Beaujon, Clichy, France; \(^7\)Hôpital de Créteil, Créteil, France; \(^8\)Hôpital Pitié Salpêtrière, Paris, France

Purpose: The CHEOBS study is a French multicenter, prospective, observational study designed to analyze the factors related to compliance with the combination treatment with Peginterferon-\( \alpha \)-2b and Ribavirin in patients (pts) with chronic hepatitis C virus (HCV) infection. This analysis evaluates mental safety, quality of life, compliance to treatment and sustained virological response (SVR) in pts presenting psychiatric disorders (ppd) before the start of HCV treatment and compares them with those of pts not presenting psychiatric disorders (ppd). Methods: From Jan 2003 to Dec 2004, 1,972 pts with chronic HCV infection were included in CHEOBS and began antiviral therapy: 444 ppd pts and 1,528 ppd pts. Among ppd pts, 232 (53\%) had depressive disorders, 179 (40\%) anxiety disorders, 21 (5\%) schizophrenia and 7 (2\%) bipolar disorders. Baseline characteristics and the impact of ppd on compliance, virological response and quality of life (QoL, SF-36) were analysed. Results: At baseline (Day 0), ppd and ppd populations were different as the ppd population was younger (45 years vs 47 years), with a lower educational level (68\% vs 53\%), less well paid jobs (48\% vs 61\%), higher debts (13\% vs 5\%), more chronic diseases (32\% vs 26\%), higher alcohol intake (31\% vs 23\%), higher tobacco (66\% vs 42\%) and drug consumption (9\% vs 2\%), and higher rate of genotype 3 infection (30\% vs 23\% \( p<0.05) \). At the end of HCV treatment, there was no significant difference between ppd and ppd populations for compliance, duration of combination antiviral therapy (35 ± 17 vs 36 ± 17 weeks), premature antiviral therapy discontinuation due to adverse events or the pts request (53\% vs 52\%). The results of SVR, mental adverse events and QoL are shown in the Table. Conclusion: In a real life study, pts infected by HCV and starting HCV treatment frequently present with psychiatric disorders. The ppd profile did not have a negative impact on compliance, duration, premature treatment discontinuation or SVR. The QoL was impaired by HCV treatment and its adverse effects that was even more pronounced in ppd pts.

DANAZOL INCREASES THE PLATELETS COUNT IN THROMBO-CYTOPENIC PATIENTS WITH CHRONIC HEPATITIS C AND LIVER CIRRHOSIS TREATED WITH PEG-INTERFERON ALFA 2A AND RIBAVIRIN

Guillermo Cabrera-Alvarez1, Luis Cañedo-Dorantes2, Jorge Reyes-Esparrza3, Lourdes Rodriguez-Fragoso3, Nahum Mendez-Sanchez5, Ana Burguet4, Vicente Madrid-Marinad,1 Gastroenterology, Universidad Autónoma del Estado de Morelos, Cuernavaca, Mexico; 2Faculty of Medicine, Postgraduate Division, Universidad Autónoma del Estado de Morelos, Cuernavaca, Morelos, Mexico; 3Faculty of Pharmacology, Universidad Autónoma del Estado de Morelos, Cuernavaca, Morelos, Mexico; 4Chronic Infections and Cancer Division, Instituto Nacional de Salud Publica, Cuernavaca, Morelos, Mexico; 5Liver Unit, Medica Sur Clinic & Foundation, Mexico city, Mexico

Background and Aim: Chronic hepatitis C (HCV) infection has been associated with the development of several extrahepatic alterations, including thrombocytopenia. Currently it remains unresolved. Danazol, an attenuated androgen has been successfully used in patients with autoimmune thrombocytopenia. The aim of the present study was to investigate the effects of Danazol treatment for thrombocytopenia associated with peginterferon alfa-2a and ribavirin therapy in naïve HCV patients. Methods: A prospective study carried out in patients with chronic hepatitis C or liver cirrhosis patients who were under antiviral therapy. The protocol was approved by the Review Board/Ethics committee of the Hospital. The inclusion criteria including both gender, age (20 to 70 yr), without co-infection with hepatitis B virus or human immunodeficiency virus (HIV-1/2), thrombocytopenia during peginterferon alfa-2a and ribavirin therapy was defined when the count was ≤ 90,000 platelets/mL in the last month. Danazol 300-600 mg/day was administered until the end of therapy. We considere as a control patients those on antiviral therapy who did not receive adjuvant danazol due to only mild thrombocytopenia on antiviral therapy, matched for baseline platelet count, presence of cirrhosis, age, sex and HCV genotype. Efficacy was evaluated as the capacity to increase in platelet counts until the end of the treatment period. Results: A total of 41 patients with HCV-associated thrombocytopenia with PEG IFN/ribavirin treatment were studied: 26 patients (20 females, 6 males), mean age of 54.57 ± 8.40 yr who received danazol and 15 controls (9 females, 6 males), mean age of 55.8 ± 13 yr. Ninety percent of 41 patients had cirrhosis and the HCV genotypes were similar between groups. The platelet count increases in the Danazol group from baseline (75300 ± 11502) after treatment (123,900 ± 30411 p<0.0063). Whereas in the control group the mean count range from (238953.3 ± 141962.9 to 1742020 ± 91643, p=0.9246) respectively. No association between genotypes and thrombocytopenia was observed (P>0.05). Danazol safety was assessed by the absence of collateral negative effects, except colestasis reversible in two patients. Conclusions: Adjuvant use of Danazol is associated with increased platelets counts in patients on antiviral therapy with interferon and ribavirin for HCV infection and cirrhosis. This is new therapeutic option to treat thrombocytopenia and maximize the sustained viremic response.
261 RELAPSE RATES AMONG HCV GENOTYPE 1 EARLY VIROLOGICAL RESPONDERS IN A RETROSPECTIVE COMMUNITY-BASED COHORT OF PATIENTS TREATED WITH PEGETRON® IN BRITISH COLUMBIA, CANADA

Amanda Yu1, Warren D. Hill1, Helen Mah1, Annie Mak1, Mel Krajden1,2, 1British Columbia Centre for Disease Control, Vancouver, BC, Canada; 2Pathology and Lab Med, Univ. of British Columbia, Vancouver, BC, Canada

PURPOSE: Response profiles from a community-based cohort of HCV genotype 1 infected patients undergoing a 48 wk course of Peginterferon alpha-2b plus Ribavirin (PEGETRON®) in British Columbia were assessed for the impact of residual viremia at wk 12 during Early Virological Response (EVR) determination. End of Treatment (EOT) response, Sustained Virological Response (SVR) and relapse rates were categorized with respect to whether a partial virological response or early virological clearance was achieved at wk 12. METHODS: Databases maintained by BC PharmaCare and the British Columbia Centre for Disease Control were used to calculate EOT, SVR and relapse rates among genotype 1 patients whose wk 12 EVR result was reported between June 12, 2003 and February 6, 2005. Patients were required to have a HCV RNA baseline viral load of > 61,500 IU/mL (Versant HCV 3.0 assay) and achieved an EVR. EVR was defined as either a > 2-log10 drop in viral load at wk 12 with residual viremia (wk 12 > 615 IU/mL or a positive qualitative HCV RNA (Roche, Cobas AMPLICOR), i.e. partial virological response); or a > 2-log10 drop in viral load at wk 12 with aviremia (wk 12 < 615 IU/mL or a negative qualitative HCV RNA, i.e., early virological clearance). Viral relapse was defined as a negative qualitative HCV RNA at EOT and detectable HCV RNA 24 wks after EOT. Relapse rates were reported as ranges to include or exclude missing SVR data. Lower range estimate was defined as EOT responder and SVR non-responder, and higher range estimate as EOT responder and SVR missing and/or non-responder.

RESULTS: A total of 696 HCV genotype 1 patients underwent wk 12 testing during PEGETRON® treatment between June 12, 2003 and February 6, 2005. Of these, 507/696 (73%) had baseline viral loads > 61,500 IU/mL and achieved an EVR. 380/507 (75%) demonstrated early virological clearance and 127/507 (25%) had a partial virological response at wk 12. EOT results were available for 248/507 (49%) of whom 204/248 (82%) were aviremic at wk 12 and 44/248 (18%) were viremic at wk 12. 197/248 (79%) were EOT responders; EOT response rate was 183/204 (90%) for aviremic at wk 12 and 14/44 (32%) for viremic at wk 12. Relapse rates for aviremic patients were 10% to 32% (low and high ranges) whereas for viremic patients at wk 12, the relapse rates were 50% to 79%. CONCLUSION: Among patients treated with PEGETRON® for 48 wks, EVR aviremic patients had an EOT response rate of 90% and relapse rates of 10% to 32%. In contrast, EVR viremic patients had an EOT response rate of 32% and relapse rates of 50% to 79%. The presence of residual viremia at wk 12 has an unfavourable outcome with fixed duration therapy.

262 VIRAL AND STAT KINETICS IN PATIENTS WITH CHRONIC HEPATITIS C TREATED WITH PEGEYLATED INTERFERON A-2B PLUS RIBAVIRIN

Giuseppe Malizia1, Gandolfo Giannuoli2, Elena Gallo2, Salvatore Madonia1, Emma Aragona3, Ornella Dino3, Giada Pietrosi3, Arolfo Rizzo2, Salvatore Pati4, Maria Grazia Vitale4, Patrizia Mondello4, Fabio Tiné2, 1Gastroenterologia, Ospedale V. Cervello, Palermo, Italy; 2Servizio di Anatomia Patologica, Ospedale V. Cervello, Palermo, Italy; 3Divisione di Medicina 1, Ospedale V. Cervello, Palermo, Italy; 4Servizio di Microbiologia, Ospedale V. Cervello, Palermo, Italy

Background: Treatment with pegylated interferon-α (PEG-IFN-α) and ribavirin (RBV) induces sustained virologic response (SVR) in about 55% of patients with chronic hepatitis C (HCV). Among several factors, HCV interference with IFN-α signal transduction Jak-STAT pathway has been proposed as a possible determinant of treatment failure. Viral kinetic studies have shown that early viral response predicts SVR. Aims: To evaluate kinetics of STAT proteins in peripheral blood mononuclear cells (PBMC) in comparison to viral kinetics and to assess whether STAT kinetics may predict the outcome in HCV patients with low probability of response. Methods: 15 patients with HCV genotype 1 (n=12) or 4 (n=3) treated with PEG-IFN-α 2b (1.5 mg/kg once weekly) plus RBV (1,000-1,200 mg daily) were prospectively evaluated one hour before treatment (T0) and at days 1 (T1), 2 (T2), 7 (T7) and 14 (T14) for quantitative serum HCV-RNA and PBMC cytoplasmic and nuclear STAT1 and STAT2. PBMC protein extracts were analyzed by Western blot and EMSA. Results: Six patients (40%) achieved SVR, two (13.3%) were relapers and seven (46.7%) were virologic non responders (NR). HCV-RNA levels fell ≥ 1 log in many patients, mostly responders, at T1 and T2, with an intermediate increase at T7. At T14, only seven patients showed a renewed ≥ 1 log HCV-RNA decline (5 SVR, 1 NR, 1 relaper). PBMC analysis showed that STAT1-STAT2 nuclear translocation was restricted to the SVR patients and one relaper with a proportion that progressively increased from T1 to T14. Among the seven patients showing STAT1-STAT2 in the nucleus of PBMC at T14, EMSA analysis showed both STAT2 and STAT1 DNA binding only in the six SVR. Comparing early viral and STAT kinetics during the first two weeks, we found that whereas the occurrence of a ≥ 1 log fall of HCV-RNA at T1 was in most cases not associated to STAT1-STAT2 nuclear localization in PBMC, the rate of this association increased through time, being highest at T14 (5 SVR, 1 relaper). When we compared STAT kinetics at T14 and virologic response at week 24, we found that among the eight HCV-RNA negative patients (six SVR and both relapers), only the six SVR showed also STAT1-STAT2 nuclear import and DNA binding, whereas none of the seven HCV-RNA positive patients showed nuclear STAT1-STAT2. Conclusions: Our data suggest that the variability of virological response to treatment with PEG-IFN-α and RBV is associated with intrinsic differences in the pattern of IFN signaling pathway and that STAT1-STAT2 nuclear translocation and DNA binding in PBMC may predict SVR as early as two weeks after treatment start.

MORPHOLOGICAL ANALYSIS AND ASSESSMENT OF HCV-RNA AND RIBAVIRIN CONCENTRATION IN SEMINAL FLUID OF CHRONIC HEPATITIS C PATIENTS UNDERGOING ANTIVIRAL COMBINATION THERAPY

Harald Hofer1, Josef Donnerer2, Katharin Sator3, Katharina Stauffer1, Thomas-Matthias Scherzer1, Clemens Dejaco1, Michael Sator3, Johannes Huber2, Harald Kessler4, Peter Ferenci5; 1Department of Internal Medicine III, Div. of Gastroenterology and Hepatology, Medical University of Vienna, Vienna, Austria; 2Department of Experimental and Clinical Pharmacology, Medical University of Graz, Graz, Austria; 3Department of Obstetrics and Gynaecology, Div. of Endocrinology and Reproductive Medicine, Medical University of Vienna, Vienna, Austria; 4Institute of Hygiene, Medical University of Graz, Graz, Austria

Background and Aim: At present, combination therapy with pegylated interferon-alpha and ribavirin is the treatment of choice for patients with chronic hepatitis C (CHC). Due to the possible teratogenic effect of ribavirin effective contraception is mandatory during antiviral therapy. Aim of the study was to evaluate seminal parameters, ribavirin and HCV-RNA concentration in seminal fluid and serum prior to and during antiviral treatment. Patients and Methods: So far, 10 male patients (mean age: 43±9 [years±SD]) were treated with combination therapy (Copegus®, Roche, Austria) in combination with ribavirin (Copegus®, Roche, Austria) were investigated. All patients were negative for HIV or HBV co-infection. The HCV genotype distribution was HCV-1 (n=5), HCV-2 (n=1), HCV-3 (n=1), HCV-4 (n=3). Seminal fluid (sperm concentration, motility and morphology) was analyzed morphologically. HCV-RNA and ribavirin concentration (serum and seminal fluid [diluted 1:10]) were determined by quantitative PCR (TaqMan®, Roche Austria); LOD: 10 IU/ml and HPLC, respectively. Examinations were carried out at baseline, at week 4 and at week 12 of antiviral therapy. Results: HCV-RNA was detectable in the seminal fluid of only one patient prior to antiviral therapy (with a serum viral load of 4.04 MU/ml) and was undetectable in all patients after 4 and 12 weeks of combination therapy. Ribavirin concentration was substantially higher in the seminal fluid (week 4: 4.7±1.9 µg/ml, [mean±SD]; week 12: 4.3±0.4) than in serum (week 4: 2.2±0.3 [p=0.01]; week 12: 1.9±0.3 [p=0.02]). Morphological semen abnormalities were common at baseline (asthenoteratozoospermia: n=4, asthenozoospermia: n=1, teratozoospermia: n=3). Sperm density (BL: 70±31x10^6/ml, Week 4: 50±32, week 8: 59±43 [n.s.]), percentage of sperms with progressive motility (BL: 45±25%, Week 4: 30±28, week 8: 30±23 [n.s.]), and percentage of sperms with normal morphology (BL: 21±14%, Week 4: 19±11, week 8: 11±6 [n.s.]) tended to further decrease during antiviral therapy. Conclusion: HCV-RNA is detectable in seminal fluid only in a low proportion of CHC patients. In contrast, pre-treatment semen abnormalities with reduced percentage of spermatozoa with normal progressive motility and normal morphology are common in patients with chronic HCV infection with further impairment during antiviral therapy. Ribavirin concentration is twofold elevated in seminal fluid compared to serum levels, which reinforces the need of contraception during antiviral combination therapy.

FOSAMPRENAVIR IN HAART SCHEDULE INDUCES A RAPID VIROLOGICAL AND BIOCHEMICAL RESPONSE TO HCV COUPLED TO TH1 BOOSTING IN HIV/HCV COINFECTED PATIENTS

Alessandro Perrella, Stella Grattacasa, Maria Rosaria Gnarini, Costanza Sbriglia, Luigi Atipaldi, Anna D'Antonio, Oreste Perrella; VII Dpt Infectious Disease and Immunology, Hospital D.Cotauno of naples, Naples, Italy

Objectives: Pegylated recombinant Interferon plus ribavirin after HAART induced immune system restoration is the treatment schedule in HIV/HCV patients (pts). We aimed to evaluate the effect of Fosamprenavir on immunological function in naïve-drug coinfected patients before to start treatment with Interferon plus ribavirin. Methods: We studied 10 naïve pts (4 F and 6 M) with HIV/HCV infection with at least one year history of HCV persistent infection and treated with: [AFC 300mg + 3TC 300mg Twice] + (Fosamprenavir 700mg twice) + (RTV 100mg)], assayin CD4+/CD4+, INF-γ and IL-4 ELISPOT specific response (HCV-core peptides; Pro-Immune,Oxford,UK), HIV and HCV Viral Load (Amplificor Roche system) and Transaminasis before to start HAART treatment (T0) and every month. Sign Test was used for statistic analysis. Results: At Time 0: CD4+ =186 ± 23 (mean ± s.d.); ALT= 121 ± 44; AST =93 ±31; HCV-RNA = 569x10^3 ± 23x10^3 IU/ml; HIV-RNA = 90x10^3 ± 19x10^3 IU/ml, while ELispot was IFN-γ 62 ± 10 SFC and IL-4 93 ±12 Spot Forming Colonies (SFCs). At T1: CD4+ = 414 ± 63; HIV-RNA = 209 ± 427 IU/ml but more surprisingly we had ALT = 22 ± 9; AST = 25 ± 8; HCV-RNA = 15x10^3 ± 30x10^3 IU/ml (two out of ten pts had become negative at Viral load). Concerning ELISPOT we had IFN-γ =112 ± 14 SFC and IL-4 = 52 ± 16 SFCs. At T3: CD4+ ≥ 486 ± 48, with negative HIV and HCV viral load and normal transaminasis serum levels. Differences were statistically significant (p <.01). Conclusion: Fosamprenavir treatment in HAART schedule induces a decrease of HIV-RNA with CD4+ increasing within the first month, but more interestingly also a rapid HCV virological and biochemical response with a boost of Th1 immune network. Fosamprenavir treatment may be an important strategy in the therapy of HIV/HCV naïve coinfected patients.

DISCLOSURES: The following people have nothing to disclose: Alessandro Perrella, Stella Grattacasa, Maria Rosaria Gnarini, Costanza Sbriglia, Luigi Atipaldi, Anna D'Antonio, Oreste Perrella

IMPROVED RESPONSE RATES WITH TREATMENT EXTENSION TO 72 WEEKS IN SLOW RESPONDERS TO PegIFINTERFERON AND WEIGHT-BASED RIBAVIRIN IN CHRONIC HEPATITIS C VIRUS (HCV) INFECTION

Brian Pearlman1,2, Carole Ehleben1; 1Center for Hepatitis C, Atlanta Medical Center, Atlanta, GA; 2Medical College of Georgia, Augusta, GA; 3Emory School of Medicine, Atlanta, GA

Background: For therapy-naive, chronic hepatitis C genotype 1-infected patients, treatment with pegylated interferon and ribavirin for 48 weeks has become the standard of care. For slow responders to treatment, there has been interest in extending therapy duration in hopes of improving rates of sustained virologic response (SVR). Two recent studies suggested that slow responders to treatment enjoy improved SVR rates with 72 weeks of therapy compared to 48 weeks, because of a diminution in rates of relapse; however, both studies used suboptimal doses of ribavirin (800 mg daily) (Gastroenterol 130:1086, 2006; Gastroenterol 131:431, 2006). It is unclear if therapy prolongation in slow responders would be beneficial, if weight-
based ribavirin were utilized. Methods: We analyzed data from two studies in which slow responders received either a customary treatment duration of 48 weeks or treatment extension to 72 weeks. One study was from the U.S. (Hepatology, In-press, 2007), and the other was from Europe (AASLD 2006, abs #390; EASL 2007, abs #641). The U.S. cohort was 48% African American and 52% Caucasian; the European cohort was 90% Caucasian. Slow response was defined by at least a 2-log decrement in baseline serum HCV RNA yet detectable viremia at 12 weeks of therapy with undetectable serum HCV RNA at 24 weeks. Slow responders in the European study also had detectable viremia at 4 weeks. The lower limits of RNA detection for the U.S. and European studies were 10 and 50 IU, respectively. Results: Rates of SVR were significantly superior in slow responders when treated for 72 weeks compared to 48 weeks, largely because of an improvement in relapse rate (Table). Conclusions: Treatment extension to 72 weeks relative to 48 improved SVR rates in slow-responders to peginterferon and weight-based ribavirin, in two disparate patient populations. SVR was improved because of a decrement in relapse rate. Results should be confirmed in larger prospective trials.

**GENE EXPRESSION BIOMARKERS PREDICTING RESPONSE TO PEGYLATED INTERFERON ALPHA (PEG-INFN) AND RIBAVIRIN (RBV) IN TREATMENT-NAIVE PATIENTS WITH CHRONIC HEPATITIS C (CH-C)**

Zobair M. Younossi1, Rochelle Collantes1, Ancha Baranova1, Anita Bakshi1, Maria Stepanova1, Ganiraju Manyam1, Chris Santini2, Chris Sigua2, Joanne Chan2, Ayuko Iverson2, Sheng-Yung Chang2; 1Center for Liver Diseases, Inova Health System - Inova Fairfax Hospital, Annandale, VA; 2Celera Diagnostics, Alameda, CA

Responsiveness to HCV therapy depends on viral and host factors. AIM: Develop a biomarker profile predicting sustained virologic response (SVR) after antiviral therapy. METHODS: 30 CH-C patients (naive) were started on standard doses of PEG-INFN alpha 2a or 2b and RBV. Blood samples were collected prior to treatment, 1 day, 1 week, 4 and 8 weeks after initiation of treatment. Total RNA was extracted, quantified and used for one step RT-PCR to profile 317 mRNAs (160 interferon-inducible, interferon pathway, immune response, and housekeeping related genes). Expression levels of mRNAs were normalized with 6 “housekeeping” genes and a reference RNA. Multiple regression analysis and stepwise selection were performed to assess differences in gene expression at different time points and predictive performance was evaluated for each model. RESULTS: Demographics: 47 ± 7 years, 64% Male, 61% Caucasian & 64% genotype 1 (G1). Prior to treatment, SVR was predicted by expression of STAT6 and CCL3 genes (Model p-value = 0.0063, AUC = 0.826, Sensitivity = 0.923, Specificity = 0.600) for all patients. In G1, SVR was predicted by expression of EP300 and SOC56 (Model p-value = 0.001, AUC = 0.940, Sensitivity = 0.857, Specificity = 0.917). At day 1, SVR for entire cohort was predicted by expression of IFN-dependent genes (IFIS3, IRF8, IL15RA, GTPBP2, BCL2) (Model p-value = 0.0094, AUC = 0.901, Sensitivity = 0.846, Specificity = 0.929) and by IL18 and ADAM9 in G1 (Model p-value = 0.0091, AUC = 0.909, Sensitivity = 0.857, Specificity = 0.909). At day 7, SVR for entire cohort was predicted by expression of IL10, IF8 and HIF1A (Model p-value = 0.0002, AUC = 0.928, Sensitivity = 0.769, Specificity = 0.867), while for G1, SVR was predicted by PRKIR (Model p-value = 0.009, AUC = 0.845, Sensitivity = 1.000, Specificity = 0.750). At Day 28, SVR was predicted by expression of AIM2, IRF2, YARS, IFNAR1, IRF8, HIF1A, CREB1 and CD58 (Model p-value = 4.482e-006, AUC = 1.000, Sensitivity = 1.000, Specificity = 1.000) for all patients. For G1, SVR was predicted by expression of AIM2, PLAUR, CCL3, IRF8 and CD58 (Model p-value = 0.00045, AUC = 1.000, Sensitivity = 1.000, Specificity = 1.000). At day 56, SVR was predicted by expression of PRKIR, IF5 and PSM2E (Model p-value = 0.000065, AUC = 0.959, Sensitivity = 0.846, Specificity = 1.000) for all patients and IRF4, IF5, TRAF6, TAP1, IFNAR1 and PSM89 in G1 (Model p-value = 0.000015, AUC = 1.000, Sensitivity = 1.000, Specificity = 1.000). CONCLUSIONS: A panel of non-invasive gene expression biomarkers is developed to predict SVR in CH-C patients (naive). If validated, this biomarker panel can become useful in the management of HCV.

**SUCCESSFUL ANTI-HCV THERAPY IS ASSOCIATED WITH SUSTAINED DOWNREGULATION OF PD-1 ON VIRAL-SPECIFIC CD8+ CYTOTOXIC T CELLS (CTLs) AND NATURAL KILLER CELLS (NKS)**

Lucy Golden-Mason1,2, Jared Klarquist1, Abdus S. Wahed2, Hugo R. Rosen1,2; 1Division of Gastroenterology & Hepatology, Hepatitis C Center & Department of Medicine, University of Colorado at Denver, Health Sciences Center, Denver, CO; 2Integrated Program in Immunology, University of Colorado at Denver, Health Sciences Center & National Jewish Hospital, Denver, CO; 3Department of Biostatistics, Graduate School of Public Health, University of Pittsburgh, Pittsburgh, PA

HCV Infection is characterized by impaired proliferative and cytotoxic function of immune cells. The effect of antiviral therapy on the immune response in HCV patients remains controversial. AIM: To characterize expression of PD-1 (an important marker of exhaustion) on immune cells in HCV-infected patients before and after antiviral therapy. METHODS: 72 HCV genotype 1 patients from the Virahep-C study cohort were selected (30 African Americans, 42 Caucasian Americans) based upon
expression of relevant HLA alleles. We used multi-parametric FACS to characterize PD-1 on T, NK, and natural T (NT) cells before and after therapy with combination pegylated interferon/ribavirin. A panel of 10 Class I pentamers incorporating frequently targeted HCV epitopes was used. Results: Compared to normal subjects, HCV-infected subjects had significantly higher PD-1 on both CD4+ and CD8+ T cells (p<0.0001) as well as higher PD-1 expression on CD56bright NK cells (considered immature NK cells with low natural cytotoxicity) (p<0.0001) and NT cells (p<0.0001). Highest PD-1 expression was found on HCV-specific CTLs (p<0.0001 vs total CD8). The effects of antiviral therapy on PD-1 levels on immune cells comparing patients before (SO02) and after (FU24) with and without a sustained virological response (SVR) by race. Achievement of an SVR was associated with a decrease in PD-1 expression on total CD4+ T cells as well as HCV-specific pentamer+ CTLs (Figure); whereas patients without an SVR had no change in PD-1 expression on total CD4+ T cells or HCV specific CTLs. Successful antiviral therapy also led to sustained down-regulation of PD-1 on NK cells, in particular the CD56bright subset (Median decrease=1.94%, p = 0.051; figure). In non-responder patients, levels of PD-1 on NK cells increased after treatment (Median=+2.1%, p=0.02). When adjusted for race, greater decline in PD-1 expressions on NK cells was significantly associated with SVR in AAAs only. Conclusions: Collectively, these data indicate that PD-1 is plays a critical role in the lack of vigorous immune responses to HCV during persistent infection and is upregulated globally on numerous cell types. Successful antiviral therapy results in decreases in PD-1 expression and restoration of immunity.

268 TREATMENT OF RECENTLY ACQUIRED HEPATITIS C INFECTION IN INJECTING DRUG USERS: PRELIMINARY RESULTS FROM THE AUSTRALIAN TRIAL IN ACUTE HEPATITIS C (ATAHC)

Gregory J. Dore1, Margaret E. Hellard2,4, Gail V. Matthews1, Paul S. Haber2, 6, David R. Shaw11, Barbara Y. Yeung1, Kathy Petoumenos1, Ingrid A. van Beek2, Geoff W. McCaughan1, Yong Pan10, Rosemary A. Ffrench3, William D. Rawlinson9, 10, Andrew R. Lloyd7, John M. Kaldor1; 1National Centre in HIV Epidemiology and Clinical Research, The University of New South Wales, Sydney, NSW, Australia; 2Kirketon Road Centre, Sydney, NSW, Australia; 3Burnet Institute, Melbourne, VIC, Australia; 4Infectious Diseases Unit, The Alfred Hospital, Melbourne, VIC, Australia; 5Drug Health Service, Royal Prince Alfred Hospital, Sydney, NSW, Australia; 6Discipline of Medicine and School of Public Health, University of Sydney, Sydney, NSW, Australia; 7School of Medical Sciences, University of New South Wales, Sydney, NSW, Australia; 8Royal Prince Alfred Hospital, Sydney, NSW, Australia; 9School of Biotechnology and Biomolecular Sciences, University of New South Wales, Sydney, NSW, Australia; 10Virology Division, SEALs Microbiology, Prince of Wales Hospital, Sydney, NSW, Australia; 11Infectious Diseases Unit, Royal Adelaide Hospital, Adelaide, SA, Australia

Short duration treatment for acute hepatitis C virus (HCV) infection with pegylated interferon monotherapy has been shown to be highly effective, but has been investigated to a very limited extent in injecting drug users (IDUs), even though they are the population most at risk of infection in many high-income countries. The Australian Trial in Acute Hepatitis C (ATAHC) was funded by the US National Institutes of Health to examine the natural history and treatment of recently acquired HCV in IDUs. A longitudinal cohort was defined by having a first positive anti-HCV antibody test within 6 months of screening, plus either a negative antibody test within the preceding 24 month period or acute clinical hepatitis within the prior 12 months. Those in the cohort with detectable HCV RNA at screening were assessed for treatment with PEG-IFN α-2a (180 mcg weekly for 24 weeks), and follow up was undertaken in parallel protocols for both treated and untreated participants. Treatment outcomes among the initial 50 HCV monoinfected subjects commenced on treatment are presented on all subjects, and separately on only those subjects with available HCV RNA assessment at week 24. Since August 2004, 132 participants have been enrolled, with 85 (64%) commencing treatment, including 87 with HCV infection and 26 with HIV/HCV co-infection. Of the initial 50 participants with HCV only who received treatment (mean age 30 years, 66% male), 41 (82%) became infected via injecting drug use. Half had HCV genotype 1, the median HCV RNA was 380,000 copies/ml, and 23 (46%) had symptomatic acute infection. HCV treatment commenced a median 35 weeks (range, 18 – 81 weeks) after the estimated date of infection. Two thirds received 80% or more of the 24 planned PEG-IFN injections and 5 subjects (10%) received less than 50%. End-of-treatment response (ETR) as defined by undetectable HCV RNA at 24 weeks was 60% overall and 75% in those with available HCV RNA results. ETR was not related to prior duration of infection: <35 weeks (56%) vs >35 weeks (64%). At a median 26 weeks after treatment, 23 out of 24 assessable participants who were HCV RNA negative at week 24 still had undetectable HCV RNA. In this cohort of people who had newly acquired hepatitis C infection predominantly acquired through injecting drug use, the outcome of PEG-IFN α-2a monotherapy was very encouraging. Strategies to improve HCV treatment adherence in this population may further enhance these outcomes.

269 SHORT-TERM PROLONGATION OF PEGINTERFERON PLUS RIBAVIRIN COMBINATION THERAPY IS A SAFE AND EFFECTIVE TREATMENT STRATEGY FOR GENOTYPE 1B CHRONIC HEPATITIS C PATIENTS

Hiroki Ikeda1, Michihiro Suzuki1, Chikao Okuse1, Minoru Kobayashi1, Hideki Takahashi1, Nobuyuki Matsuura1, Hiroshi Yamaguchi2, Takashi Yasuda2, Shiro Iino1, Fumio Itoh1; 1Department of Internal Medicine, Division of Gastroenterology and Hepatology, St.Marianna University, School of Medicine, Kawasaki, Japan, Kanagawa, Japan; 2Department of Infectious Diseases, University of Tokyo, Tokyo, Japan; 3Kiyokawa hospital, Tokyo, Japan

Introduction: It has been shown that 72 weeks (wks) of peginterferon plus ribavirin combination therapy (PEG/R) for genotype 1 chronic hepatitis C (CHC) patients, whose serum HCV RNA was positive at 4 wks of treatment increases sustained
viral response (SVR) rate. However, the prolongation of treatment duration increases therapy discontinuation because of the decrease of medication tolerability and the increase of medical expense. This result suggests 72 wks of PEG/R is difficult for some patients to complete. In this study, we focused on the patients with early viral response. Since they represent about a half of patient population, an increase of SVR rate of these patients should greatly affect the overall SVR rate. We set short-term prolonged treatment durations of PEG/R for genotype 1b CHC patients, depending on the time point when serum HCV RNA turned negative. And its efficacy was evaluated. Methods: Total of 52 genotype 1b CHC patients (30 male, 22 female, mean age 55±1 years) were enrolled in this study from December 2004 to September 2005. They were treated with peginterferon alpha 2b (1.0-1.5 μg/kg/wk) and ribavirin (600-1000mg/day) and serum HCV RNA levels were estimated every 4 wks. The viral response was defined and the treatment durations were determined by the time point when serum HCV RNA turned negative. 1) 4 wks; rapid viral response (RVR); 48wks duration, 2) 8 wks; early viral response (EVR); 52wks duration, 3) 12 wks; EVR; 56 to 60 wks duration, 4) 16 to 24 wks; late viral response (LVR); 72 wks duration. Patients with positive serum HCV RNA at 24 wks finished treatment without prolongation of PEG/R. And we prospectively investigated SVR rates of these groups. Results: Numbers of the patients achieved RVR, EVR and LVR were 4 (7.6%), 28 (53.2%) and 6 (11.5%), respectively. Only two patients (3.8%) could not complete this treatment protocol. SVR rates of the RVR, EVR and LVR patients were 100% (4/4), 78.6% (22/28) and 66.7% (4/6), respectively. The SVR rate of these 3 groups was 78.9% (30/38). While 86.4% (19/22) of male and 85.7% (6/7) of female under age of 55 achieved SVR, only 44.4% (4/9) of female aged 55 or over achieved SVR. Conclusion: Our results suggest that the short-term prolonged treatment duration of PEG/R determined by the time when serum HCV RNA turned negative is a safe and effective treatment strategy for genotype 1b CHC patients. However, this treatment is insufficient for female age 55 or over.

270 ELEVATED EXPRESSION AND POLYMORPHISMS OF SOCS3 INFLUENCE PATIENT RESPONSE TO ANTIVIRAL THERAPY IN CHRONIC HEPATITIS C

Marcello Persico1, Mario Capasso2, Roberta Russo2, Eliana Persico1, Vincenzo La Mura1, Claudio Tiribelli13, Achille Iolascon13
1Internal Medicine and Hepatology, SUN, Napoli, Italy; 2Biotecnologie Avanzate, CINEGE, Napoli, Italy; 3Centro Studi Fegato, Trieste, Italy

Background: The response to antiviral therapy of chronic hepatitis C virus (HCV) infection is determined by virological, environmental and genetic factors. We have tested the hypothesis that the expression of specific genes and their haplotype frequencies can differentiate between non-responders (NRs) and sustained virological responders (SVRs) to antiviral treatment. Methods: We used a methodological approach based on molecular marker-discovery and validation to study the genes influencing the antiviral treatment in lymphoblastoid cell lines from 74 genotype 1b hepatitis C virus patients (44 from Southern Italy and 30 from Northern Italy) treated with pegylated interferon-α and ribavirin. Furthermore, we performed an association study, testing three single nucleotide polymorphisms of SOCS3 in 162 NR and 184 SVR subjects [SOCS3 -8464 A/C (rs12952093), -4874 A/G (rs4969170), and 1383 A/G (rs4969168)]. Findings: SOCS3 basal expression levels were significantly increased in two independent sets of NR groups (P<0.05). We found a highly significant association between NRs and both the positively associated haplotype (OR=2.01, 95% CI: 1.15-3.50, P=0.0002) and the negatively associated haplotype (OR=0.56, 95% CI: 0.42-0.76, P=0.0014). In particular, the SOCS3 -4874 AA genotype was strongly associated with failure of antiviral therapy (OR=4.00, 95% CI: 2.09-7.66, P=0.0003) and the AA genotype carriers had significantly higher SOCS3 mRNA and protein levels (P<0.05). Interpretation: Basal levels of SOCS3, an inhibitor of the interferon-α-induced Janus kinase-signal transducer and an activator of transcription pathways, and its genetic polymorphisms influence the outcome of antiviral treatment. SOCS3 thus represents a new blood biomarker for the a priori prediction of treatment response.

271 PREDICTORS OF RESPONSE TO PEGYLATED INTERFERON-α2A AND RIBAVIRIN IN A COHORT OF PATIENTS INFECTED WITH THE SAME STRAIN OF HCV: THE O’BRIEN PROJECT

Valeria I. Descazi1, Silvina E. Yantorno1, Sonia M. Soria1, Fernando M. Cairo1, Nancy Massenzio1, Jorge E. Gonzalez2, Maria S. Munne1, Gaston Picchio3, Federico G. Villamil1, Liver Unit, Fundacion Favaloro, Buenos Aires, Argentina; 2Virology, InAV Lab, Buenos Aires, Argentina; 3Virco Lab.Inc., Raritan, NJ

O’Brien is a small rural town of Argentina (2200 inhabitants) with a high prevalence of HCV infection (102/1832 (5.6%), 12.6% in >40 years, 23.4% in >60 years). All viremic patients (n=83) were infected with genotype 1b and showed 90.4-97.5% homology in NS5b nucleotide sequencing (Hepatology, 2002: 1660A). The presumed common source of infection, present in all patients, was the administration of unsafe injections a mean of 35 years before diagnosis. Goals: to analyze results of combined pegylated interferon-α2A (PEG) and ribavirin (RIB) therapy for 48 weeks and to identify predictors of sustained virological response (SVR). Methods: the study included 32 patients (50% males) aged 51±10 years. Viral load was investigated by Amplicor Monitor 2.0 and HCV RNA by RT-PCR. At baseline 21 patients (75%) had high VL (>80000 IU, mean 6.4±0.8 log IU) and only 9 (28%) elevated ALT. Liver biopsy showed stage 0 in 2, 1 in 5, II in 12, III in 6 and IV (cirrhosis) in 5 patients by METAVIR score. Patients received 180 μg/week of PEG and 1000-1200 mg/day of RIB according to body weight (> or <75 Kg). Results: Two patients discontinued therapy (weeks 2 and 8) due to adverse effects and the remaining 30 completed 48 weeks. Dose reductions of PEG were required in 5/30 (17%) patients and of RIB in 8/30 (27%). However, all fulfilled the 80%/80%/80% rule at all time points of treatment. Thirteen patients (43%) received G-CSF and 6 (20%) EPO. On an intention-to-treat basis, virological responses were: 91% (29/32) at week 12 (EVR), 91% at week 24, 91% at week 48 (ETR) and 59% (19/32) at week 72 (SVR). Predictors of SVR by univariate analysis were age (48±2 vs. 56±2 years, p=0.039), significant alcohol (>80 grams in males and >50 grams in females) consumption (10.5% vs. 45.5%, p=0.029), low fibrosis stages (p=0.008) and cirrhosis (0% vs. 45.5%, p=0.001). Female gender (63% vs. 27%, p=0.058), lower BMI (25±1.5 vs. 29±1, p=0.08) and low VL...

TIME TO HCV RNA NEGATIVATION IN HEPATITIS C VIRUS (HCV) TYPE 1-INFECTION DURING PEG-INTERFERON-ALPHA-2B PLUS RIBAVIRIN THERAPY: DIFFERENCES IN RELATION TO THE ASSAY SENSITIVITY (INDIV-1 STUDY GROUP)

Thomas Berg¹, Viola Weich¹, Gerlinde Teuber², Hartwig Klinker³, Bernd Möller⁴, Jens Rasenack⁵, Holger Hinrichsen⁶, Tilman Geraldi⁷, Ulrich Spengler⁸, Peter Buggisch⁹, Heike Balk⁹, Myrga Zankel¹⁰, Christoph Sarrazin¹, Stefan Zeuzem²

The following people have nothing to disclose: Valeria I. Descalzi, Silvina E. Yantorno, Sonia M. Soria, Fernando M. Cairo, Nancy Massenzio, Jorge E. González, Maria S. Munne, Gaston Picchio, Federico G. Villamil

showing frequencies of around 3.5-6.7% per week. Conclusion: The most important discrepancies between the two test systems (bDNA vs TMA) with respect to frequency and rate of virologic response can be observed within the first 12 weeks of therapy. At the end of treatment, however, frequencies of undetectable HCV RNA levels did not differ greatly and reached around 70% independently whether bDNA or TMA was used. From all these data it emerges that there is a risk to overestimate virologic response rates when HCV RNA levels are only assessed by the quantitative assay.

The following people have nothing to disclose: Thomas Berg, Viola Weich, Gerlinde Teuber, Hartwig Klinker, Bernd Möller, Jens Rasenack, Holger Hinrichsen, Tilman Geraldi, Ulrich Spengler, Peter Buggisch, Heike Balk, Myrga Zankel, Christoph Sarrazin, Stefan Zeuzem

273

IMPACT OF ANTIVIRAL THERAPY AND RESPONSE TO TREATMENT ON LONG-TERM OUTCOME OF CHRONIC HEPATITIS C (CHC): A PROPENSITY SCORE ANALYSIS IN A POPULATION-BASED COHORT OF 1159 PATIENTS

Elisabeth Monnet¹, Julien Crouzet¹, Anne Minello², Thierry Thévenot³, Alice Gagnaire⁴, Valérie Jooste², Patrick Hillon⁵, Vincent Di Martino⁶, ¹Service d’Hépatologie, CHU Jean Minjoz, Besançon, France; ²Registre des hépatites virales, Faculté de Médecine, Dijon, France

Background: The effect of antiviral therapy and sustained virologic response (SVR) on the long-term outcome of CHC has never been assessed through population-based cohort study reflecting usual medical practice using clinical endpoints. Concerns can be raised for clinical trials and observational studies which suggested the clinical benefit of antiviral therapy regarding representativeness of the studied population, follow-up duration, or selection biases associated with treatment allocation. The aim of this study was to assess treatment and SVR effects on the outcome of 1159 HCV mono-infected viremic patients recruited in a well-defined population of 1,005,817 inhabitants, using the propensity score technique to reduce bias in the comparison of non-randomized treatment groups. Methods: All HCV mono-infected viremic patients diagnosed in the study area between 1994 and 2001 were included and followed for 4.9±2.6 years. 409 patients (35.2%) received antiviral therapy ([peg]-interferon-α±ribavirin), of whom 142 (34.7%) achieved SVR. The effects of antiviral therapy and SVR on the risk of decompensated cirrhosis, hepatocellular carcinoma and death (liver-related or not) were estimated separately by time-dependent Cox regression analyses including a propensity score to adjust for observable differences between treated and untreated patients and considering all the demographic variables known to influence the natural history of CHC. Results: Treated and untreated patients were significantly different for age, gender, place of residence, route of infection, self-reported excessive alcohol consumption, and liver damage according to the Metavir score. Using Kaplan-Meier estimates, the 5-year rates of decompensated cirrhosis and of all-causes and liver-related deaths were 6.0%, 18.5% and 6.5% in untreated patients, 2.6%, 4.9% and 2% in treated patients who did not achieve SVR, and 0.7%, 0% and 0% in treated patients who achieved SVR, respectively (p=0.019 and p<0.0001 by log-rank tests). Propensity-adjusted multivariable Cox regression failed to demonstrate a better outcome in patients who received antiviral therapy, despite lower RR of cirrhosis decomposition (0.45) and hepatocellular (0.29) and the 0% rate of death in patients who achieved SVR. Interestingly, the risk of all-causes
DEATH: 0.48 for treated patients without SVR (p=0.06). Conclusion: This population-based study suggests a benefit of antiviral therapy on the long-term outcome of CHC. Using propensity-adjusted Cox regression analysis, the complete demonstration should be given with a larger studied population and/or a longer follow-up duration to increase the number of events.

274 ARTIFICIAL INTELLIGENCE PLATFORM FOR CHRONIC HEPATITIS C (CHC): PREDICTION OF CLINICAL OUTCOME AND MORE EFFICIENT TREATMENT WITH PEGYLATED INTERFERON PLUS RIBAVIRIN

Maria Trapero-Marugan1, Manuel Marin2, Oscar Nuñez3, Xamila SAlcedo-Mora1, Jose Manuel del Rio2, Juan Pablo Pivel2, Gerardo Clemente3, Ricardo Moreno-Otero1; 1Liver Unit, Hospital Universitario de La Princesa, Madrid, Spain; 2APARA, Madrid, Spain; 3Liver Unit, Hospital Universitario Gregorio Marañon, Madrid, Spain

INTRODUCTION: no bioinformatics platform dedicated to study and to predict the clinical outcome as well as therapeutic rentability and efficiency of CHC exist. The accuracy of the prediction of the prognosis in CHC is estimated at less than 50% among physicians. AIMS: To develop an easy bioinformatic platform based on algorithm decisions (Bayesian network) for a better and more efficient prediction of treatment response, to identify key points in the progression of liver disease and to establish new factors involved in prognosis and treatment response. PATIENTS AND METHODS: 385 consecutive CHC patients (mean age 45±9 years; 45% females) treated were included. More than 40 variables (epidemiological, biochemical, virological, histological, type of treatment, type of response, adverse events, withdrawals...etc) were analysed and included in a database. DLife platform has been used in this database for constructing the bioinformatic model of CHC based on bayesian networks and novel algorithms that are very effective in modeling and simulating situations where there are some unknown data and permits the knowledge automatization. The prediction accuracy of the bioinformatic network was compared to the true data collected in a clinical retrospective study. The model was then validated twice with external data from CHC patients treated in other hospitals.

RESULTS: The accuracy of this bioinformatic network for treatment response in this cohort of 385 patients is 83.3%, which is higher than accuracy obtained by physicians based on the study of clinical data and their own experience (50-65%). Some variables were detected as ‘key points’ regarding treatment outcome: age at treatment, gender, weight, comorbidity, type of treatment, genotype and basal viraemia, presence of autoantibodies, basal T4 level, basal aminotransferase levels, haematological variables, and viraemia during the treatment and follow-up. The ROC curve areas after validation with another cohort of patients were: 0.907 for SVR, 1 for non-response and 0.81 for relapse after treatment and follow-up. CONCLUSIONS: This bioinformatic platform is an easy comfortable and a very intuitive tool for applying to CHC patients by clinicians. It is efficient for the prediction of treatment response in CHC patients with a higher accuracy than clinicians.

Disclosures: The following people have nothing to disclose: Maria Trapero-Marugan, Manuel Marin, Oscar Nuñez, Xamila SAlcedo-Mora, Jose Manuel del Rio, Juan Pablo Pivel, Gerardo Clemente, Ricardo Moreno-Otero

275 INSULIN RESISTANCE (IR) DEFINED BY THE HOMEOSTASIS MODEL OF ASSESSMENT INSULIN RESISTANCE (HOMA-IR) INDEX HAS A DIRECT EFFECT ON EARLY VIRAL KINETICS DURING PEGYLATED-INTERFERON THERAPY FOR CHRONIC HEPATITIS C

Gladis Bortoletto1, Stefano Realdon1,2, Francesca Dal Pero1, Martina Gerotto1, Laura Scribano2, Sara Bonisegna2, Diego Marines2, Alfredo Alberti1; 1VIMM, Padova, Italy; 2Department of Surgical and Gastroenterological Sciences, University of Padua, Padua, Italy

Background: Insulin resistance (IR), a central feature of the metabolic syndrome, has emerged as a key factor reducing the response to PEGylated-Interferon (PEG-IFN) based therapy in chronic hepatitis C. The pathogenic mechanisms underlying this association are still unclear. Aim: To examine the relationship of baseline serum insulin and of homeostasis model of assessment insulin resistance (HOMA-IR) index with the early virological response to PEG-IFN, taken as a measurement of the intracellular response to Interferon (IFN) signaling. Methods: In 30 patients treated with weight-based doses of PEG-IFN plus Ribavirin, baseline serum, insulin and HOMA-IR were measured the same day of the first IFN injection. HCV-RNA levels were measured by RealTime PCR (Abbott m2000, LoD 12 IU/mL) in all patients at baseline, as well as 24 hours and at week 1, 4, 12 after treatment initiation to define the individual kinetics of response. Results: Mean baseline insulin level was 13.38±7.21 mIU/L (range: 1.5-28) while, mean baseline HOMA-IR was 3.11±1.64 (range: 0.36-6.29). No statistically significant association was found between baseline insulin levels and baseline viremia or HCV-RNA decay at the different time-points during therapy. On the other hand, when patients were stratified by baseline HOMA-IR, those with high insulin resistance index showed a significant reduction in virus decay already at 24 hours and thereafter compared to cases with lower HOMA-IR (see Table). By Kaplan-Meier analysis, patients with HOMA-IR>4 had 0% rate of HCV-RNA negativity during the first 12 weeks of treatment while, the percentage of HCV-RNA negative cases among those with HOMA-IR<4 was 20% at week 1, 40% at week 4 and 50% at week 12. Baseline body weight and body mass index did not show a significant association with virus decay. Conclusions: We have demonstrated a direct effect of HOMA-IR on the early response during PEG-IFN based therapy for chronic hepatitis C, independently of insulin levels and BMI, suggesting that insulin resistance is the key factor in reducing the cellular response to IFN in hepatitis C infected patients.

TREATMENT OF CHRONIC HEPATITIS C WITH PEGINTERFERON ALFA-2A (40KD) (PEG) AND RIBAVIRIN (RBV) IN NAIVE PATIENTS WITH HIV-HCV CO-INFEC-TION IN THE REAL-LIFE SETTING IN GERMANY

Elmar Zehnter1, Stefan Mauss2, Klaus Boeker3, Thomas Lutz4, Stefan Racky5, Wolfgang Schmidt6, Rainer Ullrich7, Innesa Sbrijer8, Renate Heyne9, Andreas Schober10, Christine John11, Karl-Heinz Hey12, Bernd Möller13, Bernd Bokemeyer14, Birgit Kallinowski15, Stefan Pape16, Ulrich Alshuth17, Dietrich Hüppe18, 1Center of Gastroenterology, Dortmund, Germany; 2Center of HIV and Hepato-gastroenterology, Duesseldorf, Germany; 3Center of Gastroenterology, Hannover, Germany; 4Center of Infectiology, Frankfurt, Germany; 5Center of Gastroenterology, Bad Schwalbach, Germany; 6Center of Gastroenterology, Berlin, Germany; 7Center of Gastroenterology, Krefeld, Germany; 8General Practice, Dortmund, Germany; 9Levercenter, Berlin, Germany; 10Center of Gastroenterology, Goethingen, Germany; 11Center of Gastroenterology, Berlin, Germany; 12General Practice, Paderborn, Germany; 13Center of Gastroenterology, Minden, Germany; 14Center of Gastroenterology, Schwetzingen, Germany; 15Center of Gastroenterology, Paderborn, Germany; 16BU Hepatitis/HIV/Infectiology, Roche Pharma AG, Grenzach-Wyhlen, Germany; 17Center of Gastroenterology, Herne, Germany.

Background: HCV co-infection and related concomitant diseases, especially of the liver, have become more important since antiretroviral therapy has reduced morbidity and mortality associated with HIV. Clinical trials have demonstrated that treatment with PEG and RBV can achieve high rates of SVR in co-infected patients, but less is known about what happens in real life. Methods: The Association of German independent Gastroenterologists (bng) in cooperation with Roche conducted an observational study. From March 2003 to May 2007 data from >20,000 patients were collected from >500 centers. Efficacy, safety and compliance data were recorded. An analysis for naive patients with HCV-mono (MONO) - or HCV/HIV coinfection (CO) who have been treated with PEG and RBV, was performed. Results: 737/15636 patients were HIV/HCV co-infected. Treatment rate for CO was 34.1% [251/737] and 44.7% [6661/14899] for MONO. Reasons reported for not treating HIV in CO patients were patient desire 35.3%, com- mitant disease 17.5%, current drug use 16.6%, non-compliance 6.4%, lacking activity of disease 5.2% and decompensated liver disease 4.1%. Demographic data of analysed patients are presented in the table. 82.1% [87/106] CO and 87.9% [2599/2957] MONO reached an Early Virological Response (EVR) at week 12 [≥2-log10 drop in HCV RNA or HCV RNA undetectable], with 52.8% [82/156] CO and 65.3% MONO [2548/3904] presenting an EoT response. SVR was achieved by 39.1% [61/156] CO and 53.8% [2104/3906] MONO patients. A total of 42.3% [66/156] CO and 27.2% [1062/3906] MONO patients dis- continued therapy: 37.9/39.5% due to non-response, 27.3/26.4% for poor tolerability, 13.6/16.4% lost to follow-up, 15.2/10.8% for personal reasons and 12.1/9.4% for lack of compliance. The mean duration of treatment for G1 was 34.3 weeks in CO and 38.3 weeks in MONO. In G2/3, CO/MONO patients were treated for 31.4/24.0 weeks, resp. Conclusion: Although HIV co-infection is a serious and hepatis-accelerating disease only a third of CO patients had been treated with PEG and RBV. In this population, combination ther- apy was found to be reasonable safe and sufficiently effective even under real-life conditions. A challenge will be to convince co-infected patients of the need for therapy, whilst minimizing the discontinuation rate and hence the extension of treatment duration.

DOES PROLONGED THERAPY IN HCV-GENOTYPE 3 PATIENTS WITH HIGH VIRAL LOAD IMPROVE SUS-TAINED VIRAL RESPONSE RATES?

Stefan Mauss1, Dietrich Hüppe2, Elmar Zehnter3, Michael P. Manns4, Gerlinde Teuber5, Tarek Dahhan6, Ulrike Meyer7, Bernd Möller1, Nektarios Dikopoulos8, Thomas Witthöft9, Jochen Brack10, Marek Stern11, Stephan Kaiser12, Renate Prinz13, ...

Objective: The sustained viral response (SVR) in HCV-genotype 3 patients differs substantially depending on baseline viral load and viral response to therapy. Whereas patients with rapid viral response and low viral load show SVR rates >80%, patients with high viral load and no rapid viral response may reach SVR <50% after 24 weeks of therapy. These patients may be candidates for longer treatment durations. Here we report SVR data from a cohort of 3547 patients including 1148 patients with HCV-genotype 3 treated for 24 vs. 48 weeks with peginterferon and ribavirin. Methods: All patients were treated with at least one dose of peginterferon alfa-2b and weight based ribavirin as part of a German multicentre cohort. Only patients who were beyond 24 weeks of follow up after planned end of therapy (24 or 48 weeks) were included in this analysis (n=571). Patients were stratified according to HCV-RNA below or above/equal to 600,000 IU/mL. Patients with missing data at end of follow up were counted as treatment failures. Statistical analysis was performed using chi-square test. Results:
157/207 (76%) of patients with genotype 3 and HCV-RNA <600,000 IU/mL reached SVR after 24 weeks of therapy versus 82/115 (72%) after 48 weeks of therapy (p=0.05, n.s.). 123/160 (77%) of patients with genotype 3 and HCV-RNA >600,000 IU/mL reached SVR after 24 weeks of therapy versus 66/89 (74%) after 48 weeks of therapy (p=0.05, n.s.). Conclusion: Extending therapy from 24 weeks to 48 weeks for HCV-genotype 3 did not improve SVR rates regardless of baseline viral load. These results confirm findings from the initial prospective, controlled study by Hadziyannis et al. Ann Intern Med. 2004; 140(5):346-55. In addition SVR was comparable for patients with low and high viral load. However it can not be excluded from this study that a more targeted approach based on viral kinetics, i.e. slow viral response, may be beneficial for a smaller subgroup of patients.

278 Silymarin down-regulates HCV Core and up-regulates Heme Oxygenase-1 Gene Expression in the CNS3 Replicon Line of Human Liver Cells

Vania Bonifaz1, Ying Shan1, Richard Lambrecht1,3, Susan E. Donohue1,4, Darcy Moschenross1,2, Herbert Bonkovsky1,4, 1Molecular, Microbial and Structural Biology, University of Connecticut Health Center, Farmington, CT; 2Molecular, Microbial and Structural Biology, University of Connecticut Health Center, Farmington, CT; 3Pharmacology, University of Connecticut Health Center, Farmington, CT; 4The Liver-Biliary-Pancreatic Center, University of Connecticut Health Center, Farmington, CT; 5University of North Carolina, Charlotte, NC; 6Chemical and Biological Sciences, Universidad de las Americas-Puebla, Puebla, Mexico

Background: Hepatitis C virus (HCV) infection is a global medical problem. The current standard of care for chronic hepatitis C (CHC) is pegylated interferon plus ribavirin therapy, but this treatment is expensive, has significant side effects and, at best, is only 50% effective. Silymarin, the main active ingredient of milk thistle, is a natural antioxidant that is used by patients with CHC [Seeff et al, Gastroent, 2007], although its efficacy for decreasing HCV levels or ameliorating CHC remains uncertain. HCV infection is associated with increased hepatic oxidative stress, and one of the antioxidant enzymes which protects cells against this stress is heme oxygenase-1 (HO-1). Methods: We investigated the effects of silymarin on HCV and HO-1 gene expression in wild type Huh-7 cells, as well as two HCV replicon cell lines, CNS3 and 9-13 cells. Results: Silymarin (100 and 200µM) down-regulated HCV core mRNA (by 20% - 36%) and protein (by 30%-60%) in CNS3 cells. In contrast, silymarin did not decrease HCV N55A mRNA or protein expression in treated 9-13 cells; in fact, it increased N55A mRNA levels by two fold. HO-1 mRNA was up-regulated (60%-400%) by silymarin in Huh-7, CNS3 and 9-13 cells. To explore the mechanism by which silymarin up-regulates HO-1 mRNA, we measured the levels of Bach1 and Nrf2 transcription factors. Bach1 and Nrf2 mRNA levels were not affected by silymarin treatment in Huh-7 cells. In CNS3 and 9-13 cells, there was no clear relationship between silymarin-induced changes in Bach1 and Nrf2 and the induction of HO-1 mRNA. Conclusions: Silymarin significantly down-regulates HCV core mRNA and protein in CNS3 cells. The levels of the antioxidant enzyme HO-1 are up-regulated by silymarin, but the precise mechanism by which silymarin up-regulates HO-1 mRNA levels in these cell lines remains unknown. These and other recent results [Polyak et al Gastroent, 2007] suggest that silymarin is of benefit in CHC, although prospective, randomized clinical trials are needed to be certain.

279 Treatment of Hemodialysis (HD) Patients with Chronic Hepatitis C (CHC) Using an Escalating Dose Regimen of Pegylated Interferon (PEG-IFN) Alfa-2b

Soek Siam Tan1, Muhammad Radzi Abu Hassan2, Asmarani Abdullah1, Boon Phoe Ooi1, Sanjay Rampal2, Thomas Korompis4, Mohd Ismail Merican1, 1Selayang Hospital, Batu Caves, Selangor, Malaysia; 2Hospital Alor Star, Alor Star, Malaysia; University of Malaya, Kuala Lumpur, Malaysia; 4Schering-Plough Malaysia/Singapore, Petaling Jaya, Malaysia

Background: CHC is a prevalent condition among patients receiving HD, and post-renal transplant CHC patients have poorer treatment-related outcomes. Additionally, treatment with IFN therapy has been associated with graft rejection. In this study, we evaluated the efficacy and safety of PEG-IFN alfa-2b in CHC patients receiving HD. Methods: This study included treatment-naive CHC patients aged 18-70 years with compensated liver cirrhosis and adequate hematologic parameters. Patients with coinfection, significant cardiovascular dysfunction, uncontrolled diabetes, and any contraindications to IFN therapy were excluded. Of the 46 CHC patients undergoing HD who were screened, 34 enrolled in the study. All patients received PEG-IFN alfa-2b 0.5µg/kg/wk; doses were increased by 0.25µg/kg/wk every 4 wks if well tolerated. Maximum dose was defined as 1µg/kg/wk at 48 wks in patients with genotype (G) 1 and 24 wks in those with G2/3. Patients unable to tolerate study medication were discontinued from the trial. Results: Baseline patient characteristics included mean age of 41.4±11.9 years [61.8% ≥40 years]; males, 44.1%; G1, 70.6%; G3, 29.4%; mean body mass index, 22.6±4.4 kg/m²; median HD duration, 5.8 years [range, 3.8-8.2 years]; normal alanine aminotransferase (ALT) levels, 55.9%; HCV RNA ≥700,000 IU/mL, 50%; and fibrosis ≥2 (modified Histology Activity Index score), 26.5%. In total, 97% (33/34) of patients reached maximum dose; however, 21% were unable to maintain that dose. Early virologic response (EVR; undetectable HCV RNA [<50 IU/mL] at wk 12) was attained in 1.5 of 20 G1 patients; end-of-treatment (EOT) and sustained virologic responses (SVRs) were attained in 10 of 15 and 9 of 18 G1 patients, respectively. Conversely, 8 of 10 G3 patients attained EOT and SVR; and EVR and SVRs were attained in 8/9 and 8/10 G3 patients, respectively. Almost 30% [11/34] of patients discontinued treatment early because of adverse events (AE). The most commonly reported AE was anemia; 64.7% of patients required blood transfusions. Low-dose epoetin was administered to 85.3% of patients during the trial. One patient died during the study of acute coronary syndrome after the 41st dose. Conclusions: In total, SVRs were attained in 37.5% (9/24) of G1 patients undergoing HD who were treated for 48 wks with an escalating dose regimen of PEG-IFN alfa-2b monotherapy. In contrast, 80% (8/10) of G3 patients, who received only 24 wks of this therapy, attained SVR. These results indicate that G3 patients undergoing HD can be successfully treated with short-term PEG-IFN alfa-2b monotherapy. Because PEG-IFN alfa-2b can be associated with AEs, supportive therapy may be necessary.

IFN SENSITIVITY DETERMINING REGION IN NS5A OF HEPATITIS C VIRUS CORRELATES WITH THE RESPONSE TO PEG-IFN ALFA-2B PLUS RIBAVIRIN TREATMENT
Michihito Murao, Kyoko Kobayashi, Narumi Komura, Hiroaki Shimazaki, Takuji Nakano, Yoshifumi Nitta, Masao Harata, Naoto Kawabe, Senju Hashimoto, Kentaro Yoshioka; Division of Liver, Biliary Tract and Pancreas Diseases, Fujita Health University, Toyoake, Japan

Background: Many studies have linked the response to IFN mono-therapy to IFN sensitivity determining region (ISDR) in NS5A, while this remains controversial. PEG-IFN alfa-2b plus ribavirin (RBV) has improved sustained virological response (SVR) rate from 5% of IFN mono-therapy to 60%. Few reports have studied whether ISDR is also an important predictor for the response in PEG-IFN plus RBV treatment as well as in IFN mono-therapy. Aim: To evaluate the correlation of ISDR with the response to PEG-IFN plus RBV treatment. Methods: The sequence of ISDR of 65 patients treated with PEG-IFN plus RBV was determined by PCR and direct sequencing. Results: Eleven patients had 4 or more mutations in ISDR, 25 had more than one to less than 4 mutations, and 29 had one or less mutations. Nine patients became negative for HCV RNA by week 4, and obtained rapid virological response (RVR). RVR rate was significantly higher in the patients with 4 or more mutations (55%) than in the other patients (6%)(p=0.0004). Multivariate analysis revealed that ISDR was the only independent factor predicting RVR (OR=0.04, 95%CI=0.003-0.485, p=0.012). Thirty two patients became negative for HCV RNA by week 12, and obtained early virological response (EVR). EVR rate was significantly higher in the patients with 4 or more mutations (91%) than in the other patients (41%)(p=0.0024). Multivariate analysis revealed that male gender was an only independent factor predicting EVR (OR=0.31, 95%CI=0.11-0.923, p=0.035). Among 36 patients in whom 6 months had passed after the end of treatment, 20 obtained SVR. Of 20 patients with SVR, 13 had more than one mutations. SVR rate was significantly higher in the patients with more than one mutations (72%) than in the other patients (39%)(p=0.0442). Multivariate analysis revealed that ISDR was an only independent factor predicting SVR (OR=3.81, 95%CI=0.84-17.26, p=0.082). Conclusions: The number of mutations in ISDR was demonstrated to be an important predictor for EVR, EVR and SVR, especially for RVR and SVR in PEG-IFN plus RBV treatment as well as in IFN mono-therapy.

Disclosures: The following people have nothing to disclose: Michihito Murao, Kyoko Kobayashi, Narumi Komura, Hiroaki Shimazaki, Takuji Nakano, Yoshifumi Nitta, Masao Harata, Naoto Kawabe, Senju Hashimoto, Kentaro Yoshioka

281
REAL-LIFE RATES OF TREATMENT COMPLETION FOR HCV
Adeel A. Butt1,2, Melissa Skanderson1, Kathleen A. McGinnis1, C. K. Kwoh1,2, Amy C. Justice3,4; 1Medicine, University of Pittsburgh, Pittsburgh, PA; 2VA Pittsburgh Healthcare System, Pittsburgh, PA; 3VA Connecticut Healthcare System, West Haven, CT; 4Yale University School of Medicine, New Haven, CT

Background: Rates and factors predicting treatment completion for HCV infection in real-life settings are unknown. Methods: We assembled a national cohort of HCV-infected veterans from 1998-2003, using the VA National Patient Care Database for demographic and clinical information, Pharmacy Benefits Management database for pharmacy records and the Decision Support Systems database for laboratory data. We studied the rates and factors predicting treatment completion for HCV. Results: For the 134,934 veterans with at least 1 inpatient or 2 outpatient codes, 16,043(11.9%) were prescribed treatment. Among the 10,641 veterans with > 1 year of follow-up, 22.5% completed a 48 week course of treatment. Non-completers were more likely to be black, have pre-treatment anemia, corona artery disease, depression and more aggregate comorbidities. In multivariable analyses, non-completion was associated with baseline anemia (OR 0.66, 95%CI 0.56-0.78 for hemoglobin 10-14mg/dl) and depression (OR 0.78, 95%CI 0.69-0.89). Pegylated interferon was associated with higher rates of treatment completion. HIV-coinfection did not affect completion rates. Conclusions: A minority of HCV-infected persons were prescribed treatment and less than one-quarter complete a 48-week course. Anemia and depression are potentially modifiable factors that must be addressed at a population level before universal use of pharmacotherapy is advocated.

Baseline characteristics of HCV infected persons who completed a 48 course of treatment for HCV, and a flow sheet of analysis for the current study

CLINICAL RELEVANCE OF RAPID VIROLOGICAL RESPONSE (RVR) IN DECOMPENSATED HCV-RELATED CIRRHOSIS TREATED WITH PEG-INTERFERON AND RIBAVIRIN
Angelo Iacobelli1, Brigidia E. Annicchiarico2, Massimo Siciliano2, Grazia Niro1, Laura Accademia1, Nazario Caruso2, Giuseppe Bambardieri2, Angelo Andriulli1, 1Gastroenterology, Hospital Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy; 2Institute of Pathology and Semeiotica Medica, Catholic University, Rome, Italy

Background: Recent studies provided positive data on the impact of HCV clearance by antiviral therapy in improving hepatic function in decompensated cirrhosis. However, low tolerability of therapy and the risk for severe infections render useful to single out those patients with a higher likelihood of achieving a sustained virological response (SVR). Aim: to determine whether in decompensated cirrhosis naïve to previous combined antiviral therapy RVR could predict SVR. Methods: 104 cirrhotics underwent treatment with peginterferon alfa-2b (1.5 mcg/kg/wk) and ribavirin (800 or 1000 mg) for 24 weeks. Patients: mean age was 62 +/- 7 yrs; 63% of patients

Abu Hassan, Asmarani Abdullah, Boon Phoe Ooi, Sanjay Rampal, Mohd Ismail Merican
were infected by geno 1/4; and 96% were staged in Child-Pugh class B. Results: SVR was achieved in 29 patients (28%), overall; 10 of them (15%) with genotype 1 or 4, and 19 (48.7%) with genotype 2 and 3 (P < 0.01). On-treatment viral clearances, according to HCV genotypes, are given in the table. At treatment week 4, 36 patients cleared HCV (RVR), and 23 of them achieved SVR (63.8%) at a significant difference between genotypes: 9 of 18 genotype 1 and 4 patients (50%), and 14 of 18 genotypes 2 and 3 (78%; P < 0.01). All RVR patients who achieved SVR had a pre-treatment viral load < 350,000 copies/mL. Conclusion: Decompensated patients with HCV-related liver cirrhosis achieve on-treatment viral clearance at different time. Achieving the RVR status may guide tailoring length of treatment. Two-thirds of patients infected by genotypes 2 and 3 may achieve SVR with a treatment length as short as 24 weeks, provided they clear HCV at treatment week 4. In non-RVR patients with the latter genotypes and in those infected by genotypes 1 and 4, the adopted duration of therapy appears insufficient to attain optimal SVR rates. The present study further supports the feasibility of antiviral treatment with Peg-interferon alfa-2b and ribavirin in Child-Pugh class B cirrhotics.

283 ANALYSIS OF GENE EXPRESSION DURING THE FIRST 10 WEEKS FOLLOWING PEG-INFERNOR-ALFA2B/RIBAVIRIN TREATMENT OF A GROUP OF HEPATITIS C PATIENTS

Milton W. Taylor1, Takuma Tsukahara2, Paul Kwo2; 1Gastroenterology & Hepatology, UTMB, Galveston, TX; 2Internal Medicine, UTMB, Galveston, TX

Our AIM was to analyze interferon gene expression following peginteron and ribavirin therapy in genotype I patients. METH-OIDS: RNA was isolated from PBMC from 20 treatment naive hepatitis C patients treated with Peg–intron /ribavirin, at time points 3, 6, 10, 13, 27, 42 and 70 days after initiation of treatment. All patients were treated with PEG interferon alfa-2b 1.5 mcg/kg QW for 10 weeks. Ribavirin was taken twice daily calculated at 13+ 2mg/kg/day. Affymetrix DNA microarrays (U133) were used to analyze gene expression of over 22,000 genes at each time point. Microarray data was analyzed with MAS 5.0, and arrays for each patient were scaled to a target intensity of 1000. Subsequent to normalization, a list of up and down regulated genes (p<0.001 and >1.5 fold) at each time point compared to baseline (Day 0) was generated.

Changes in gene expression for each patient were assessed using EDGE (http://www.biolstat.washington.edu/software/storey/edge/about.php) and was used to identify significance in genes expression in a temporal fashion. RESULTS: Approximately 300 genes were either up or down regulated on day 3 and day 10, with the number dropping to half at day 6 and day 13, prior to the next administration of interferon/ribavirin. Thus the interferon effect on gene expression attenuated with time. However a large number of genes continued to be differentially regulated up to week 10. The chemokine gene CXCL10 was induced early but not at later times. A group of genes previously identified as playing an important role in anti-viral response including OAS2, MX1, IFI44, IFIH1 were up-regulated throughout this period. Other genes such as Carbonic anhydrase-1 (CA1) and GYPA were upregulated only from days 42 and 70. Functional analysis of differentially expressed genes using Ingenuity Pathways software (Ingenuity Systems v5.0) showed that the most highly significant [-log(p-value) >11] networks and pathways modified by therapy involved genes classified as important in immune response. The intensity of the significance of gene network association with immune response attenuated from Day 3 through Day 70. Interestingly some of the genes of the JAK-STAT pathway were no longer upregulated at late times. Genes down regulated were predominantly related to ribosomal proteins and eukaryotic translation factors. By week 10, 50% of the patients demonstrated a positive response to therapy by having no detectable virus in plasma samples. Viral titers negatively correlated with the number of genes modified at specific time points. This research was approved by the Indiana University IRB, and supported by a grant from Integrated Genetics.

284 IRON DEPLETION AND RESPONSE TO INTERFERON IN CHRONIC HEPATITIS C (HCV) : A META-ANALYSIS

Rajasekharra r. Mummid1,2, Krishna S. Kasturi2, Gagan Soodd1,2; 1Gastroenterology & Hepatology, UTMB, Galveston, TX; 2Internal Medicine, UTMB, Galveston, TX

Background and Aim: Hepatic iron content is known to influence the response to interferon (IFN) in chronic Hepatitis C (HCV) patients. Several studies have reported effect of Iron depletion on response to IFN in HCV. These studies are heterogeneous in design and outcome measures. We performed a meta-analysis of available studies (1995 through May 2007). Methods .Electronic database Medline, CINHAL and Science Citation index were searched. RCTS comparing Interferon treatment (IFN) with Interferon and Phlebotomy (IFN and Phlebotomy) were chosen for the meta-analysis. Sustained Virologic Response (SVR) was the primary outcome. Sustained biochemical response (biochemical SR) and end of treatment Virologic response (ETR) were also analyzed. Data was pooled using Fixed effects (Peto odds Ratio) and Random effects (DerSimonian-Laird) method. Results: A total of 231 studies were identified among which 52 studies were selected and reviewed. The studies with known causes of iron overload (Hemochromatosis, alcohol abuse, Porphyria cutanea tarda or transfusion related overload) were excluded. There were fifteen published studies evaluating effect of IFN with phlebotomy as an adjuvant therapy. The data was extracted from 5 studies [N=334] which met the inclusion criteria (RCTS). IFN with phlebotomy compared with IFN alone increased the probability of achieving SVR (Peto OR= 2.43 95 % CI 1.41-4.16)Virologic
Efficacy of Peginterferon Alfa-2a and Ribavirin in 2101 Patients with HCV Infection in Real-Life Clinical Practice: Results of the French Hepatitis Study

Marc Bourliere, Denis Ouzan, Michel Rosenheim, Michel Doffoel, Patrick Marcellin, Jean-Michel Pawlotsky, Laurent Salomon, Francis Fagnani, Cécile Hayem, Isabelle Lonjon-Domanec, Muriel Vray, Hépato-gastroentérologie, Hôpital Saint Joseph, Marseille, France; 2Arnault Tzanck Institute, Saint Laurent du Var, France; 3Hôpital Pitié Salpêtrière, Paris, France; 4CHU, Strasbourg, France; 5Hôpital Beaujon, Clichy, France; 6Hôpital Henri Mondor, Creteil, France; 7 Louis Mourier, Colombes, France; 8Cemka-Eval, Bourg la Reine, France; 9Roche, Neuilly, France; 10Institut Pasteur, Paris, France.

Objectives: Previous studies conducted in Europe and in the US have shown similar efficacy of peginterferon alfa-2a plus ribavirin in real-world setting compared to randomized controlled trials. A nationwide observational study was also conducted in France to determine the characteristics of hepatitis C patients under treatment, histology assessment and rates of sustained virological response (SVR).

Methods: Between November 2003 and December 2004, 324 physicians recruited chronic hepatitis C patients treated with peginterferon alfa-2a (40KD). Patient demography and liver histology assessment were recorded at baseline and treatment and compliance were recorded every 3 months. Efficacy outcome was evaluated with qualitative PCR more than 3 months after the end of treatment.

Results: Among the 2101 patients analyzed, 62% were male, the mean age was 47±12 years, the mean body weight was 71±14 kg and 17% had cirrhosis. Distribution of genotypes: GT1 53%, GT2 12%, GT3 25%, GT4 8%, GT5 2%. The majority of the patients in the cohort were HCV treatment naive (70%). Liver biopsy and fibrosis markers were performed in 69% and 35% of the patients respectively but the relative proportions changed during the conduct of the study in favour of evaluating fibrosis markers. GT1 patients were biopsied more often than GT2 and 3 patients (77% and 56% respectively). The overall SVR rate was 57% (783/1377) in all patients and 63% (596/949) in naive patients. Among naive patients, SVR rate was 52% in GT1 (227/438), 80% in GT2 (115/144), 74% in GT3 (194/262), 55% in GT4 (42/76) and 59% in GT5 (10/17). Age below 40 years (p<0.001; odds ratio [OR] [95% confidence interval [CI]] = 2.4 [1.7-3.2], genotype 2 and 3 (p<0.001; OR [95% CI] = 2.7 [2.0-3.5], fibrosis less than F2 (p<0.001; OR [95% CI] = 1.7 [1.3-2.2], and naïve status (p<0.001; OR [95% CI] = 3.2 [2.2-4.6], were found to be independently associated with a higher response rate in multivariate analysis. Conclusions: This large study confirmed the efficacy of peginterferon alfa-2a plus ribavirin in the French clinical practice setting compared to randomized controlled clinical trials*. The increasing role of fibrosis markers rather than liver biopsy in the management of hepatitis C patient in France is confirmed. *Fried NEJM 2002; Hadziyannis Annals 2004.
significantly in the sustained virologic responders (16.2 to 12.6 kPa, p=0.019), but not in the nonsustained virologic responders, nor in the untreated controls. CONCLUSION: Liver stiffness measured by the Fibroscan is significantly, but modestly reduced on average at the end of follow-up in patients with chronic hepatitis C who achieve a sustained virological response to peginterferon alpha and ribavirin therapy. Longer follow-up will be necessary to assess whether the improvement subsequently continues.

**287 INHIBITION OF REPLICATION AND EXPRESSION OF HCV NSSA PROTEIN BY SMALL INTERFERING RNA**

Xiufen Su, Yanfang Jiang, Feng Wang, Junqi Niu; Department of Infectious Disease, First Hospital, Jilin University, Changchun, China

Objective: We design small interfering RNA (siRNA) targeted HCV NSSA in three different sites, in order to detect the inhibitory effect of siRNA on expression of hepatitis C virus (HCV) NSSA protein. Methods: HCV NSSA gene was amplified by polymerase chain reaction (PCR) method from pCDNA 3.1 (+) HCV NS3 45 plasmid, and cloned into pGEM-T vector through TA cloning technology, then inserted into the eukaryotic expression vector pcI-neo, construct HCV NSSA-pcI-neo eukaryotic expression vector. Three different loci pSilencerTM3.1-H1neoRNAi vectors were constructed. Conclusion: HCV NSSA-pcI-neo expression plasmids were constructed and cotransfected the vector with pcI-neo/HCVNSSA into HL-7702 cells by LipofectamineTM 2000. Inhibitory effects of three siRNA on expression of HCV NSSA protein were measured by western blots. Results: Western blots showed that expression of HCV NSSA protein in HL-7702 cells transfected by pcI-neo/HCV NSSA vector was very strong and that there had obviously inhibitory effects on expression of HCV NSSA protein in HL-7702 cells followed by cotransfecting this vector with three pSilencerTM3.1-H1neoRNAi vectors. Conclusion: The first phase viral decline in genotype 5 patients was significantly (P<0.03) more pronounced (mean 2.0 log IU/ml) than that of genotype 1 (1.2 log), and similar to that observed for genotypes 2-3 (2.3 log). Viral decline pattern in all genotype 5 patients was bi-phasic, like for genotype 2-3 patients, and did not show a transient rebound in HCV-RNA towards the end of the week before the next Peg-IFN injection, as seen in some genotype 1 patients treated with Peg-IFNα2a. The second phase decline slope was significantly (P<0.01) faster for genotype 5 (mean 1.6 log/week) than genotype 1 (0.7 log/week) and similar to that of genotype 2-3 patients (1.5 log/week). RVR (<50 IU/ml at week 4) was observed in 75% of genotype 5 patients, significantly (P<0.003) more than genotype 1 (14%) and similar to genotypes 2-3 (86%). Conclusions: HCV genotype 5 early viral kinetics are significantly more rapid than HCV genotype 1 kinetics and similar to those seen for HCV genotypes 2-3. These results may warrant clinical trials to test shorter treatment for HCV genotype 5 patients.

**289 HEPATITIS C VIRUS GENOTYPE 5: EPIDEMIOLOGICAL DATA AND RESPONSE TO TREATMENT**

Nabil Antaki1, Adnanne Hermes2, Milad Hadad2, Muad Tayeh3, Fadi Antaki4, Naaman Abdo1, Kamel Kebbewar1; 1Gastroenterology and Hepatology, St Louis Hospital, Aleppo, Syria; 2Gastroenterology, Aleksro Military Hospital, Aleppo, Syria; 3Gastroenterology, Ibn Nathif Hospital, Damascus, Syria; 4Gastroenterology, Erasme Hospital, Brussels, Belgium

Background: In Syria and the Middle-East, the most common Hepatitis C Virus (HCV) genotypes are 4 then 1. While no cases of genotype 5 have been reported from neighboring countries, we have recently reported that 10% of HCV cases in Syria are of genotype 5. The response to treatment in genotype 5 has only been described in two small and one larger case series. The presence and treatment response of HCV genotype 5 in the Middle-East have never been described yet. Aims and Methods: We present the epidemiological data and treatment outcome for all HCV genotype 5 patients evaluated at 3 medical centers in Syria between 2004 and 2006. The medical
records were reviewed retrospectively. Genotyping was performed by INNO-LIPA (Bayer Diagnostics). Treatment consisted of Ribavirin 1000-1200 mg daily plus Interferon α2a 3 MU x 3/week or Peg-interferon α2a 180µg/week. The treatment response results for the treatment-naïve patients who have completed the treatment course and the 6-month follow-up period are presented. Results: During the study period, 81 patients were diagnosed with HCV genotype 5. Mean age was 53 ± 12 years. Female to male ratio was 2:1. 91% of cases originated from one district in the northern part of Syria of which 40% are from a small city of 30,000 inhabitants. The mode of transmission (transfusion, tattooing, and IV drug) was determined in 20% only. One family (mother, 2 sons and 2 daughters) is reported confirming that intrafamilial transmission may exist. So far, 26 patients have completed a course of anti-HCV therapy. In these patients, an early viral response was achieved in 88%, an end of treatment response in 88% and a sustained viral response (SVR) in 54%. SVR was higher with Peg (66.6%) v/s IFN (47%), in patients with low fibrosis (75%) v/s advanced fibrosis (37.5%) and in patients with low viremia (69%) v/s high viremia (38%). SVR was similar in patients treated for 24 or 48 weeks. Discussion: There is no obvious cause for the high prevalence rate of HCV genotype 5 in northern Syria. Compared to genotype 4, the SVR of genotype 5 appears to be better for patients treated with IFN (47%/v/s 28%) and comparable with Peg-IFN (66%/v/s 61%). The only three published studies on the treatment outcome of HCV genotype 5 reported SVR rates of 67%, 48% and 60% in series of 12, 21 and 87 patients. Our study confirms these results. Conclusion: HCV genotype 5 does exist in the Middle East. Similar to genotype 4, the response to treatment is, intermediate between genotypes 2/3 and 1. More epidemiological and clinical studies are needed to determine the reason for the high prevalence rate in a small area and the optimal duration of therapy.

PREDICTORS OF SUSTAINED VIROLOGICAL RESPONSE TO INTERFERON-BASED TREATMENT IN HEMODIALYSIS PATIENTS WITH CHRONIC HEPATITIS C VIRUS INFECTION - A PATIENT LEVEL META-ANALYSIS

Craig E. Gordon1, Katrin Uhlig1, Joseph Lau2, Christopher H. Schmidt2, Andrew S. Levey1,2, John B. Wong2; 1Nephrology, Tufts-New England Medical Center, Boston, MA; 2Clinical Care Research, Tufts-New England Medical Center, Boston, MA

Background Hepatitis C virus (HCV) infection has a prevalence of 13% in hemodialysis (HD) patients and increases mortality. Interferon (IFN) and pegylated-interferon (PEG-IFN) may eradicate HCV infection. We studied predictors of sustained virological response rate (SVR) to IFN in HD patients with HCV. Methods After performing a systematic review of IFN and PEG-IFN treatment in HCV-infected HD patients published between 1966 and December 2006, we extracted individual patient data (IPD) from included articles and acquired additional data by contacting study authors. We used univariate and multivariate logistic regression to identify predictors of SVR. Results Twenty studies of IFN monotherapy with 461 patients met inclusion criteria and provided IPD for 428 patients. Three studies of PEG-IFN involved 38 patients but did not supply IPD. The overall SVR was 41% (95% CI, 33-49%) with IFN and 37% (977%) with pegylated-IFN (PEG-IFN). Factors associated with statistically significantly higher SVR with IFN using IPD included: 3 MU or higher dose three times weekly (OR 3.3, 1.2-9.1), intended treatment duration of at least six months (2.0, 1.1-3.9), treatment completion (4.1, 2.4-6.8), lower HCV RNA at baseline (3.6, 1.9-6.7 per log10 lower RNA), and female gender (2.1, 1.3-3.4). Early virological response (EVR), measured as HCV RNA negativity 1-3 months into treatment, was also associated with significantly higher SVR (5.1, 2.6-10.0). HCV genotype 1 and cirrhosis were not associated with SVR. Despite limitations involving missing and clustered data, multivariate analysis documented independent associations of SVR with dose, duration, treatment completion, HCV RNA, and female gender. Conclusions HCV treatment in HD patients resulted in an overall SVR of 41% with IFN and 37% with PEG-IFN. SVR is higher in women, with low baseline HCV RNA, or with early virological response, and with IFN antiviral therapy at 3 MU for at least 6 months and completion of intended treatment duration.

291
BEZAFIBRATE TREATMENT FOR CHRONIC HEPATITIS C AFTER FAILURE OF PREVIOUS COMBINATION THERAPY WITH INTERFERON AND RIBAVIRIN

Viola Weich, Beate Schlosser, Juliane Halangk, Alexandra Bergk, Florian van Bömmel, Thomas Berg; Charite, Campus Virchow Klinikum, Berlin, Germany

Lipoproteins have been reported to be involved in the infection cycle of hepatitis C virus. Former studies from Japan could demonstrate a significant reduction of liver enzymes and viral load after treatment with the lipid lowering agent bezafibrate. Bezafibrate exerts multiple effects on lipid metabolism by activating the peroxisome proliferator-activated receptor-alpha (PPAR-α) which modulates the expression of key genes of lipid transport, hepatic fatty acid and lipoprotein metabolism as well as inflammation. The aim of the present observational study was to assess the efficacy and safety of bezafibrate monotherapy in patients with advanced chronic hepatitis C who failed previous combination therapy with peg-interferon alpha and ribavirin. Patients and Methods: 34 patients from our university hospital [mean age 61 years, HCV type 1 [n=33], HCV type 4 [n=1], compensated cirrhosis [n=16], advanced fibrosis [n=18]] received daily oral bezafibrate treatment (400 mg per day) on the basis of a prospective observational open-label study design. Clinical, biochemical and virological data were evaluated during a mean treatment duration of 12 months (range 2-49 months). Results: Three patients dropped out of the study complaining about vertigo or palpitations within the first days of treatment. In the remaining 31 patients no significant adverse events were observed. During the treatment course, a significant improvement in gamma-glutamyl transpeptidase levels (GGT) as well as alanine aminotransferase levels (ALT) could be demonstrated in all patients. In 3 patients liver enzymes normalized completely. The mean GGT levels decreased from 171±119 to 107±100 IU/l (p<0.001), and the mean ALT levels from 108±70 to 80±47 IU/l (p<0.025).The mean AST levels at baseline and at the end of observation were 91 ± 44 IU/l and 88 ± 33 IU/l (p= n.s.). No significant effect on viral load was observed (mean HCV RNA level at baseline was 5.81 log10 IU/mL ± 0.46 and at the end of observation 5.9 log10 IU/mL ± 0.48, p=n.s.). Only one patient showed viral decline of 1 log after 11 months of treatment. Conclusion: This observational study provides evidence that bezafibrate is effective for patients with chronic hepatitis C by reducing significantly ALT.
and GGT levels and could be therefore a therapeutic option, especially for those, in whom peg-interferon combination treatment was previously unsuccessful. Further larger and randomized clinical trials including also histological endpoints are required to confirm these findings.

### 292 IMPACT OF ANTIVIRAL TREATMENT ON NON-INVASIVE PREDICTORS OF LIVER FIBROSIS IN PATIENTS WITH CHRONIC HEPATITIS C

Stella M. Martinez1, Guillermo Fernandez-Varo2, Marlene Dominguez1, Ramon Bataller1, Ellen Sampson3, Wladimiro Jimenez2, José M. Sánchez-Tapias1, Xavier Forns1,1Liver Unit, Hospital Clinic. IDIBAPS., Barcelona, Spain; 2Biochemistry and Molecular Genetics, Hospital Clinic. IDIBAPS., Barcelona, Spain; 3Siemens Medical Solutions, Siemens, Tarrytown, NY

Background: Histologic improvement following interferon-based antiviral treatment has been demonstrated in patients with chronic hepatitis C (CHC) achieving viral clearance. The aim of this study was to evaluate the changes in non-invasive markers of liver fibrosis in a large cohort of patients with CHC treated with pegylated interferon and ribavirin. Methods: The study included 130 patients who underwent pegylated interferon and ribavirin treatment. All patients had a baseline liver biopsy (fibrosis scored by the Scheuer classification) and the following fibrosis markers were evaluated at baseline and 6 months after treatment completion: hyaluronic acid (HA), collagen IV (Col4), amino-terminal propeptide of type III collagen (PIIINP), tissue inhibitor of matrix metalloproteinase 1 (TIMP-1), and 4 Marker algorithm (PIIINP, TIMP-1, Col4 and HA) (Rosenberg et al. Gastroenterol 2004). The diagnostic performance of both algorithms for diagnosis of significant liver fibrosis (F2) and cirrhosis (F4) was evaluated at baseline by the area under the ROC curve (AUROC). Results: A total of 55 patients (42.3%) were nonresponders (NR) whereas sustained virological response (SVR) was achieved in 75 patients (57.7%). The AUROC values for F2 were 0.807 and 0.806, and for F4 were 0.810 and 0.804, with ELF Scheuer and 4 Marker algorithms, respectively. Baseline and post-treatment algorithm values in relation to SVR are shown in table 1. In patients who achieved SVR the values of both algorithms decreased significantly from baseline, whereas in non responders there was no change. Conclusions: Serum fibrosis markers can identify the presence of significant fibrosis and cirrhosis accurately in a significant proportion of patients. Moreover, virological clearance is associated with a significant reduction in fibrosis serological markers, which most likely reflect the histological improvement associated with sustained virological response. If confirmed, the latter would support the use of non-invasive markers to follow-up patients with CHC.

### 293 EARLY REDUCTION OF RIBAVIRIN LEADS TO RETARDATION OF VIRAL CLEARANCE AND AFFECTS SVR

Yoshiyasu Karino1, Jouji Toyota1, Tomohiro Arakawa1, Yasuaki Kuwata1, Jun Akaike1, Katsu Yamazaki1, Takahiro Sato1, Takumi Omura1, Shiro Iino2, 1Hepatology, Sapporo Kosei General Hospital, Sapporo, Japan; 2Hepatology, Kiyokawa Hospital, Tokyo, Japan

Background: It is said a reduction of ribavirin (RBV) will not impact the SVR rate, but no examination has included the effect of the timing of the reduction of RBV while it is known that the timing of HCV RNA loss strongly relates to the SVR rate. Aim: To review the antiviral activity of RBV from the effect of the timing of reduction of RBV on the timing of HCV RNA loss. Methods: One hundred and twenty-four patients with genotype 1b and high viral load (62 males, 62 females; mean age 55.9 years old) who received PEG IFNα-2b plus RBV combination therapy for 48 weeks were included in analysis. All patients received RBV by a total clearance of RBV (CL/F)-based dose (we set 2250ng/ml as target blood concentration and calculated the dose of RBV from CL/F, 2005AASLD). The dose of PEG IFNα-2b of 1.5µg/kg/week was not reduced for the duration of administration. We determined the factors affecting the timing of HCV RNA loss in patients for whom RBV was not reduced (group A) by multiple regression analysis and prepared of a predictive formula. Applying this predictive formula to patients in whom RBV was reduced, we examined whether the timing of RBV reduction affects the timing of HCV RNA loss. Results: Predictive formula based on multiple regression analysis was: Estimated time of HCV RNA loss (week) = 1.8960 x Log HCV RNA (2W) + 8.5722, where HCV RNA (2W) is HCV RNA level (KIU/ml) 2 weeks after the start of treatment. This predictive formula allowed the good prediction of the actual timing of HCV loss. When applied to patients with RBV reduced after 8 weeks of treatment (group B) and in the first 8 weeks of treatment (group C), the fit was 100% (group B) and 69% (group C) that of the actual timing of HCV RNA loss with less than +/-4 weeks of predicted. With patients showing greater than +/-4 weeks difference between predicted and actual timing of HCV RNA loss (group C), the actual timing was delayed from the predicted time. In other words, delay in HCV RNA loss was statistically significant compared to without RBV reduction in patients with early RBV reduction. SVR rate with group A, B, and C was 60%, 62.5%, and 38.5%, respectively, and reflected the difference in the timing of HCV RNA loss. Conclusions: We reviewed patients with genotype 1 and high viral load with and without RBV dose reduction and correlation with the timing of HCV loss. Because HCV RNA loss was delayed in patients for whom RBV was reduced early in treatment, it was thought that antiviral activity of RBV was expressed from a relatively early stage in IFN + RBV combination therapy. A method of administration to avoid reducing RBV is important to increase the SVR rate.

294 INTRACELLULAR TARGETING OF HEPATITIS C VIRUS CORE PROTEIN WITH A SINGLE CHAIN ANTIBODY
Raiki Machida1, Tobias Heintges2, Shuping Tong1, Jisu Li1; 1Liver Research Center, Rhode Island Hospital and The Warren Alpert Medical School of Brown University, Providence, RI; 2Gastroenterology, Hepatology and Infectious Diseases, Heinrich-Heine University, Dusseldorf, Germany

Background and Aims: The hepatitis C virus (HCV) core protein is not only essential for viral genome encapsidation but also implicated in pathogenesis such as steatosis and cell growth regulation. We previously found that expression of HCV core protein increased cell proliferation, DNA synthesis, and cell cycle progression. The acceleration of cell growth was mainly attributable to the activation of HGF (hepatocyte growth factor) and Wnt-1 signaling, pathways that are frequently activated in human HCC samples. In the present study, we evaluated the effect of an intracellular single chain antibody on core protein level and cell growth. Methods: The human single chain Fv antibody fragments were cloned from bone marrow of patients with chronic hepatitis C. The antibody targeting the HCV core protein was selected by affinity binding/purification, and subcloned into the expression vector. The epitope recognized by this antibody is conserved among different HCV genotypes. The effect of the antibody on core protein expression was evaluated by co-transfecting the antibody construct with the core expression construct or the replicon RNA into Huh-7 cells. Results: Co-transfection of the antibody construct with the core protein cDNA markedly reduced core protein level, and inhibited cell proliferation. In contrast, proliferation of cells transfected with the core-null mutant or empty vector was not modulated. Moreover, the antibody construct could also reduce core protein expression from the full-length HCV replicon (JFH1), as evidenced by immunofluorescence staining and Western blot, indicating the ability of the antibody to recognize core protein translated as part of HCV polyprotein. Conclusion: The single chain antibody can efficiently target HCV core in the context of HCV replication and reverse core protein mediated cell proliferation. Further studies will elucidate whether the single chain antibody down regulates core protein abundance/function through degradation and/or steric inhibition. It may represent a novel agent to interrupt the HCV life cycle and to blunt pathogenesis mediated by the core protein.

295 TREATMENT UPTAKE AND OUTCOMES AMONG CURRENT AND FORMER INJECTION DRUG USERS (IDUS) RECEIVING DIRECTLY OBSERVED THERAPY WITHIN A MULTIDISCIPLINARY GROUP MODEL FOR THE TREATMENT OF HEPATITIS C VIRUS (HCV) INFECTION
Krista Genoway1,3, Jason Grebely1,3, Fiona Duncan2, Mark Vlijmen3, Lesley Gallagher1,3, Doug Elliott3, Milan Khara2, Jesse D. Raffa2, Stanley deVlaming3, Brian Conway1,3; 1Anesthesiology, Pharmacology and Therapeutics, University of British Columbia, Vancouver, BC, Canada; 2Statistics and Actuarial Science, University of Waterloo, Waterloo, ON, Canada; 3Pender Community Health Centre, Vancouver Coastal Health, Vancouver, BC, Canada

Purpose: We evaluated HCV treatment uptake and outcomes among current and former IDUs attending a weekly peer-support group and receiving directly observed HCV therapy (DOT). Methods: Beginning in March 2005, patients interested in receiving treatment for HCV infection were referred to a weekly peer-support group and evaluated for treatment. Utilizing the existing infrastructure for addiction disease management, we have developed a model whereby the treatment of addiction, HCV and other medical conditions are integrated under the DOT model of care. Patients received directly observed therapy with pegylated interferon alpha 2a or alpha 2b (PEG-IFN alpha 2a or alpha 2b), both in combination with self-administered ribavirin (RBV). Results: Overall, 129 subjects were referred to the support group over a period of 108 weeks, with the mean attendance being 15 subjects per week (range 3-32). Overall, 10 (8%) did not medically qualify for treatment, 39 (30%) were lost to follow-up and 8 (6%) had completed or initiated treatment for HCV infection prior to attending the group. We observed a high uptake of HCV treatment among attendees, with 30% of subjects (39/129) currently under evaluation and 26% (33/129) having initiated or completed treatment for HCV infection. In a comparison of subjects that had initiated or completed treatment for HCV infection (n=33) and those lost to follow up (n=39), those having received treatment for HCV infection had a higher median attendance (34 meetings [Interquartile range, IQR = 11-33] vs. 2 meetings [IQR=1-3, P<0.001]) and were more likely to attend >3 clinic visits (97% vs. 23%, P<0.001) than those lost to follow up. To date, 31 patients (PEG-IFN alpha 2a/RBV = 15; PEG-IFN alpha 2b/RBV = 4) have initiated treatment for HCV infection at our site and 18 have completed therapy, with 67% (12/18) of subjects achieving an end of treatment response (Genotype 1 – 40%, Genotypes 2-100%, Genotype 3 – 67%), despite ongoing drug use in 72% of patients during treatment. Conclusion: These data demonstrate that with the appropriate programs in place, a high uptake of HCV treatment can be achieved among IDUs referred to a peer-support group. Moreover, the treatment of HCV in current and former IDUs within a multidisciplinary DOT program can be successfully undertaken, resulting in end of treatment responses similar to those reported in randomized controlled trials.

296 INFREQUENT HEPATITIS C VIRUS (HCV) RE-INFECTION AFTER SUSTAINED VIROLOGICAL RESPONSE (SVR) AMONG CURRENT AND FORMER INJECTION DRUG USERS (IDUS) HAVING RECEIVED TREATMENT FOR HCV INFECTION
Jason Grebely1,3, Jesse D. Raffa2, Krista Genoway1,3, Grey Shover4, Fiona Duncan2, Mark Vlijmen3, Milan Khara2, Stanley deVlaming3, Chris Fraser5, Brian Conway1,3; 1Anesthesiology, Pharmacology and Therapeutics, University of British Columbia, Vancouver, BC, Canada; 2Department of Statistics and Actuarial Science, University of Waterloo, Waterloo, ON, Canada; 3Pender Community Health Centre, Vancouver Coastal Health, Vancouver, BC, Canada; 4Cool-Aid Community Health Centre, Victoria, BC, Canada

Purpose: To evaluate HCV re-infection following SVR among IDUs having received directly observed IFN alpha-2b or PEG-
IFN alpha-2a/b in combination with self-administered ribavirin in a directly observed therapy program. Methods: Viremic HCV-infected IDUs, with ALT > 1.5x ULN, received 24 or 48 week therapy (based on HCV genotype) with ribavirin and interferon alpha-2b, replaced by PEG-interferon alpha-2a/2b. Following treatment, subjects were encouraged to return to the clinic at follow-up intervals of ~1 year and were asked about their use of illicit drugs. HCV RNA testing by PCR was performed and positive results were genotyped. Results: Overall, 28/51 subjects (55%) receiving IFN alpha-2b (n=12), Peg-IFN alpha-2b (n=32) or PEG-IFN alpha-2a (n=7) achieved an SVR. Illicit drugs were used by 21/51 (41%) in the 6 months preceding therapy and by 29/51 (57%) during therapy. In total, 28 subjects were followed for a mean of 1.1 years (range, 0-3.2 years) following SVR. In this period, 13/28 (46%) reported using illicit drugs [3 – injection heroin/cocaine and crack cocaine, 2 – injection heroin and crack cocaine, 1 – injection cocaine and crack cocaine, 3 – injection cocaine, 2 – injection heroin, 2 – crack cocaine]. Eleven subjects (39%) reported injection drug use. Overall, 25/28 (89%) remained HCV RNA negative, 1 died of hepatocellular carcinoma, 1 was lost to follow-up and 1 was positive for HCV RNA. This subject received 17 weeks of Peg-IFN alpha-2b therapy and had viral reoccurrence with the same genotype (G1), consistent with re-infection or viral relapse. Therefore, viremia re-occurred in 1/28 (3.6%), providing an estimated rate of re-occurrence of 4.0 cases per 100 person-years. Conclusions: These data demonstrate a low rate of HCV re-infection among IDUs successfully treated for HCV and provides a rationale for expanding treatment in this group. Research is required to understand if this is associated with protective immunity against HCV re-infection or reduced risk behaviors for acquisition following successful treatment.

297 PEGYLATED INTERFERON ALFA-2B PLUS RIBAVIRIN REDUCES INSULIN RESISTANCE AND IMPROVES GLUCOSE METABOLISM IN PATIENTS WITH CHRONIC HEPATITIS C

Masaaki Korenaga1, Keiko Korenaga1, Kouichi Uchida1, Takahiro Yamasaki1, Keisuke Hino1, Isao Sakaia1; 1Department of Gastroenterology & Hepatology, Yamaguchi University graduate school of medicine, Ube, Japan; 2Basic Laboratory Sciences, Yamaguchi University graduate school of medicine, Ube, Japan

Background: Hepatitis C Virus (HCV) infection is linked to insulin resistance which may contribute to fibrogenesis and carcinogenesis in chronic hepatitis C. Glucose intolerance setting of chronic HCV infection could be related etiologically to viral factors. However, IFN has been reported to acutely induce insulin resistance and glucose intolerance. Although HCV is a candidate for the development of insulin resistance, the effects of antiviral treatment on impaired glucose metabolism remain unclear. The aim of this study was to clarify whether insulin resistance was improved on Pegylated Interferon alfa-2b Plus Ribavirin (PegIFN/RBV). Methods: Plasma glucose (PG) level and immunoreactive insulin (IRI) level in the course of 75g oral glucose tolerance test (OGTT) were measured to evaluate glucose intolerance in 0, 4 and 12 weeks after initial PegIFN/RBV. The OGTT was performed after an overnight fast, and blood samples were taken at 0, 30, 60, 90 and 120 min following glucose ingestion. Then PG area under the curve (AUC-G), IRI area under the curve (AUC-IR) and HOMA-IR were calculated. Simultaneously, oxidation rate of carbohydrate (%CHO), fat (%FAT) and nonprotein respiratory quotient (npRQ) were calculated by using an indirect calorimeter. Results: We examined 25 biopsy-proven patients who received PegIFN/RBV. Twelve patients (48%) were found to have diabetes while five (20%) showed impaired glucose tolerance (IGT) at the pretreatment according to OGTT as based on the revised diagnostic criteria of the American Diabetes Association (1997). In the patients of diabetes and IGT (n=17), the AUC-G was significantly decreasing (0w: 582±33 4w: 453±22; p<0.05) at week 4. Although HOMA-IR did not change at week 12 (0w: 2.4±0.3, 12w: 2.3±0.5), the AUC-IR was decreased (0w: 212±25, 12w: 158±20; p<0.05). The %CHO increased (0w: 40±4, 12w: 50±6) and %FAT decreased (0w: 47±4 12w: 36±5), as a result, npRQ increased (0w: 0.837±0.015, 12w: 0.871±0.017; p<0.05) at week 12. No one shows severe weight loss (5% down at pretreatment) and patients with normal glucose tolerance did not change by week 12. Finally, patients with glucose intolerance were divided into two groups by IFN response: Eleven were under detectable in HCVRNA at week 12 as an EVR group and six were non EVR group. The AUC-G and AUC-IR were reduced by 35% (p<0.05) in EVR. However, the AUC-I did not change in nonEVR, although the AUC-G was decreased by 17%. Conclusions: Insulin resistance and energy metabolism improved by the administration of PegIFN/RBV, which had strongest effect against HCV. The effects of rapid viral reduction might be important for restoring of glucose tolerance in chronic hepatitis C.

298 WHOLE-BODY, NOT ONLY LIVER, INSULIN SENSITIVITY IS STRONGLY ASSOCIATED WITH AN EARLY AND SUSTAINED VIROLOGIC RESPONSE TO PegIFN/ RBV PLUS RIBAVIRIN TREATMENT IN PATIENTS WITH CHRONIC HEPATITIS C GENOTYPE 1B AND HIGH VIRAL LOAD

Toshikazu Mizaota, Yuichiro Eguchi, Yasunori Kawaguchi, Keisuke Ario, Hirokazu Takahashi, Shinni Iwane, Noriko Oza, Iwata Ozaki; Internal Medicine, Saga Medical School, Saga, Japan

Aim: Recent studies have indicated that insulin resistance (IR) might be an important factor associated with the virologic response to interferon treatment for chronic hepatitis C, but little is known about its mechanism. IR consists of hepatic IR (central IR) and muscle IR (peripheral IR). We analyzed the effect of hepatic and whole-body (hepatic + muscle) IR on the efficacy of peginterferon plus ribavirin treatment. Methods: Forty-three chronic hepatitis C patients with genotype 1b and high viral load treated with peginterferon alpha-2b plus ribavirin for 48 weeks were examined. Early virologic response (EVR) and sustained virologic response (SVR) were obtained in 22 patients (51%) and 18 patients (42%), respectively. We used two methods to evaluate IR; HOMA-IR, a marker of hepatic IR, and the ISI composite, which indicates whole-body insulin sensitivity and is calculated as 10000/VFG × FRI × mean BS (0-120) × mean IRI (0-120) from a 75 g oral glucose tolerance test. Serum adiponectin levels were measured and visceral fat areas at the
umbilical level were evaluated by computed tomography. We analyzed whether the HOMA-IR and ISI composite values before treatment were associated with EVR or SVR Results: There were significant differences in HOMA-IR and ISI composite values before treatment between EVR and non-EVR patients (HOMA-IR: 1.7 vs 3.0, p=0.0005; ISI composite: 5.7 vs 3.3, p=0.02). Similarly, there were significant differences in both between SVR and non-SVR (HOMA-IR: 1.6 vs 2.8, p=0.009; ISI composite: 6.0 vs 3.4, p=0.003). Analyzed according to HOMA-IR classes, EVR and SVR rates were 76% and 62% in <2 (n=21), 32% and 26% in 2-4 (n=19), 0% and 0% in >4 (n=3), respectively. According to ISI composite classes, EVR and SVR rates were 20% and 13% in <3 (n=15), 60% and 45% in 3-6 (n=20), 100% and 80% in 6-9 (n=5), 67% and 100% in >9 (n=3), respectively. A positive predictive value for EVR and SVR when ISI composite was >6 was 87.5% for both. Multivariate analysis showed that >6 in ISI composite was the only factor associated with SVR. ISI composite values were significantly positively correlated with serum adiponectin levels and negatively with visceral fat areas. Conclusions: Whole-body, predominantly liver and skeletal muscle, insulin sensitivity is strongly associated with the efficacy of peginterferon plus ribavirin treatment. These data suggest that lifestyle interventions might enhance the effect of antiviral therapy in patients with chronic hepatitis C.

329 EVALUATION OF A MULTIDISCIPLINARY SUPPORT PROGRAM IN HEPATITIS C TREATMENT

Montserrat Garcia-Retortillo1, Maria Dolors Giménez1, Carme Máquez1, Pere Castellvi1, Ricard Naviné2,3, Eduard Clot4, Isabel Cirera1, Esther Salas4, Rocío Martin-Santos2,3, Ricard Solà1; 1Liver Section, Hospital del Mar, Universitat Autònoma de Barcelona, Barcelona, Spain; 2Servei de Psiquiatría, Hospital del Mar, Barcelona, Spain; 3Unitat d’Investigació en Farmacologia, Institut Municipal d’Investigació Mèdica, Barcelona, Spain; 4Servei de Farmàcia, Hospital del Mar, Barcelona, Spain

Adherence to antiviral treatment has been cited as a potentially important factor in determining the outcome of therapy in hepatitis C patients. Aim: To evaluate the multidisciplinary support program (MSP) efficacy and its impact on the health-related quality of life (HQL) during HCV treatment. Method: One hundred eighty-eight HCV naive patients were consecutively treated in the Liver Section of the Hospital Mar: Group 1, 91 patients included in the MSP (2005), and Group 2, 97 patients with conventional control (2003-2004). All patients were treated with Peg-IFN alpha-2a and ribavirin (RBV). The MSP team includes hepatologists, nurses, a pharmacist, a psychologist and a psychiatrist. Uniform patient informing, open and flexible visits scheduling, continued evaluation of psychiatric risk (PHQ and HADS), active medication control, and standardized management of the secondary effects were carried out during MSP. Patients receiving ≥ 80% of each assigned drug for ≥ 80% of the expected duration therapy were considered as adherent to the treatment. HQL was evaluated by SF-36 before and at 1, 3, and 6 months during treatment. Results: No differences were observed between either group in terms of age, gender, HCV-genotype, viral load and fibrosis degree. Anti-depressives or anxiolytics were prescribed in 34 (37.4%) and 21 (21.6%) patients in each group, respectively (P 0.02). Patients in Group 1 showed better scores in all domain scales of health status than the patients in Group 2. However, the differences only reached statistical significance in terms of bodily pain, and in general and mental health scores. Conclusions: The multidisciplinary support program (MSP) increases the adherence to the antiviral therapy and improves the perception of the quality of life during treatment.

300 THE TGF-β CODON 19 T/C AND 25 G/C POLYMORPHISMS AFFECTS RESPONSE TO INTERFERON-THERAPY IN ACUTELY HCV-INFECTED HIV-POSITIVE PATIENTS

Jacob Nattermann, Martin Vogel, Hans Dieter Nischalke, Golo Ahlenstiel, Monika Schulz, Tilman Sauerbruch, Jürgen K. Rockstroh, Ulrich Spengler; Internal Medicine I, University of Bonn, Bonn, Germany

Background: Co-infection with the Hepatitis C virus (HCV) in HIV-positive patients is an emerging health problem. Recently, outbreaks of acute hepatitis C (HCV) infections have been reported among HIV-seropositive homosexual men in Amsterdam, London, Paris and Berlin. The factors that predispose some individuals to treatment failure are poorly understood but may involve host genetic factors. Recently, HCV NS5A induced inhibition of TGF-β signaling has been suggested as a potential mechanism involved in HCV pathogenesis. TGF-β is a multifunctional cytokine that displays gene polymorphisms (TGF-β codon 10 T/C and codon 25G/C) associated with differential cytokine secretion. Here, we studied whether the TGF-β gene polymorphisms affects the response to antiviral treatment in acutely HCV-infected HIV positive subjects.

Methods: TGF-β genotypes were determined in 52 HIV-positive patients with acute hepatitis C treated with pegylated interferon-alpha. Genotypes were classified into high and low-intermediate producers. Rates of sustained virological responses (SVRs) were compared between the carriers of the respective cytokine genotypes. As a control 100 healthy subjects were studied.

Results: TGF-β genotype distribution did not differ significantly between HCV/HIV co-infected and healthy individuals. SVR were achieved in 67.3% (35/52) patients, respectively. Carriers of the TGF-β "high producer" genotype had significantly higher SVR rates than patients with a TGF-β "low-intermediate producer" genotype (75% [31/41] vs. 36.4% [4/11]; p=0.027). In a forward-conditioned stepwise regression model TGF-β "high-producer" genotype could be confirmed as an independent positive predictor for SVR in interferon-alpha therapy (Odds ratio: 11.2; 95%CI: 1-125; p=0.027).

Conclusions: Response rates to interferon-alpha therapy are enhanced in acute HCV-infected HIV-positive patients carrying the TGF-β "high producer" genotype. This finding may indicate that a TGF-β "high-producer" state can partially compensate HCV NS5A-induced inhibition of TGF-β signaling.
301 THE IMPACT OF STEATOSIS AND STEATOHEPATITIS ON THE RESPONSE TO TREATMENT IN PATIENTS WITH CHRONIC HEPATITIS C INFECTION

Timothy J. Cross, Alberto Quaglia, Jonathon Nolan, Ian Fletcher, Kosh Agarwal, Philip M. Harrison; Institute of liver studies, Kings college hospital, London, United Kingdom

Background: The impact of steatosis on sustained virological response (SVR) in patients treated with pegylated interferon and ribavirin for chronic hepatitis C (CHC) infection is controversial. Aims: We studied whether finding steatosis with or without steatohepatitis on a pre-treatment liver biopsy (LB) influenced SVR in patients with CHC subsequently treated with pegylated interferon and ribavirin. Patients: We assessed 204 consecutive patients treated for CHC between January 2001 and January 2005. LB was performed in all patients before treatment. The method described by Ishak was used to grade necro-inflammation and stage fibrosis. Steatosis and steatohepatitis were graded using the modified Brunt score. Patients were classified according to the presence or absence of steatosis and steatohepatitis. Patients achieving SVR were labeled as responders and those failing to achieve SVR as non-responders Results: 179 patients were included in the final analysis after exclusions; 72% male, median age 46 years (interquartile range 40 – 52). 127 patients had Ishak Fibrosis stage 3 or less (71%), and 31 patients (17.3%) were cirrhotic (Ishak stage 5-6). 106 patients were responders (59%); the SVR rates by genotype were: genotype 1 (35%), genotype 2 (82%), genotype 3 (79%), and genotype 4 (57%). 98 patients had steatosis (51.9%). The X2 test for trend demonstrated different rates of steatosis between the genotypes (P=0.14). Steatosis was most prevalent in genotype 4, 6/7 (86%), although the numbers were small. Genotype 3 had a high level of steatosis 34/54 (63%, p=0.053) and genotype 2 had a low level, 12/37 (32%, p=0.008). Steatohepatitis was present in 34 patients (19%), who were older (49 years vs. 44 years, p=0.03) and more likely to have severe steatosis (grade 2-3 vs. 0-1, p=0.0001), and cirrhosis (p=0.001). Genotype had no effect on the likelihood of steatohepatitis (p=0.69). Responders did not differ from non-responders in respect to gender, age, the presence or severity of steatosis, necroinflammatory grade or pre-treatment ALT. In a univariate analysis, reduced SVR was associated with genotypes 1 and 4 (p<0.0001), cirrhosis (p=0.0001), steatohepatitis and heavier patient weight (both p<0.009). But on multivariate analysis only genotypes 1 and 4 (p<0.001), pretreatment weight (p=0.002) and cirrhosis (p=0.06) were found to be associated with SVR. Conclusion: In CHC, steatosis has no effect on SVR. Steatohepatitis is associated with severe steatosis and liver disease progression but not SVR, which is mainly determined by genotype, patient weight and the presence of cirrhosis.

Disclosures: The following people have nothing to disclose: Timothy J. Cross, Alberto Quaglia, Jonathon Nolan, Ian Fletcher, Kosh Agarwal, Philip M. Harrison.
Rapid virological response at week 4 is the best predictor of treatment outcome in patients with chronic hepatitis C: A multivariate analysis

Michelle Martinot-Peignoux1, Sarah Maylin1, Rami Moucari2,1, Marie Pierre Ripault1, Nathalie Boyer2, Nathalie Giuily2, Corinne Castelnau2, Patrick Marcellin2,1

1INSERM U773-CRB3 Université Paris VII, Hopital Beaujon, Clichy, France; 2Service d’Hépatologie, Hopital Beaujon, Clichy, France

It is well established that HCV genotype and baseline HCV-RNA are good predictors of sustained virological response (SVR) in selected patients included in clinical trials of pegylated interferon alpha (PEG-IFN)+ribavirin (RBV). Limited knowledge is available on predictors of SVR in the general population managed in routine clinical practice. Methods: 408 patients consecutively treated with PEG-IFN α2b+RBV, were studied (221 naïves; 125 non-responders (NRs); 62 relapsers (RRs). Patients with genotypes 1 or 4 and non-naïve were treated 48 weeks and patients with genotypes 2 or 3 were treated 24 weeks (PEG-IFN 1.5µg/kg/week; RIBA 800-1200 mg/day). Serum HCV-RNA was measured at baseline, week 4, week 12, end of treatment and 6 months after the end of treatment with the quantitative VERSANTR HCV 3.0 Assay (bDNA)(Siemens). Samples below limit of quantification were tested with VERSANTR HCV RNA Qualitative Assay (TMA)(Siemens). SVR was defined as undetectable serum HCV-RNA by TMA at the end of 6-month post-treatment follow-up. The characteristics included in the logistic regression analysis were: baseline viral load (≤400 10^3 IU/ml; >400 10^3 IU/ml), HCV genotype (1, 2, 3, 4, 5), gender, age (≤55 vs >55), histology grade (A0-A naive vs A2-A3), fibrosis stage (F0-F1 vs F2-F3) assessed with Metavir score, serum ALT, pre-treatment status, rapid virological response at week 4 (RVR4)(TMA undetectable) and rapid virological response at week 12 (RVR12) (>2 log viral drop) of therapy. Early viral kinetic was analyzed at weeks 1 to 4 in a subgroup of 78 patients. Results. Overall SVR rate was 46%; SVR rates were 53%, 25% and 65% in naïves, NRs and RRs, respectively. In the overall population factors significantly associated with SVR odds ratio (95%CI) were: RVR4: 26.4(6.1-114.4)(p<0001), age 2.6(1.3-5.2)(p=0.005) fibrosis 2.1(1.01-4.40)(p=0.04). Non-RVR12 was significantly associated with non-response 51.2(6.7-538.7)(p<0001). In naïve patients RVR4: 16.2(3.3-79)(p=0.001), age 3.2(1.2-8.7)(p=0.001) fibrosis 3.9(1.2-12.3)(p=0.001) were significantly associated with SVR. In non-responders only non-RVR12 16.9(2.1-132)(p=0.007) was significantly associated with non-response. The slopes of early viral kinetics were significantly different in SVR and in non-SVR patients (p<0001), the slopes were not different in naïves and experienced patients who developed SVR. Conclusions. RVR at week 4 of therapy is the strongest independent factor for prediction of SVR. Non-EVR at week 12 is the strongest predictor of non-SVR. Therefore, monitoring of therapy should include both, detection of serum HCV RNA at week 4 with a sensitive assay (TMA) to predict SVR and quantification of HCV RNA at week 12 to predict non-SVR.

304 ASSESSMENT OF BOTH VIROLOGICAL RESPONSE AT WEEK 4 AND AT WEEK 12 OPTIMIZES PREDICTION OF TREATMENT OUTCOME IN PATIENTS WITH CHRONIC HEPATITIS C TREATED WITH PEGINTERFERON ALFA-2B PLUS RIBAVIRIN

Michelle Martinot-Peignoux1, Sarah Maylin1, Marie Pierre Ripault1, Rami Moucari2,1, Nathalie Boyer2, Nathalie Giuily2, Corinne Castelnau2, Patrick Marcellin2,1

1INSERM U773-CRB3 Université Paris VII, Hopital Beaujon, Clichy, France; 2Service d’Hépatologie, Hopital Beaujon, Clichy, France

Pretreatment viral load is an important predictor for treatment outcome in patients with chronic hepatitis C. Recently, Zeuzem et al. (AASLD 2006) proposed 400 000 IU/ml (assessed with the COBAS TaqMan HCV assay) as the optimal cut-off to best discriminate low and high VL, based on the probability to achieve SVR in patients treated with peginterferon (PEG-IFN) alpha 2a+ribavirin (RBV). Our study aimed to analyze the positive predictive value (PPV) of this cut-off value at baseline, the PPV of rapid virological response at week 4 (RVR4) and the negative predictive value (NPV) of non early virological response at week 12 (non-EVR12), in patients treated with PEG-IFN alpha 2b+RBV. Patients-Methods: 408 patients (221 naïve; 187 non-naïve) consecutively treated with PEG-IFN alpha 2b+RBV (PEG IFN 1.5µg/kg/week plus RIBA 800-1200 mg/day according to weight), were included in this study. Patients with genotypes 1, 4 or 5 or non-responders were treated 48 weeks; naïve patients infected with genotypes 2 or 3 were treated 24 weeks. Serum HCV RNA was measured at baseline, week 4, week 12, end of treatment and 6 months after the end of treatment with the quantitative VERSANTR HCV 3.0 Assay (bDNA)(Siemens). Samples below the limit of quantification were tested with VERSANTR HCV RNA Qualitative Assay (TMA)(Siemens). SVR was defined as undetectable serum HCV RNA by TMA at end of 6 months post-treatment follow-up. At treatment initiation PPV was defined with a cut-off set up at ≤400 103 IU/ml; at week 4 the PPV was defined as TMA undetectable or >2 log drop baseline viral load. Results. The overall SVR rate was 46% (53% in naïve patients and 38% in non-naïve patients). Conclusions. Undetectable HCV RNA at week 4 (RVR) when assessed with a sensitive assay (TMA) is more accurate (96%-100%) than baseline cut-off (<400 103 IU/ml) to predict SVR both in naïve and in experienced patients. The absence of EVR at week 12 (less than 2 log reduction of HCV RNA) is a strong predictor (96%-100%) of non response to therapy independently of the patients pretreatment status.
305 PREDICTABILITY OF RESPONSE: POSITIVE AND NEGATIVE PREDICTIVE VALUES OF RAPID AND EARLY VIROLOGIC RESPONSES TO PEGINTERFERON ALFA-2B AND RIBAVIRIN IN THE TREATMENT OF CHRONIC HEPATITIS C

Fred Poordad1, Chrispin Kambili2; 1Cedars-Sinai Medical Center, Los Angeles, CA; 2Schering-Plough Corporation, Kenilworth, NJ

Background: Assessing viral kinetics in response to peginterferon (PEG-IFN) alfa and ribavirin (RBV) can help predict treatment response among patients with chronic hepatitis C. Hepatitis C virus (HCV) RNA levels decrease rapidly after initiation of treatment with PEG-IFN alfa-2b/RBV. To determine the value of assessing early viral kinetics during PEG-IFN alfa-2b/RBV, positive and negative predictive values (PPVs; NPVs) of rapid and early virologic response (RVR; EVR) for sustained virologic response (SVR) were culled from PEG-IFN alfa-2b articles or abstracts. Methods: Published PEG-IFN alfa-2b data were evaluated for PPVs and NPVs for RVR and/or EVR. PPVs and NPVs were calculated if not reported but RVR and/or EVR rates and SVR rates were available. RVR was defined as undetectable HCV RNA at wk 4 of treatment (lower limit of detection <50 IU/mL in most studies). EVR was defined as undetectable HCV RNA or a >2 log10 decrease from baseline at wk 12 of treatment. Results: Patients from applicable trials (N=2000) were monoinfected with HCV or coinfected with HCV/HIV and were treated with PEG-IFN alfa-2b (1.0 or 1.5µg/kg/wk or 50-150µg/wk) and various doses of RBV (800-1400mg/d). Treatment duration was 48 or 24 weeks, generally depending on genotype (G). Attaining RVR was highly predictive of attaining SVR in patients with any genotype who were treated for 48 wks (PPV 89%), in G1/4 patients treated for 48 wks (PPV 81%), and in G2/3 patients treated for 24 wks (PPV 85-90%). Not attaining RVR was a less reliable predictor of not attaining SVR for all genotypes (NPV 59%); NPVs were 84% among G1/4 and 44-63% among G2/3 patients. G2/G3 patients were analyzed separately in 1 study; the PPV and NPV for RVR were 89% and 50%, respectively, for G2 patients and 100% and 57%, respectively, for G3 patients. Failure to attain EVR was a consistent indicator of failure to attain SVR (NPV 95-100%), whereas attaining EVR was a less reliable predictor of attaining SVR (PPV 67-72%) for all genotypes. Among African Americans, NPVs and PPVs for EVR were 100% and 48-83%, respectively. Studies in G4 patients revealed NPVs for EVR of 86-100% and PPVs for EVR of 76-100%. Conclusions: Predictability of response to PEG-IFN alfa-2b/RBV applied to mono- and coinfected patients. EVR was a better negative than positive predictor of SVR and can be used to guide treatment cessation in G1/4 patients who do not respond by week 12 of treatment. RVR was an excellent positive but poor negative predictor of SVR. NPVs and PPVs for EVR can be used as a patient motivator and can reliably be used as part of the treatment algorithm for future studies and in clinical practice.

Disclosures: The following people have nothing to disclose: Michelle Martinot-Peignoux, Sarah Maylin, Marie Pierre Ripault, Rami Mocuari, Nathalie Boyer, Nathalie Giuly, Corinne Castelnu, Patrick Marcellin.
BACKGROUND Patients infected with hepatitis C virus genotype 2 (HCV-2) or HCV-3 respond better to interferon alfa (IFN-α) treatment than HCV-1 or HCV-4 patients. The mean initial decline in HCV RNA during IFN-α therapy is faster for HCV-2 and HCV-3 compared to HCV-1 patients. Little is known about viral kinetics in patients with HCV-4. AIMS The aim of our study was to determinate genotype specific differences in viral kinetics in HCV-1 and HCV-4 patients during a modified treatment regimen with a high initial dose of interferon (induction). METHODS We treated naive patients with HCV-1 (n=42) or HCV-4 (n=12) with triple antiviral therapy consisting of amantadine hydrochloride and ribavirin, combined with 6 weeks of IFN-α2b induction (week 1-2: 18 MU/day, week 3-4: 9 MU/day, week 5-6: 6 MU/day), thereafter combined with weekly Peg-IFNα2b, for 24 or 48 weeks. HCV RNA was assessed at baseline, day 1, 2, week 1, 2, 4, 6, 8, and then every 4 weeks until end of treatment by quantitative bDNA (LLD 615 IU/ml), qualitative PCR (LLD 50 IU/ml), and TMA (LLD 5 IU/ml). Viral dynamics were estimated using the bi-phasic model for HCV during treatment with IFN-α. RESULTS Baseline HCV RNA levels, and the 1st and 2nd phase decline in HCV RNA, were similar in HCV-1 and HCV-4 patients (Figure). Mean time to reach a TMA negative status in patients with subsequent SVR was shorter in HCV-4 (4.3 ± 2.3 weeks) compared to HCV-1 (6.4 ± 4.5 weeks), this difference was not significant. SVR was achieved by 43% of HCV-1 and 50% of HCV-4 patients. CONCLUSION Viral kinetics are similar in HCV-1 and HCV-4 patients, these results confirm that HCV-4 patients should be treated as HCV-1.

Background & Aim: The early viral response, defined as undetectable or at least a 2-log decrease in HCV RNA level after 12 weeks of treatment, is very important for predicting which hepatitis C patients are not likely to display a sustained viral response (SVR) to peginterferon (Peg-IFN) plus ribavirin (RBV) combination therapy. In this study, we investigated the relationship between the viral kinetics during the first 8 weeks and the antiviral outcome to identify factors with a high positive predictive value (PPV) or negative predictive value (NPV) for SVR. Patients & Methods: This study was conducted at Osaka University Hospital and institutions of participating in the Osaka Liver Forum. A total of 551 patients with chronic hepatitis C (332 males, 218 females; mean age 55.6 ± 10.2 y.o.) were treated with combination therapy of Peg-IFN alfa-2b at a dose of 1.5 µg/kg/week and RBV each at 600 mg/day (body weight [BW] ≤ 60 kg) or 800 mg/day (60 < BW ≤ 80 kg) or 1000 mg/day (BW > 80 kg) for 48 weeks. All had HCV genotype 1b with over 100 KIU/ml HCV RNA. Serum HCV RNA level was assessed at week 2 and every 4 weeks during therapy and 24 weeks after the therapy by COBAS AMPLICOR HCV test, v2.0 (<50 IU/ml), and COBAS AMPLICOR GT HCV MONITOR test, v2.0 (5 - 5000 IU/ml). Results: At week 2, 33 out of 39 patients who had undetectable (<5 KIU/ml) or at least a 2-log decrease in HCV RNA achieved SVR (PPV = 85%). Ninety-one of 93 patients with less than a 1-log decrease in HCV RNA did not achieve SVR (91/93, NPV = 98%). At week 4, 21 patients had undetectable serum HCV RNA (<50 IU/ml), and achieved SVR (21/21, PPV = 100%). Seventy-five patients had less than a 1-log decrease in HCV RNA, and none achieved SVR (75/75, NPV = 100%). Similarly, at week 8, 73 patients had less than a 2-log decrease in HCV RNA, and none achieved SVR (NPV = 100%). Conclusion: Early viral kinetics in the first 8 weeks can predict PPV and NPV for SVR; especially useful are the 1-log decrease in HCV RNA at week 4 and 2-log decrease at week 8, which are excellent markers for NPV in Peg-IFN and RBV combination therapy.

309 IMPACT OF REDUCING PEGINTERFERON ALFA-2B AND RIBAVIRIN ON EARLY VIRAL RESPONSE IN GENOTYPE 1 INFECTED PATIENTS WITH CHRONIC HEPATITIS C

Background & Aim: Patients with early viral response (EVR), defined as undetectable or less than a 2-log decrease in HCV RNA level after 12 weeks of treatment, show a high probability of SVR in pegylated interferon (Peg-IFN) and Ribavirin (RBV) therapy for chronic hepatitis C patients with genotype 1. We evaluated the effect of Peg-IFN alfa-2b and RBV dose reduction on EVR in patients with genotype 1 and high viral load. Patients & Methods: This study was conducted at Osaka University Hospital and institutions of participating in the Osaka Liver Forum. A total of 839 patients with chronic hepatitis C (476 males, 362 females; mean age 56.3 ± 10.0 y.o.) were treated with combination therapy of Peg-IFN alfa-2b and RBV for 48 weeks. All had HCV genotype 1b with over 100 KIU/ml HCV RNA. We also evaluated based on the amounts of Peg-IFN alfa-2b and RBV given during the first 12 weeks of treatment. The mean doses of both drugs were calculated as the average dose per body weight: Peg-IFN, μg/kg/week; RBV, mg/kg/day. We also calculated the complete EVR (c-EVR) rate, defined as undetectable serum HCV RNA from 13 to 24 weeks, achieved SVR. In patients who received 12 - 14 mg/kg of RBV, the c-EVR rate was 36% (5/14) for those given 0.75 μg/kg (50%) - 1.2 μg/kg (80%) of Peg-IFN, 54% (15/28) for those given 1.2 - 1.5 μg/kg of Peg-IFN, and 61% (42/69) for those given 1.5 - 1.8 μg/kg of Peg-IFN. Similarly, the c-EVR rate was 30% (13/43), 56% (104/186), 53% (34/64) in patients who received 10 - 12 mg/kg of RBV, 42% (11/26), 49% (35/71), 56% (22/39) in those who received 8 - 10 mg/kg of RBV, and 36% (5/14), 50% (9/18), 60% (6/10) in those who received 6 - 8 mg/kg of RBV. No decline in c-EVR rate was observed among patients with more than 1.2 μg/kg of Peg-IFN, but the c-EVR rate declined among those with less than 1.2 μg/kg of Peg-IFN (p < 0.001, Fisher exact test). Conclusion: Peg-IFN reduction up to 80% (≥1.2 μg/kg/week) can maintain approximately 50% of EVR regardless of the RBV dosage.

310 EFFECTS OF SYSTEMATIC NURSE-PROVIDED THERAPEUTIC EDUCATION ON ADHERENCE AND EFFICIENCY OF PEG-INTERFERON-A2A(PEGASYS®)-RIBAVIRIN TREATMENT IN CHRONIC HEPATITIS C (PEGOBS PROTOCOL)

Dominique Larrey, Annie Salsé, Georges-Philippe Pageaux, Nathalie Funakoshi, Didier Ribard, Olivier Bouet, Valérie Hyvart, Byram Nwalongo, Emmanuel Vanche, Jean-Pierre Arpurt 7, André-Jean Rémy, Sohiane Dahmouni, Natalia Kharlova, Jean-Pierre Daurès, 1 Liver Unit/School of Medecine, St Eloi Hospital/INSERMU632, Montpellier, France; 2 Liver Unit, Nimes Hospital, Nimes, France; 3 Liver Unit, Beziers Hospital, Beziers, France; 4 Liver Unit, Ales Hospital, Ales, France; 5 Liver Unit, Narbonne Hospital, Narbonne, France; 6 Liver Unit, Avignon Hospital, Avignon, France; 7 Liver Unit, Perpignan Hospital, Perpignan, France; 8 Clinical Research, Laboratory Roche, Paris, France; 9 Bio-statistics Department, IURC, Montpellier, France

Introduction: Failures of PegIFN-a2a/ribavirin combination in chronic hepatitis C are mainly due to a poor adherence and side effects. TT optimization is currently recommended. However no prospective study has still been performed for assessing the effect of systematised therapeutic education. Aim: to assess the effect of systematic nurse-provided therapeutic education on adherence and efficiency of PegIFN-a2a (Pegasys®)-ribavirin in pts with chronic hepatitis C. Patients and methods: multicentric, prospective study, randomized in 2 groups: GrA: systematic nurse consultation after medical consultation at D0, 4, 8, 12, 24, 36; performed with a standardised questionnaire; GrB: experiment in an experimented center (center 1) and newly formed nurses. A total of 239 randomized pts: GrA 123; GrB 116; center 1: an experimented center (center 1) and newly formed nurses. All had chronic hepatitis C (476 males, 362 females; mean age 56.3 ± 10.0 y.o.) were treated with combination therapy of Peg-IFN alfa-2b and RBV for 48 weeks. All had HCV genotype 1b with over 100 KIU/ml HCV RNA. We also evaluated based on the amounts of Peg-IFN alfa-2b and RBV given during the first 12 weeks of treatment. The mean doses of both drugs were calculated as the average dose per body weight: Peg-IFN, μg/kg/week; RBV, mg/kg/day. We also calculated the complete EVR (c-EVR) rate, defined as undetectable serum HCV RNA from 13 to 24 weeks, achieved SVR. In patients who received 12 - 14 mg/kg of RBV, the c-EVR rate was 36% (5/14) for those given 0.75 μg/kg (50%) - 1.2 μg/kg (80%) of Peg-IFN, 54% (15/28) for those given 1.2 - 1.5 μg/kg of Peg-IFN, and 61% (42/69) for those given 1.5 - 1.8 μg/kg of Peg-IFN. Similarly, the c-EVR rate was 30% (13/43), 56% (104/186), 53% (34/64) in patients who received 10 - 12 mg/kg of RBV, 42% (11/26), 49% (35/71), 56% (22/39) in those who received 8 - 10 mg/kg of RBV, and 36% (5/14), 50% (9/18), 60% (6/10) in those who received 6 - 8 mg/kg of RBV. No decline in c-EVR rate was observed among patients with more than 1.2 μg/kg of Peg-IFN, but the c-EVR rate declined among those with less than 1.2 μg/kg of Peg-IFN (p < 0.001, Fisher exact test). Conclusion: Peg-IFN reduction up to 80% (≥1.2 μg/kg/week) can maintain approximately 50% of EVR regardless of the RBV dosage.
48W : 69.7 vs 53.2%; center 1 : 24W : 94.1 vs 90%; 48W : 79.1 vs 48.8%. HCV RNA disappearance was more frequent (p<0.01) in GrA vs GrB at W12 : 72.8 vs 57.1%; W24 : 75.2 vs 59.8%; EOT : 70.6 vs 52%. For center 1 : W12 : 76.9% vs 55.7%; W24 : 84.1 vs 62.9%; EOT : 80% vs 55%. Sustained virological response (SVR) was significantly higher: 37.7 vs 25% for all pts; naive : 46.4 vs 31%; re-TT : 25 vs 16%; center 1 : overall 48.4 vs 24%; naive : 66.7 vs 37%; re-TT : 32.3 vs 7%. SVR according to genotypes: HCV1, 4, 5 : 30.7 vs 14%; HCV 2, 3 : 50 vs 43%. Center 1 : HCV1, 4, 5 : 41.9 vs 10%; HCV 2, 3 : 61.9 vs 52%. No difference according to the stage of fibrosis. Conclusion: The systematic nurse-provided therapeutic education is significantly associated with a better adherence to the TT and a better virological response. The beneficial effect was more significant in pts treated 48 W and in center with nurse particularity experimented for therapeutic education (center 1). Comments: These results show : 1) the importance of therapeutic education in the TT of hepatitis C particularly in the most difficult groups with relatively resistant genotypes and previous therapeutic failures; 2) the importance of nurse experience in therapeutic education. We thank Roche Laboratory for its support.

311 CYTOKINES-CHEMOKINES NETWORK IS MODULATED BY PEGYLATED INTERFERON MONOTHERAPY IN CHRONIC HEPATITIS C PATIENTS

Manuela G. Neuman1,2, Gadi Katz1, Izabella M. Malkiewicz3, Rustan Esguerra1,2, Kevin Sha1,2, Hepatitis International Therapy Group1; 1University of Toronto, Toronto, ON, Canada; 2In Vitro Drug Safety and Biotechnology, Toronto, ON, Canada

Pegylated-interferon (PEG-IFN) monotherapy is needed in hepatitis C virus (HCV)infected-patients with renal complications and post-transplant recurrent HCV. The aim of the study was to evaluate the cytokine-chemokine network in HCV patients, to correlate serum IL-8, RANTES, tumour necrosis factor alpha (TNFα), and transforming growth factor-beta (TGFβ)levels with the severity of fibrosis, and the responses to the PEG-IFNα-2b at baseline, end-of-therapy and follow-up. METHODS: 180-non-cirrhotic patients were part of a randomized, active-controlled, double-blind-dose-finding clinical trial PegIntron™ (Schering-Plough, Kenilworth, NJ, USA) to study the efficacy of monotherapy at doses of 0.5, 1.0 and 1.5 mg/kg/week for 48 weeks. The patients were grouped by PEG-IFNα-dose received. In each group the data was stratified by responses to therapy: sustained-response-SR (HCV-RNA undetectable 6 months after the end of therapy), relapse-response-RR (HCV-RNA undetectable at the end of therapy) or no-response-NR (detectable HCV-RNA at the end of therapy). Serum cytokines were measured by ELISA. Student-Ttest with Bonferroni correction determined the significance between the groups. The χ2 test or Fisher's exact test compared the frequency of data between groups. RESULTS: There were no statistical differences regarding the demographics, viral load, genotypes, IL8, RANTES, TNFα, and TGFβ grade of inflammation as well as fibrosis scores between groups at baseline. Of 180 patients; 3 had 0 histological-activity-index (HAI), 47 mild, 121 moderate and 9 high; [MHAI 1-50; M HAI-2-84; MHA13-46] and had Metavir-fibrosis [MF0-5; MF1-152; MF2-13; MF3-10]. A good correlation was seen between the HAI and TNF-α levels (r=0.92, p<0.001) in all the patients (r=0.85; p<0.001). IL-8 and RANTES increased significantly at MHAI-3 versus lower MHAI-1-2. TGFβ levels increased significantly with the severity of fibrosis. The kinetics of TNFα during the therapy followed the responses. In SR the levels of TNFα and apoptosis decreased significantly at the end-of-therapy and the follow-up. This is the first study to illustrate that in monotherapy there is a good correlation between the reduction of the HAI and the decrease of TNFα levels and apoptosis. Regardless the dose of therapy, TGFβ levels decrease significantly in all the SR-patients versus their initial values. CONCLUSION: Low baseline serum TNFα is a predictor for sustained response to therapy. PEG-IFN reduces stellate cell activation contributing to reduced fibrosis.

312 VIRAL KINETICS CAN QUICKLY PREDICT SUSTAINED VIROLOGICAL RESPONSE IN HCV PATIENTS WITH NORMAL ALT TREATED WITH PEGYLATED IFN α2B AND RIBAVIRIN: A PROSPECTIVE STUDY

Pierre Deltenre1,2, Valérie Canva1, Alexandre Louvel1,2, Sébastien Dharancy1,3, Laurence Bocket1, Antoine Rollebecque1,2, Jeanne Boitard1,2, Catherine François1, Sandrine Castelian2, Gilles Doverlie1, Jean Henriot2, Philippe Mathurin1,2,1Hepatology, Hôpital Huriez, Lille, France; 2Hepatology, Hôpital de Jolimont, Haineville, France; 3INSERM U795, Lille, France; 4Virology, Hôpital Calmette, Lille, France; 5Virology, CHU, Amiens, France

Treatment is recommended in HCV patients (pts) with normal ALT only for viral eradication. HCV viral kinetics during antiviral therapy comports a two phase decline. The second slow δ phase is related to infected cell loss. δ phase is predictive of sustained virological response (SVR) and may be estimated by reduction of viral load (VL). In pts with normal ALT, a good estimate of the δ phase is required to determine as soon as possible the need to continue treatment. Aim: to determine the earliest and optimal time when decline of logVL may be predicted.

Methods: The prediction of viral kinetics was expressed by the AUROC curves. Viral load were assessed at 1, 4, 8 hours, days 1 to 4, 7, 14, 21, 28 and 2 and 3 months during treatment. Results: 24 pts [17 with genotype 1) were included. On overall patients, the median ALT level was 26±6 IU/L. There was no significant fibrosis. Median baseline VL was 284500 IU/ml (95% CI: 22000-320000). SVR was achieved in 62% (53% for genotype 1 pts). On overall patients, reduction of VL at day 21 was the earliest time estimating SVR (AUROC curve of logVL: 0.848±0.086, p<0.0001) but day 28 has the highest AUROC curve of logVL for estimating SVR (0.981±0.02, p<0.0001). Months 2 and 3 didn't have better AUROC curves of logVL than day 28. In a sensitivity analysis restricted to pts with genotype 1, reduction of VL at day 28 had a better predictive value of SVR than reduction of VL at day 21 (AUROC curves of logVL: 0.962±0.04 vs 0.759±0.13, p=0.02). No SVR was observed in genotype 1 pts with a decline of VL <1 log from baseline to day 28. In terms of optimal cut-off in genotype 1 pts, a decline of VL ≥2 log at day 28 was the best predictor of SVR (sensibility 95%, specificity 76%.
The elimination of infected cells is highly important for response to antiviral treatment in patients with chronic hepatitis C. The mechanisms of the elimination of infected cells are not well understood. Cell death by apoptosis could be highly relevant for the elimination of infected cells. Aim of the present study was to investigate 1. Dynamics of apoptosis during antiviral treatment and the relevance of apoptosis for viral kinetics and infected cell loss in patients with chronic hepatitis C during antiviral therapy and 2. To compare apoptosis dynamics with dynamics of alanine aminotransferase (ALT), aspartate aminotransferase (AST) and gamma glutamyl transpeptidase (GGT).

**Methods.** Apoptotic activity was monitored by quantification of apoptotic cytokeratin-18 neoepitopes in serum from patients with chronic hepatitis C (n=16) before, several times during and after treatment with pegylated interferon alfa-2a and ribavirin. The dynamics of apoptotic activity was compared with ALT, AST and GGT, and the viral kinetic parameter infected cell loss delta. **Results.** During the first week of antiviral treatment only minor changes of apoptotic activity were observed. After 4 weeks of treatment, apoptotic activity declined significantly compared with baseline. Later during treatment, however, apoptotic activity increased again to levels similar to baseline. After treatment, apoptotic activity declined significantly. Overall, GGT levels showed a similar kinetic profile during and after treatment. ALT activity also showed a significant decline at week 4 compared with baseline but, in contrast to apoptotic activity, ALT remained on a reduced level during and after the treatment period. AST showed a slower and weaker decline than the ALT activity. Baseline apoptotic activity was inversely correlated with the infected cell loss while an increase of apoptotic activity within the first 4 treatment weeks compared with baseline was positively correlated with the infected cell loss.

**Conclusion.** Apoptosis appears to be an important form of cell death during interferon alfa based treatment which is associated with infected cell loss and is underestimated by ALT and AST activity.

Hepatitis C Treatment Outcomes in the Rhode Island Department of Corrections

Kara Chew1, Scott A. Allen2,3, Lynn E. Taylor2,3, Josiah D. Rich2,3, Edward Feller4; 1Department of Medicine, University of California, San Francisco, San Francisco, CA; 2Department of Medicine, Warren Alpert Medical School of Brown University, Providence, RI; 3Miriam Hospital, Providence, RI

Introduction: As many as 83% of the USA’s 2 million injection drug users are incarcerated at some time. An estimated 29-43% of hepatitis C virus (HCV)-infected people in the USA are released from prisons or jails yearly. We report our experience with pegylated interferon (PEG-INT) plus ribavirin treatment of 71 HCV RNA-positive male inmates at the Rhode Island Department of Corrections (RIDOC). Methods: We reviewed charts of all male inmates identified as having initiated HCV treatment between October 2000 and April 2004. HCV-infected individuals were identified by HCV antibody screening at intake for known risk factors, elevated aminotransferase levels, or per individual request. Treatment followed standard guidelines with weight-based dosing of both PEG-INT afo-2b and ribavirin. End of treatment response (ETR) was defined as undetectable serum HCV RNA at end of treatment, and sustained virologic response (SVR) as undetectable serum HCV RNA 6 months post-treatment. Endpoints were completion of therapy plus 6 months for SVR, therapy discontinuation, and loss to follow-up. Results: At data collection, 71 patients had reached an endpoint as defined above. The majority was white (80%). The cohort included genotype 1 (65%), genotype 2 (17%), genotype 3 (13%), genotype 4 (5%). Ninety-nine percent had a history of substance use (drug injection, non-injection drug use, or alcohol use). All 13 African-Americans (AA) had genotype 1. Of 59 patients having liver biopsy, 41 (70%) had early stage disease, defined as stage 0-1, 1-2, or 2. Overall ETR was 39% (28 of 71) and SVR, 28% (20 of 71). Response rate was lower for genotype 1 (ETR 33%, SVR 18%) compared to genotype 2 (ETR 64%, SVR 60%) and genotype 3 (ETR 56%, SVR 50%). Of inmates with genotype 1, no statistical difference existed in ETR or SVR by race (33% ETR in AA vs. 34% in whites; 22% SVR in AA vs. 18% in whites). Thirty-three patients completed treatment and 31 stopped for reasons including side effects (26) or initial non-response (5); 7 did not return for follow-up. Conclusion: Our results support the limited data available that acceptable HCV treatment outcomes can be achieved in prisons. Our small study indicates a difference in treatment response by genotype, but no difference by African-American vs. white race for genotype 1. Incarceration may be the only time that this difficult-to-access population intersects with the health care system long enough for evaluation and treatment. The correctional system has unique potential for HCV management and reducing the reservoir of infection, targeting those at high risk of transmission.

The Cerebral Metabolic and Cognitive Effects of Pegylated Interferon (PIFN) and Hepatitis C Viral (HCV) Clearance

Valerie M. Byrnes1, Ann Miller2, Erin Hill2, Cheryl Weinstein2, David Alsop2, Robert E. Lenkinski3, Nezam H. Afdhal1; 1Hepatology, Beth Israel Deaconess Medical Center, Boston, MA; 2Psychology, Beth Israel Deaconess Medical Center, Boston, MA; 3Radiology, Beth Israel Deaconess Medical Center, Boston, MA

Background: Altered cerebral metabolites and cognitive dysfunction are common findings in chronic HCV infection. The neurologic benefit of HCV clearance has not been well described. Aim: To assess the effect of PIFN and HCV clearance on cerebral metabolites, cognition and mood. Methods: Fifteen patients with non-cirrhotic HCV were evaluated by MRS/MR spectroscopy, neuropsychometric testing and Beck’s depression inventory before, during and after treatment with PIFN. Three cerebral metabolites, including choline (Cho), myoinositol (MI) and N-acetyl aspartate (NAA), were measured from 3 different brain regions (basal ganglia, left frontal cortex and left dorsal-lateral prefrontal cortex) and expressed as a ratio to the control metabolite creatine (Cr). Seven HCV positive controls (not taking PIFN) were also assessed at 2 time points, 3 months apart to determine (i) the variability of cerebral metabolites over time and (ii) the ‘practice effect’ of repeat cognitive testing. Results: At 12 weeks, 13/15 patients had undetectable HCV RNA (<600IU/ml). Of these, 8 were persistently negative for HCV RNA, 5 relapsed, and 1 was lost to follow up. PIFN therapy had no effect on cerebral metabolites. Cerebral Cho/Cr and MI/Cr were significantly reduced in the basal ganglia at the time of follow up when compared to baseline in sustained virologic responders (SVR) but not in non-responders/relapsers (NR/R), p=0.03 and p=0.03, respectively. There were no significant differences observed in cerebral metabolites over time in controls. Memory and executive functioning significantly improved on PIFN when compared to baseline in treated patients (p=0.006, p= 0.002) and in controls (p=0.03 and 0.02). This improvement was preserved in SVRs (p=0.02 and p=0.04) but not in NR/R. Attention significantly improved on PIFN in treated subjects (p=0.03). Language and motor skills were unaffected by PIFN or viral clearance. There was a significant increase in depression scores on PIFN (p=0.02) but no change when compared to baseline in SVRs and NR/R. Conclusion: PIFN does not alter cerebral metabolites but improves cognition in HCV patients. HCV clearance decreases metabolic markers of cerebral inflammation and activation and improves cognition in SVRs, likely due to the clearance of HCV from brain tissue. This study demonstrates the cerebral benefit to HCV clearance.

319 HEPATOCELLULAR CARCINOMA IN LONG-TERM SUSTAINED VIROLOGIC RESPONDERS TO ANTIVIRAL TREATMENT FOR CHRONIC HEPATITIS C
Thomas-Matthias Scherzer, K Rajender Reddy, Katharina Stauffer, Harald Hofer, Petra Steindl-Munda, Peter Ferenci, Internal Medicine 3, Medical University of Vienna, Vienna, Austria; Dept. of Gastroenterology, University of Pennsylvania, Philadelphia, PA

BACKGROUND: Antiviral treatment results in a sustained virologic response (SVR) in 50 to 75% of patients with chronic hepatitis C. Long term follow up studies have observed ongoing SVR in the overwhelming majority. Thus chronic hepatitis C is considered “cured” if a SVR is achieved. Consequently, it is expected that in SVRs long term complications of HCV related chronic liver disease including HCC are eliminated or have a decreased incidence. We report on 5 patients (#1-3 from Austria, #4-5 from USA) who developed HCC during follow up after achieving SVR. During follow up and at diagnosis all were HCV-RNA neg. The key clinical details are summarized in Table 1. #1: After a relapse following a six months interferon (IFN) monotherapy he achieved a SVR after one year treatment with IFNα-2b + IVW and ribavirin (RBV) in 1999. Ultrasoundography in
12/05 showed a normal liver, but a tumour in the right adrenal. The biopsy revealed a metastasis from HCC. At resection the macroscopic appearance of the liver was normal. 8 months later a tumour in the right adrenal was resected and was a metastatic HCC. 

#2: After two 48 week courses (relapse after 1. treatment) of pegIFNα2a/RBV she achieved a SVR in 2001.4 years later an elevated AFP level (47ng/ml) was noted; liver sonography was normal, but revealed a 5 cm HCC in segment 5/6 a year later. At segmental resection the liver was firm but macroscopically did not have cirrhosis. HCV-RNA was undetectable in the tumour tissue. 

#3: Following two courses (relapse after 1. treatment) of pegIFNα2a/RBV she achieved a SVR in 2004. In 2007 she complained of upper abdominal discomfort and sonography showed a multifocal HCC. 

#4: After 2 years treatment with 60 000 IU/week PEG-IFN-2b and 800mg/d RBV he achieved an SVR in 2001. A large HCC was detected in 2006. It was unresectable and he was placed on chemotherapy. 

#5: Pretreatment liver biopsy showed stage 0 fibrosis. He achieved SVR following 1 year PEGIFN α2b/RBV in 2003. HCC was diagnosed in 2006. A staging laparoscopy revealed a non-cirrhotic liver, but tiny peritoneal implants in the peritoneum. He was placed on chemotherapy. CONCLUSION: Successful antiviral treatment in HCV patients does not prevent development of HCC even in non-cirrhotic livers. Long-term follow up of patients with SVR is mandatory and should include screening for HCC.

### 320 SYSTEMIC FACTORS ASSOCIATED WITH VIROLOGIC NONRESPONSE TO PEGINTERFERON/RIBAVIRIN TRETREATMENT OF CHRONIC HEPATITIS C

Karen L. Lindsay1, Chihiro Morishima2, Elizabeth C. Wright2, Jules L. Dienstag2, Mitchell L. Shiffman2, Gregory T. Everson2, Anna S. Lok2, Herbert L. Bankovsky3, Timothy R. Morgan1, Marc Ghany1, HALT-C Trial Group For the

Methods:

- High rates of sustained virological response (SVR) in patients >50 years infected with HCV genotype 1 with positive prognostic factors treated with peginterferon alfa-2a (PEGASYS®) and ribavirin (COPEGUS®)
- The prognosis of pts with chronic HCV is influenced by viral factors such as HCV genotype (G) and HCV RNA level as well as pt factors such as age, gender, race, cirrhosis and drug adherence. The demographics of HCV infection are shifting with an increasing number of pts now in their 50's. To assess the impact of age on SVR rates we analyzed the data from two large phase III studies of PEG-IFN alfa-2a (40KD) plus ribavirin (RBV) (Fried et al. NEJM 2002 and Hadziyannis et al. Ann Intern Med 2004). **Methods:** We included pts who had HCV G1 and were randomised to 48 wks of treatment with peginterferon alpha and ribavirin. Very little information is available to explain why virologic suppression does not occur in some patients.

**RESULTS:** We evaluated potential factors associated with the lack of a week-20 virologic response in a cohort of previous nonresponder patients with advanced fibrosis undergoing retreatment with peginterferon alfa-2a and ribavirin. Among 1,145 patients enrolled in the HALT-C Trial, 588 who received more than 80% of prescribed therapy for 20 weeks were analyzed. Medication compliance was assessed at each visit by patient self-report, interviews, and returned peginterferon vial counts. Factors related to null response in univariate analyses were entered into a multivariate logistic regression with backward stepwise selection to assess their relative importance. Analyses were performed with the SAS version 9.1.

**CONCLUSIONS:** On-treatment variables associated with virologic null response to peginterferon with ribavirin suggest the lack of a systemic response to interferon, perhaps related to host genetic or environmental factors. These data have important implications for the design and analysis of retreatment trials and trials to evaluate new specifically targeted antiviral therapy for hepatitis C. Further studies are needed to discern whether interferon resistance, viral resistance, or both are playing a role in treatment-adherent patients who have no virologic response to interferon treatment.

### 321 HIGH RATES OF SUSTAINED VIROLOGICAL RESPONSE (SVR) IN PATIENTS >50 YEARS INFECTED WITH HCV GENOTYPE 1 WITH POSITIVE PROGNOSTIC FACTORS TREATED WITH PEGINTERFERON ALFA-2A (40KD) (PEGASYS®) AND RIBAVIRIN (COPEGUS®)

Rajender Reddy1, Diethelm Messinger2, Matei Popescu2, Stephanos J. Hadziyannis1, Division of Gastroenterology, University of Pennsylvania, Philadelphia, PA; 2IST GmbH, Mannheim, Germany; 3Roche, Basel, Switzerland; 4Henry Dunant Hospital, Athens, Greece

**Background:** The progosis of pts with chronic HCV is influenced by viral factors such as HCV genotype (G) and HCV RNA level as well as pt factors such as age, gender, race, cirrhosis and drug adherence. The demographics of HCV infection are shifting with an increasing number of pts now in their 50's. To assess the impact of age on SVR rates we analyzed the data from two large phase III studies of PEG-IFN alfa-2a (40KD) plus ribavirin (RBV) (Fried et al. NEJM 2002 and Hadziyannis et al. Ann Intern Med 2004). **Methods:** We included pts who had HCV G1 and were randomised to 48 wks of treatment with
PEG-IFN alfa-2a (40KD) 180µg/wk plus RBV 1000/1200mg/d. SVR was defined as undetectable HCV RNA by qualitative PCR after 24 wks of untreated follow-up. Results: Overall, the SVR rate in pts ≤50 years was 52.3% (n=438) and 38.9% in the 131 pts who were >50 (p=0.007). SVR rates in pts aged >50 years were heterogeneous and varied according to previously well-established prognostic factors (Table). In particular, SVR rates were higher in pts without advanced fibrosis, those with low baseline serum HCV RNA levels, those pts who received ≥80% of the planned dose of PEG-IFN and those patients who received ≥60% of the planned dose of RBV. Overall, age did not influence whether pts completed therapy (75.6% of pts ≤50 vs 73.3% of pts >50 years [p=0.5954]). However, there was a trend towards lower cumulative PEG-IFN exposure in older pts (7235µg in pts ≤50 vs 6868µg in pts >50 [p=0.0098]) and a significantly lower cumulative RBV exposure in older pts (304g in pts ≤50 vs 252g in pts >50 [p=0.0001]). Decreasing RBV exposure to <60% of target has been associated with a dramatic reduction in SVR rates (Reddy et al. Clin Gastro Hepatol 2007). In our study more pts >50 years had dose reductions resulting in <60% of target RBV exposure than pts ≤50 years (38% vs 22%). Discontinuation rates due to any AE was similar in those ≤50 (11.4%) compared to those >50 years old (11.5%). Conclusions: SVR rates in certain subgroups (those without advanced fibrosis, low HCV RNA levels) of older pts are comparable to younger pts, especially if high rates of adherence can be maintained. Although dose reductions of RBV are more common in >50 years of age, these pts can be effectively treated.

322
LOW DOSE PEGINTERFERON ALFA-2A AND RIBAVIRIN FOR CHRONIC HEPATITIS C, GENOTYPE 2 & 3: VIRAL KINETICS, EFFICACY AND SAFETY

Yaron Rotman, Brian B. Borg, Alejandro Soza, Rohit Loomba, Apurva A. Modi, Jordan J. Feld, Elenita Rivera, Edward Doo, Theo Heller, Marc Ghany, Avidan U. Neumann, T. Jake Liang, Jay H. Hoofnagle

Introduction: Chronic infection with hepatitis C virus (HCV) genotypes 2 & 3 is highly responsive to the combination therapy with peginterferon and ribavirin. Use of lower doses of peginterferon and ribavirin may reduce side effects without loss of efficacy. Aim: To determine whether a lower dose of peginterferon is better-tolerated and just as effective as the standard dose and to compare the viral kinetics of the two regimens.

Methods: Patients were treated with peginterferon alfa-2a (kindly provided by Roche Laboratories, Nutley, NJ) in a dose of 90 μg/week (low-dose regimen, LD) or 180 μg/week (standard dose, SD) in combination with ribavirin (800 mg/day) for 24 weeks. Patients who failed to become HCV RNA negative by week 12 or who relapsed after treatment were eligible for a 48-week course of standard dose (extended treatment, ET).

Results: 30 patients were treated with the LD and, to date, 18 of a planned 30 patients with the SD regimen. Among those receiving LD, 19 (63%) achieved an SVR compared to 10 of 12 patients (83%) receiving SD who have completed treatment and follow up. The 3 non-responders and 4 of 8 relapsers after LD therapy were retreated with ET, and all but one (86%) achieved an SVR. Viral kinetic analyses showed that the mean reduction in HCV RNA levels at 48 hours (first phase) was -1.1 log with LD vs. -2.5 log with SD (p=0.0011). This difference persisted up to day 14 (-2.6 vs. -3.6, p=0.04) and the mean second phase slope was less with LD (-1.2 log/week) than SD (-2.3 log/week) (p=0.08). Patients receiving SD became HCV RNA negative earlier than those in the low-dose group (log rank, p<0.01), such that by week 12, all patients treated with SD (100%) but only 86% treated with LD were HCV RNA negative. Viral kinetics could not predict relapse, the most common cause for treatment failure. In the 7 LD patients who were retreated with ET, viral kinetic measurements were superior with the standard dose of the ET regimen than the initial low dose. Side effects were measured using a visual analogue scale. Patients on LD peginterferon had significantly less fatigue and felt better overall during therapy than patients receiving SD. Depression scores, however, did not differ. Serious adverse events occurred in 2 patients in both groups (sarcoidosis and acute coronary event with LD; fatal drug overdose, and severe mastoiditis and anemia in SD group). Conclusion: Although better tolerated, a reduced dose of 90 μg/week of peginterferon is significantly less potent and, in combination with 800 mg of ribavirin, provided an unacceptably lower SVR rate in patients with chronic hepatitis C, genotypes 2 and 3.

The following people have nothing to disclose: Yaron Rotman, Brian B. Borg, Alejandro Soza, Rohit Loomba, Apurva A. Modi, Jordan J. Feld, Elenita Rivera, Edward Doo, Theo Heller, Marc Ghany, Avidan U. Neumann, T. Jake Liang, Jay H. Hoofnagle

323
IMPACT OF PEGYLATED INTERFERON α AND RIBAVIRIN THERAPY OF CHRONIC HEPATITIS C ON MAJOR SUBSETS OF PERIPHERAL BLOOD AND INTRAHEPATIC LYMPHOCYTES

Krzysztof Tomaszewicz, Romana Modrzewska; Department of Infectious Diseases, Medical University of Lublin, Lublin, Poland

Objective: The role of cellular immune response in pathogenesis of liver cell injury and course of chronic hepatitis C has been previously confirmed. The aim of this study was to determine the modification of T-lymphocyte major subsets during pegylated interferon α and ribavirin treatment and its correlation with response to the treatment. Methods: The assessment of subsets of intrahepatic lymphocytes (IHL) and peripheral blood lymphocytes (PBL) was done in 62 patients with chronic hepatitis C using flow cytometry and immunohistochemical study. CD8+ specific cells were measured using Dimer-X HLA-A2.1: fusion protein [Becton Dickinson] and PepMix HCV (NS3) system prepared by JPT Peptide Technologie GmbH. PepMix includes 143 peptides deriving from NS3 region [serine protease, NTP-dase and helicase] of HCV. Patients were classified as (1) complete responders (CR) with early viral response (EVR) and sustained viral response (SVR); (2) partial responders (PR)
with EVR, no SVR but ALT normalization, and [3] non-responders (NR) with neither EVR nor SVR and with elevated ALT levels 6 months after the treatment. Results: Significant increase in peripheral blood CD4+ cells, was observed in week 12 of treatment in patients with both complete and partial response to therapy (45,9±5,4% versus 57,3±8,4%, p<0,001 and 42,8±6,6% versus 49,4±7,1%, p<0,01, respectively). There were no significant modifications in nonspecific CD8+ subsets, but after 12 week of treatment in patients with response to therapy, decrease or lack of HCV-specific CD8+ cells were observed (0,26±0,14% versus 0,07±0,04%, p<0,0001). The assessment of subsets of intrahepatic lymphocytes revealed a significantly larger percentage of CD8+ cells in pretreatment liver biopsies from patients with sustained viral response (36,6±5,5% in CR versus 29,8±7,1% in PR, p=0,001 and 26,9±6,3% in NR, p<0,001). Conclusions: The results confirmed the impact of interferon α and ribavirin treatment on cellular response. Some immunological host factors should be considered in the early prognosis of successful treatment. Decrease of HCV-specific CD8+ cells during PEG-Interferon treatment may predict complete response to therapy. Increase in nonspecific CD4+ PBL has been documented both in complete and partial responders and may support continuation therapy and better prognosis.

324
PREVALENCE OF BIPOLAR AFFECTIVE DISORDER IN PATIENTS WITH A POSITIVE DEPRESSION SCREEN AT THE INITIATION OF INTERFERON THERAPY FOR CHRONIC HEPATITIS C
Jeffrey S. Olson1, Atif Zaman1, Kenneth D. Ingram1, James R. Phelps2; 1Gastroenterology, OHSU, Portland, OR; 2PsychEducation.org, Corvallis, OR

Purpose: Interferon therapy is associated with worsening of underlying depression, and clinicians frequently screen for depression before starting interferon. Bipolar affective disorder (BAD) patients often present with symptoms of depression rather than mania, and as a result these patients can be misdiagnosed with unipolar depression if a positive depression screen is not followed up with an appropriate screen for subtle or inactive manic traits. Our aim was to assess the prevalence of BAD in hepatitis C patients with a positive depression screen, and to determine if BAD is associated with an increased rate of psychiatric complications during interferon therapy. Methods: Retrospective study performed at the OHSU Hepatology Clinic from 12/04 to 9/06. All adult patients initiating interferon therapy (n=112) were given the Physicians Health Questionnaire (PHQ-9); a validated, self-administered survey of depressive symptoms used as a sensitive screening tool for unipolar depression. Patients with a positive PHQ screen were asked to complete the Mood Disorders Questionnaire; a validated, sensitive and specific screening tool for bipolar disorder. Chart review was performed on all 112 patients for the six month period following initiation of interferon. Psychiatric complications (change in psychiatric medications, referral to psychiatry, visits to the ER, hospital admissions, and discontinuation of interferon therapy) were recorded. Results: Three groups were formed: Group A: 89 patients had a negative PHQ depression screen; and adverse psychiatric events occurred in 22 patients (24.7%). Group B: 16 patients had a + PHQ depression screen, but a negative MDQ screen for manic traits; and adverse events occurred in 3 patients (18.8%). Group C: 7 patients had a + PHQ depression screen, and a + MDQ screen for manic traits; and adverse events occurred in 5 patients (71.4%). Chi Square comparison of groups showed a statistically significant increase in adverse events in group C compared with group A (p=0.045). The increased rate of complications in group C compared with group B approached statistical significance (p=0.169). Conclusions: This is the first study of its kind to evaluate the rate of BAD in interferon patients with a positive depression screen. BAD was defined by a + MDQ screen was common (7/23 patients), and was also associated with a markedly higher rate of psychiatric complications during interferon treatment when compared to both patients without depression, and to patients with depression without manic traits. This preliminary study highlights the importance of follow up screening for BAD in patients with a positive depression screen.

325
PATIENT EDUCATION IMPROVES ADHERENCE TO PEGINTERFERON α-2B AND RIBAVIRIN IN CHRONIC GENOTYPE 2 OR 3 HEPATITIS C VIRUS INFECTION: A PROSPECTIVE, REAL-LIFE STUDY (CHEOBS STUDY)
Patrice Cacoub1, Denis Ouzan2, Thierry Fontanges3, Jean-Philippe Lang4, Pascal Melin5, Michel Rothöf6, Marina Varaster2, Patrick Marcellin7, Michel Chousterman7; 1Hôpital Pitié Salpêtrière, Paris, France; 2Institut Arnaud Tzanck, Saint Laurent du Var, France; 3Centre de l’Appareil Digestif, Bourgoin Jallieu, France; 4Centre Hospitalier Erstein, Erstein, France; 5Hôpital Général, Saint Dizier, France; 6INSERM, Bagneux, France; 7ClinSearch, Bagneux, France; 8Hôpital Beaujon, Clichy, France; 9Hôpital de Créteil, Créteil, France

Objective: The CHEOBS study is a French multicenter, prospective, observational study designed to analyse the factors related to compliance with the combination treatment with peginterferon α-2b (peg-IFN) and ribavirin (RBV) in patients with chronic hepatitis C virus (HCV) infection. Main results in patients with a genotype 2 or 3 infection are presented. Patients and Methods: From January 2003 to December 2004, 705 out of 2001 patients included were infected with a genotype 2 or 3 virus among which 674 patients had sufficient data to be analyzed: 370 patients [group 1] received an educational program to optimize the tolerance and the efficacy of HCV treatment whereas 304 pts [group 2] had no specific formation. Baseline characteristics, impact of the educational program on compliance and sustained virological response (SVR = 6 months after stopping therapy) were assessed. Results: The mean age was 45 ± 11 years, 59% were male, 17% were unemployed and 6% had poor socio-economic conditions. Patients were excesive alcohol consumers (170, 25%), smokers (354, 53%), drug abusers (current [28, 4%], past [332, 50%]), past depressive alcohol consumers (170, 25%), smokers (354, 53%), drug abusers (current [28, 4%], past [332, 50%]), had past depression (180, 27%) and/or current psychiatric disorders (158, 24%). HCV viral load was >800,000 IU for 173 patients (38%) and genotype was 2 [202, 30%] or 3 (472, 70%). A high stage of fibrosis was frequent: Metavir F2-F3 (211, 42%), cirrhosis (69, 14%). Co-morbidities included HIV co-infection (26, 4%), HBV co-infection (9, 1%), or other chronic diseases (153, 23%). There was no significant difference on all these parameters between the groups, except that patients of group 1 had more frequently a past depression (31% vs 22%, p = 0.014), current psychiatric disorders (27% vs 20%, p = 0.044) and a current drug use (6% vs 2%, p = 0.01). At month 6, adherence to bitherapy was 61% in educated and 48% in non-educated patients (p=0.01). Adherence to pegIFN was 78% and 69% (p=0.06); adherence to RBV was 76% and 56% (p=0.006), respectively. The overall SVR was 72% (308/511).
The rate of SVR tended to be higher (75% vs. 68%) and the rate of relapse lower (11% vs. 16%) in educated patients. Education was associated with improved adherence (odds ratio 1.58, p=0.04) but not with SVR (odds ratio 1.43, p=0.12). Conclusions: In clinical practice, patients with a genotype 2 or 3 HCV chronic infection have a difficult-to-treat profile as they frequently experience past or ongoing mental disorders, drug abuse or cirrhosis. In such patients, a high rate of SVR (72%) can be obtained with a combination of peg-IFN plus RBV. The therapeutic education helped maintain adherence to HCV therapy. The beneficial impact on virological response was not significant.

Disclosures: The following people have nothing to disclose: Patrice Cacoub, Denis Ouzan, Thierry Fontanges, Jean-Philippe Lang, Pascal Melin, Michel Rotily, Marina Varastet, Patrick Marcellin, Michel Chaoumtarian

326 PEGINFERON ALFA-2B AND RIBAVIRIN TREATMENT OF PATIENTS WITH CHRONIC HEPATITIS C AND NORMAL VERSUS ELEVATED AMINOTRANSFERASE LEVELS – FINAL RESULTS OF A PROSPECTIVE OPEN TRIAL

Wolfgang Vogel1, Harald Brunner2, Andreas Maierson3, Ivo Graziaidei1, Martha Rosenbeiger2, Rudolf E. Stauber2, Daniela Wolkersdorfer1, 1Medical University Innsbruck, Innsbruck, Austria; 2KH Kitzing, Vienna, Austria; 3KH Elisabethinen, Linz, Austria; 4KH Leoben, Leoben, Austria; 5Graz Medical University, Graz, Austria

Prognosis of chronic hepatitis C (CHC) seems to be similar in patients with persistently normal transaminases (PNALT) and in those with elevated ALT (EALT). In addition, the response to therapy with interferon and ribavirin is similar in both groups of patients. However, further studies are needed. In this prospective, multi-center, open-labeled clinical trial 231 treatment-naive patients with biopsy-proven CHC with normal or elevated ALT levels received PegIntron 1.5 µg/kg/wk & Rebetol 0.8-1.2g/d for 48 weeks (genotype 1/4) or 24 weeks (genotype 2/3). Study design: Patients were stratified according to elevated or normal (median of 3 measurements over >3 months) ALT, high or low viral titer (cut-off 800,000 IU/ml, bDNA HCV RNA 3.0 assay; Bayer Diagnostics) and genotypes (GT) 1/4 or 2/3. From these 231 patients 47.6% had PNALT and 52.4% had EALT. 76.6% with GT 1 or 4 (77.3% of the PNALT and 76% in the EALT group) and 23.4% patients with GT 2 or 3 (22.7% of the PNALT and 23.9% in the EALT group) were enrolled. The median ALT in the PNALT group was 28 U/ml (GT 1 or 4) and 24 U/ml (GT 2 or 3) and 78 U/ml (GT 1 or 4) and 131 U/ml (GT2 or 3) in the EALT group. Results: The pretreatment characteristics were comparable between the two groups. 65.5% of patients with PNALT had a viral load lower or equal 800,000 IU/ml vs. 66.4% of patients with EALT. Results of liver biopsies at baseline were available from 147 patients. 60.5% of these patients had fibrosis grade 0 or I (70.8% PNALT, 50.6% EALT). There was a difference in the fibrosis grade between the two groups (p=0.0188). From 119/231 patients viral load was determined after week 4: 45.4% had undetectable RNA (46.9% PNALT and 43.6% EALT); after week 12 177/231 pts. were evaluated: 74.6% had undetectable RNA (80.7% PNALT and 69% EALT). 70.6% had undetectable RNA at end of treatment (73.6% normal ALT and 67.8% EALT; 65.5% GT 1/4 and 87% GT 2/3). 6 months after end of treatment (SVR) 49.4% had undetectable RNA (50.9% normal ALT and 47.9% EALT; 65.5% GT 1/4 and 87% GT 2/3). SVRs were significantly worse in the PNALT and EALT group in patients with high viral load (PNALT vs. EALT: 34.5% vs. 33% and 65.5% vs. 67%) but not between groups. Conclusions: Sustained virological response rates after treatment with PegIntron 1.5 µg/kg/wk & Rebetol 0.8-1.2g/d in patients with CHC is independent of elevation of transaminases and are the same in groups stratified for genotype and viral load. In this study patients with EALT had higher levels of fibrosis.

327 COMPARISON OF EFFICACY OF TREATMENT WITH PEGINFERON ALFA-2A PLUS RIBAVIRIN VS PEGINFERON ALFA-2B PLUS RIBAVIRIN AMONG PATIENTS CHRONICALLY INFECTED WITH NON 2/3 HCV GENOTYPES WITH LOW AND HIGH PRETREATMENT VIRAL LOAD

Hanna Berak1, Anna Kolakowska-Rzadzka1, Marek Wasilewski1, Janusz Stanczak2, Katarzyna Szamatulska3, Krzysztof Bardadin3, Andrzej Horban1, 1Hospital for Infectious Diseases, Warsaw, Poland; 2Institute of Mother and Child, Warsaw, Poland; 3Medical Centre for Postgraduate Education, Warsaw, Poland

PATIENTS: 212 patients chronically infected with non 2/3 HCV genotypes were treated 48 weeks with peginterferon alfa-2a (Pegasys, group A) and peginterferon alfa-2b (Peginteron, group B), both plus standard doses of ribavirin. A and B pts were divided into groups with low (<600,000 IU/ml) and high (>600,000 IU/ml) pretreatment viral load (VL) to compare the efficacy of treatment. 17 pts were lost to observation (9 in group A and 8 in group B). The analysis concerned 195 (92%) pts: 92 (91.1%) treated with Pegasys and 103 (92.8%) treated with Peginteron. METHODS: Liver biopsies were analyzed according to the Knodell’s and Scheuer’s scores. The main study outcome was undetectable HCV RNA on week 72 (SVR), 24 weeks after end of treatment. HCV RNA was performed, determined with HCV RNA ASSAY and viral load (VL) with CA HCV MONITOR TEST (both of ROCHE DIAGN SYS.). Statistical analysis was performed with Chi-squared. RESULTS: No statistically significant difference was found on the positive SVR in group A vs B and low pretreatment VL: 20 (66.7%) pts in group A and 17 (58.6%) in group B (p=0.523). Ten (33.3%) pts in group A and 12 (41.4%) in group B had detectable HCV RNA. Thirty (48.4%) pts with high pretreatment VL in group A and 32 (43.2%) in group B had positive SVR (p=0.549), and 32 (51.6%) in group A and 42 (56.8%) in group B had detectable HCV RNA. There were higher proportions of patients with SVR treated with peginterferon alfa-2a (Pegasys). The low pretreatment VL is a good predictor of SVR.

PEG INFERENCE ALFA-2A MONOTHERAPY IN DIALYSIS PATIENTS INFECTED WITH HEPATITIS C VIRUS

Reinhart Zachoval1, Peter Buggisch2, Petra Reinke3, Rainer Waitas4, Ann Michelsen5, Michael Fuchs6, Wulf Böcher7, Ewert Schulte-Frohlinde8, Jens Encke9, Birgit Kallinowski9. 1Department of Internal Medicine, Ludwig-Maximilians-University, Munich, Germany; 2Department of Internal Medicine, University of Hamburg, Hamburg-Eppendorf, Germany; 3Department of Nephrology, University of Mainz, Mainz, Germany; 4Department of Internal Medicine, Technical University of Munich, Munich, Germany; 5Department of Internal Medicine, University of Heidelberg, Heidelberg, Germany

AIM: Hepatitis C is an important cause of liver related morbidity and mortality under hemodialysis. Data about the efficacy of antiviral treatment with pegylated interferons (PEG-IFNs) are limited in this difficult to treat patient group. Theoretically Peg-IFN alfa-2a should be preferable to Peg-IFN alfa-2b due to the fact that <10% is eliminated by the kidneys. We conducted a multicenter controlled trial to assess the efficacy and tolerability of Peg-IFN alfa-2a monotherapy 135 µg s.c. qw for 48 weeks in treatment naive patients with hepatitis C virus(HCV) infection under hemodialysis. PATIENTS & METHODS: Thirty-eight patients were included: 23 males(61%), mean age 48 years(25-68), mean HCV-RNA 872.749 IU/ml(1523-5.560.000), 29 patients(83%) genotype 1, 3 patients(8%) fibrosis stage 3/4. Patients received 135µg Peg-IFN alfa-2a s.c. qw after dialysis for 48 weeks. Treatment was discontinued at week 24 in those patients without HCV-RNA decline ≥2 log. The primary end-point was sustained viral response(SVR) defined as undetectable HCV-RNA(<50 IU/ml) after 24 weeks of follow-up. In a subgroup the pharmacokinetics of 2 different doses of Peg-IFN alfa-2a (135µg N=5, 180µg N=6) during the first 12 weeks of treatment were assessed by weekly serum measurements (ELISA). RESULTS:Thirty-seven percent (14/38) of the patients had a sustained viral response, 17/38(45%) of the first 12 weeks of treatment were assessed by weekly serum measurements. Dose reduction of Peg-IFN alfa-2a was necessary in 4 patients due to hematologic abnormalities; in 10 patients treatment was discontinued (SAEs N=8, patients' decision N=2). Twelve SAEs were noted during the study including fatal myocardial infarction, coronary bypass operation, retinal infarction, seizures, pneumonia, decomplementation of cirrhosis (1 patient each). In the pharmacokinetic substudy tolerability was comparable in both dosage groups. The observed side effects in this patient cohort were comparable to those observed in patients with normal renal function. Stable concentrations of Peg-IFN alfa-2a were reached within 4-7 weeks in both groups (13 ng/ml with 135µg and 24 ng/ml with 180µg respectively). CONCLUSION: Peg-IFN alfa-2a monotherapy (135µg qw) has a good efficacy in hemodialysis patients (SVR 37%). The 180µg weekly dose which might be even more efficient should be evaluated in a larger trial; repeated injections of Peg-IFN alfa-2a lead to safe and constant drug concentrations in the serum of patients with end stage renal disease. The high rate of SAEs even with Peg-IFN-monotherapy in this group of patients with considerable comorbidity warrants meticulous patient selection and calculation of the potential risk versus the benefit.

PEGINTERFERON ALPHA-2B VS PEGINTERFERON ALPHA-2A IN THE TREATMENT OF CHRONIC HEPATITIS C INFECTION

Ihab Hammoud, Mary Ann H. Sherbondy, Dilip Moonda, Stuart C. Gordon, Rodolfo Guevara, Kimberly Brown; gastro, Henry Ford Hospital, Detroit, MI

BACKGROUND: Pegylated interferon alfa 2a with ribavirin and pegylated interferon alfa 2b with ribavirin are both approved therapies for the treatment of hepatitis C. Although there is no head to head comparison, the efficacy of the two regimens is reported to be similar. OBJECTIVE: We attempted to compare the efficacy of peginterferon alpha-2b and peginterferon alfa-2a based regimens with weight-based dose ribavirin in the treatment of patients with HCV. METHODS: Naive patients with HCV treated with pegylated interferon and ribavirin from 2001 to 2005 at our center were included. Patients received peg 2a or peg 2b and weight-based dose ribavirin for 48 weeks (genotype 1) or 24-48 weeks (genotype 2/3). PCR was checked 24 weeks following therapy to determine SVR. Patients coinfected with HIV, HBV or on dialysis were excluded from analysis. Comparison of baseline characteristics and sustained viral response (SVR) between the two groups were performed. RESULTS: 259 patients were included in the analysis. 212 received peginterferon alfa-2a and ribavirin (Group A) and 47 received peginterferon alfa-2a with ribavirin (Group B). Baseline characteristics of the two groups were comparable as shown in table 1. Dose reductions for either peginterferon or ribavirin were similar for the two groups, 8% for group A and 2% for group B (p=NS). Overall SVR was 38% and 40% in groups A and B (p=NS). For genotype 1 patients, SVR was 23% vs 26% in groups A and B (p=NS). In genotype 1 patients with high viral load, SVR was 20% and 30% in groups A and B (p=NS). In genotype 1 patient weighing greater than 105 KG, SVR rates were 20.7% and 20% for groups A and B (p=NS). CONCLUSION: In a relatively difficult to treat population we found no difference in the sustained response rates between patients treated with peginterferon alfa 2a vs peginterferon alfa-2b and weight based dosed ribavirin.

GM-CSF MAY MODULATE THE RESPONSE TO THERAPEUTIC IFN-α IN CHRONIC HEPATITIS C VIRUS (HCV) INFECTION

Tariq Tajuddin2, Elizabeth Ryan1, John Hegarty2, Cliona O’Farrell1,3; 1Education and Research Centre, St Vincents University Hospital, Dublin, Ireland; 2Liver Unit, St Vincent’s University Hospital, Dublin, Ireland; 3Conway Institute Biomedical and Molecular Sciences, University College Dublin, Dublin, Ireland

Haematological growth factors, particularly GM-CSF and G-CSF, are frequently used to treat anaemia in HCV-infected patients receiving therapeutic interferon alpha. However, targeted use of these factors may also have important immunoregulatory roles in patients who fail to respond to conventional therapy. Previous studies have shown that these non-responsive patients can be identified, prior to treatment, by high levels of the chemokine, CXCL10. It has also been shown that GM-CSF can inhibit CXCL10 expression. In preliminary studies, we found that PBMCs from non-responsive HCV patients secreted low levels of the haematological growth factor GM-CSF compared with patients who responded to interferon alpha. The aim of this study was to determine the relationship between GM-CSF, CXCL10 and HCV infection in chronically infected patients with a view to developing a rationale for targeted therapeutic use of GM-CSF. Circulating GM-CSF was measured in twenty-six women who had been exposed to HCV-contaminated anti-D immunoglobulin and thirteen healthy controls by ELISA. HCV infected patients had detectable levels of circulating GM-CSF (controls: 0 pg/ml vs. 20.7, PCR+ 25 pg/ml ± 18.7); the PCR+ group had significantly more circulating GM-CSF than the healthy controls (p= 0.04), although there was significant inter-individual variation in levels. Peripheral blood mononuclear cells (PBMCs) stimulated with toll-like receptor (TLR-3 and TLR-7) agonists secreted significant quantities of GM-CSF indicating that the raised levels of circulating growth factor in HCV-infected patients were virally induced. GM-CSF suppressed interferon alpha-mediated induction of the chemokine CXCL10 by PBMCs. These data suggest that targeted use of therapeutic GM-CSF may overcome CXCL10-mediated inhibition of interferon alpha responsiveness in chronic HCV infection.

HEPATITIS C ASSOCIATED SYSTEMIC CRYOGLOBULINEMIA: SUCCESSFUL TREATMENT WITH PLASMA EXCHANGE

Jan C. Hofmann1, Robert G. Gish2; 1Department of Medicine, Division of Immunotherapy, California Pacific Medical Center, San Francisco, CA; 2Department of Medicine, Division of Hepatology and Complex GI, California Pacific Medical Center, San Francisco, CA

Introduction: Acute treatment of mixed cryoglobulinemia associated with hepatitis C is indicated for systemic disease characterized by renal dysfunction, cutaneous vasculitis, or peripheral neuropathy. Methods: We reviewed the medical records of 21 patients (pts) who were diagnosed with moderate to severe hepatitis C associated cryoglobulinemia from January, 2005 to May, 2007 and referred for plasmapheresis treatment. The mean age of pts was 54 years (46-64 years old); 11 pts (52%) were male. 18 pts (86%) had HCV genotype 1A or 1B. The median HCV RNA was 733,900 IU/ml (73,620-9,370,000 IU/ml). All pts had positive cryoglobulin studies; median cryocrit was 1.7% (0.3-5.0%). 18 pts (86%) had significant elevation of rheumatoid factor (RF). 79-90% of pts had low complement levels. Clinical Presentation: 17 pts (81%) presented with renal disease. 11 pts (52%) had chronic renal insufficiency and 6 pts (29%) presented with acute renal failure requiring hemodialysis (HD). Of 17 pts with renal disease, thirteen (76%) had a renal biopsy; 12 pts (92%) had MPGN. 17 pts (81%) had elevated 24-hour urine protein; 13 of these pts (76%) had nephrotic range proteinuria. 13 pts (62%) presented with active vasculitic skin lesions. 7 pts (33%) had peripheral neuropathy. Treatment: 19 pts (90%) received a course of inpatient plasma exchange (PE) every other day; mean number of PE treatments (txs) was 8.4 (5-12 txs). 2 pts (9.5%) received outpatient PE. After completion of inpatient PE txs, 8 pts (38%) received low dose cyclophosphamide to prevent rebound of immune complex production. 5 pts (24%) underwent weekly rituximab (4-6 doses). 15 pts (71%) started weekly pegylated alpha interferon after completion of PE txs; 12 pts (57%) started daily ribavirin. Results: 20 pts (95%) experienced clinical improvement. Of 13 pts with nephrotic range proteinuria, 9 pts (69%) had significant decline in urinary protein. 3 of 6 pts (50%) on HD were able to stop dialysis. 17 pts (94%) had a marked decrease in RF with twelve pts (67%) normalizing their RF levels. 12 pts (92%) demonstrated significant improvement in vasculitic skin lesions. 6 pts (86%) experienced slight improvement in symptoms of peripheral neuropathy. 3 pts (14%) with refractory disease required several inpatient courses of PE. 6 pts (29%) received weekly maintenance PE txs. Conclusion: Plasma exchange is an effective therapy for hepatitis C associated cryoglobulinemia, especially in acute treatment of progressive renal disease and cutaneous vasculitis. Some patients may require maintenance plasmapheresis treatment. Successful long-term response to antiviral therapy is essential in controlling this disease.

COMPARISON BETWEEN THE TWO PEGINTERFERONS ALFA IN THE TREATMENT OF CHRONIC HEPATITIS C

Pham T. Thuy, Ho Tan Dat; Hepatology, Medi cal Medical Center, Ho Chi Minh, Viet Nam

In order to have the evaluation of efficacy, safety and to detect the predictors for sustained viral response of two Peginterferons, we have implemented a matched pair study on treatment naive chronic hepatitis C patients treated with weight -based Peginterferon alfa-2b or fixed dose Peginterferon alfa-2a plus Ribavirin. There are 238 naive chronic hepatitis C patients aged from 18 to 68, divided into two equal groups in clinical manifestations. Group I (N=131; 77 genotype 1, 15 genotype 2, 39 genotype 6) were treated with Peg-IFN alfa-2b, 1.5mcg/kg qweek plus Ribavirin 15mg/kg/day; Group II (N=107; 64 genotype 1, 11 genotype 2, 32 genotype 6) were treated with peg-IFN alfa-2a 180mcg/week plus Ribavirin 15mg/kg/day. The time of treatment was 48 weeks. Sustained viral response was undetectable HCV RNA after 24 weeks of follow-up. The treatment outcome can be predicted by analyzing various data on age, sex, weight, serum ALT, genotype and virus load. The sustained viral response rate of Group I was not
different from of GroupB on total patients (62.59% vs. 60.74%, p>0.05). The relapse in two groups were also similar (18.81% vs. 19.75%, p>0.05). The sustained viral response with treatment of Peg-IFN alfa-2b was better than with Peg-IFN alfa-2a in group of high-weighted patients (28.57% vs. 61.9%, p<0.01). Baseline ALT, age, sex, genotye, virus load were not statistically significant predictors of sustained viral response between two Peginterferons. In conclusion, the sustained viral response rate is similar in naive chronic hepatitis C patients treated with Peg-IFN alfa-2a or Peg-IFN alfa-2b. Peg-IFN alfa-2b seems to be better in high-weighted patients. The relapse in two groups are also similar. Side effect of thrombocytopenia more frequently occurs in treatment with Peg-IFN alfa-2a, however it should be further studied in future.

333 IMPAIRED SENSITIVITY IN NON-RESPONDERS TO PEGYLATED INTERFERON PLUS RIBAVIRIN THERAPY ASSESSED BY 2'-5'OLIGOADENYLATE SYNTHETASE ACTIVITY

Michiko Shindo1, Kazushige Hamada2, Teruhsia Morikawa1, Yuichi Harano1, Tomoki Nakajima1, Tadao Okuno1; 1Akashi Municipal Hospital, Akashi, Japan; 2Kyoto Institute for Technology, Kyoto, Japan

[Aim] Approximately half of patients who were treated with pegylated interferon plus ribavirin remain HCV RNA positive. In order to understand host response to exogenous interferon was a determining factor in the outcome of therapy, we assessed 2'-5' oligoadenylate synthetase activity (2-5AS) which is induced by interferon and is an accurate indicator of antiviral effect of interferon. To prevent dose reduction (IFN) dosage by adverse effects leads to unfavorable results in the treatment of chronic hepatitis C. To prevent dose reduction by alleviating adverse effects is important to increase sustained virological response (SVR), Granulocyte colony-stimulating factor (G-CSF) is often used to increase neutrophils, but is costly. We conducted a trial to evaluate whether 8-week oral administration of meloxicam, a COX-II specific non-steroidal anti-inflammatory drug, prevents dose reduction of pegylated interferon alfa-2a in the treatment of chronic hepatitis C.

Tatehiro Kagawa1, Hirokazu Shiozawa2, Sei-ichiro Kojima1, Shinji Takashimizu1, Naruhiko Nagata1, Makoto Numata1, Fumio Morino1, Yasuhiko Nishizaki2, Norihito Watanabe1, Shohei Matuzaki2, Tetsuya Mine1; 1Gastroenterology, Tokai University, Isehara, Japan; 2Digestive Disease and Hepatology Center, Tokai University Tokyo Hospital, Tokyo, Japan

Background & Aim: Reduction or discontinuation of interferon (IFN) dosage by adverse effects leads to unfavorable results in the treatment of chronic hepatitis C. To prevent dose reduction by alleviating adverse effects is important to increase sustained virological response (SVR). To conduct a trial to evaluate whether 8-week oral administration of meloxicam, a COX-II specific non-steroidal anti-inflammatory drug, would decrease the rate of patients requiring dose reduction of pegylated (PEG) IFN in the treatment of chronic hepatitis C. Patients & Methods: The enrollment criteria was (1) presence of serum HCV-RNA, (2) neutrophil count ≥ 1,500 /µl, (3) platelet count ≥ 90,000 /µl, and (4) serum hemoglobin ≥ 10 g/dl. Sixty patients given weekly subcutaneous administration of PEG-IFN alfa-2a (180 µg) for 48 weeks were allocated into the meloxicam group (n = 22) and the control group (n = 38) before treatment. Meloxicam was given orally at a dose of 10 mg once a day for 8 weeks since IFN treatment started. Patients were not allowed to receive G-CSF. Dose of PEG-IFN was reduced to 90 µg when neutrophil and platelet counts fell down below 750 /µl and 50,000 /µl, respectively. Results: Age, pretreatment neutrophil and platelet counts, and body weight were not significantly different between groups. Any adverse effects of meloxicam were not observed. Cumulative rate of patients who required dose reduction was significantly lower in the meloxicam group [Kaplan-Meier plot, P < 0.05]. In the meloxicam group, 9.1% and 40% of patients required dose reduction until week 8 and throughout the treatment, respectively. On the other hand, 44.7% and...
71.9% of the control group required dose reduction until week 8 and throughout the treatment, respectively. Major cause of dose modification was neutropenia. Meloxicam relieved a decline of neutrophils within first 8 weeks from 54.2% to 44.2% (P < 0.05). The COX proportional hazards regression model revealed that lower pretreatment neutrophil count (adjusted HR: 3.0 per 1,000 /μl-decrease, 95% C.I.: 1.5-6.1, P = 0.002) and not receiving meloxicam (adjusted HR: 3.6, 95% C.I.: 1.4-8.9, P = 0.007) were significantly associated with dose reduction. SVR was obtained in 42.9% of the control group and 68.2% of the meloxicam group, however, multivariate logistic analysis revealed that viral serotype and viral load were only independent factors associated with SVR. Conclusions: Eight-week administration of meloxicam prevented dose reduction of Peg-IFN by relieving a decline of neutrophil count in the treatment of chronic hepatitis C.

The following people have nothing to disclose: Tatehiro Kagawa, Hirokazu Shiozawa, Seiichiro Kojima, Shinji Takashimizu, Naruho Nagata, Makoto Numata, Fumitsugu Morino, Yasuhiro Nishizaki, Norihiko Watanabe, Shohei Matsuzaki, Tetsuya Mine

335 GENE EXPRESSION BIOMARKERS PREDICTING RESPONSE TO Pegylated Interferon Alpha (Peg-IFN) and Ribavirin (RBV) IN THE PERIPHERAL BLOOD OF PATIENTS WITH CHRONIC HEPATITIS C (CH-C), Non-Responder (NR) TO PREVIOUS TREATMENT

Zobair M. Younossi1, Rochelle Collantes1, Ancha Baranova1, Amy Kim1, Ganiraju Manyam1, Maria Stepanova1, Chris Santini2, Chris Sigua2, Joanne Chan2, Ayuko Iverson2, Sheng-Yung Chang2; 1Center for Liver Diseases, Inova Health System - Inova Fairfax Hospital, Annandale, VA; 2Celera Diagnostics, Alameda, CA

Re-treatment of previously NR with another course of Peg-IFN and RBV is associated with low sustained virologic response (SVR). AIM: To develop a biomarker profile predicting sustained virologic response (SVR) after antiviral therapy. METHODS: Thirty nine CH-C patients who had previously failed combination therapy were enrolled. Patients were being started on Peg-IFN+RBV (standard doses of PEIFN alpha 2a or 2b and RBV). Blood samples were collected into PAXgene™ RNA blood tubes (PreAnalytix) prior to treatment, 1 day, 1 week, 4 weeks, and 8 weeks after the first dosing. Total RNA was extracted and quantified using RiboGreen™ Quantitation Kit ( Molecular Probes) and was used in PCR. One-step RT-PCR was used to profile 317 mRNAs [160 genes consisting of interferon-inducible, interferon pathway, immune response, and housekeeping genes]. The expression levels of mRNAs of interest were normalized with 6 "housekeeping" genes and a Human Universal Reference RNA (Stratagene). Multiple regression analysis and stepwise selection were performed to assess differences in gene expression at different time points and predictive performance was evaluated for each model. RESULTS: Demographic data of patients included age: 49 ± 6 years, 59% Male, 69% Caucasian, 78% HCV genotype 1, 16% G3 and 6% G4. In all patients prior to treatment, IFI2 expression level predicted SVR (Model p-value = 0.04; AUC = 0.718, Sensitivity = 0.769, Specificity = 0.611). Immediately after initiation of treatment, SVR in G1 was predicted by IFI2 and JAK1 expression levels (Model p-value = 0.0005; AUC = 0.917, Sensitivity = 1.000, Specificity = 0.750). After a week of treatment, SVR in G1 patients was predicted by IRF4, BAG1, SOCS6, GMIP, LYN and SDCPB expression levels (Model p-value = 0.0014; AUC = 0.997, Sensitivity = 1.000, Specificity = 0.923), while for the entire CH-C cohort, it was predicted by NMI, PF4, BAG1, SOCS1, PDGFA and B2M expression levels (Model p-value < 0.0014; AUC = 0.989, Sensitivity = 1.000, Specificity = 0.929). At day 56, SVR in the entire CH-C cohort was predicted by the expression levels of NMI, IKBKB, RHOC, CD58 and PDGFA (Model p-value = 0.004, AUC = 0.917, Sensitivity = 0.750, Specificity = 1.000). On the other hand, in G1 patients, SVR was predicted by IL15 and COX17 expression levels (Model p-value = 0.00034, AUC = 0.962, Sensitivity = 0.875, Specificity = 1.000). CONCLUSIONS: A panel of non-invasive biomarkers is developed that can accurately predict SVR in NR CH-C patients. If validated, this biomarker panel can be useful in the management of HCV.

336 TREATMENT AND OUTCOME OF GENOTYPE 4 CHRONIC HEPATITIS C PATIENTS WITH PegINTERFERON Alfa 2B AND Ribavirin IN THE CLINICAL SETTING IN GERMANY

Dietrich Hüppe1, Elmar Zehnter2, Michael P. Manns3, Stefan Mauss4, Gerlinde Teuber5, Tarek Dahhan6, Ulrike Meyer7, Bernd Möller7, Nektarios Dikopoulos8, Thomas Wittthöft9, Jochen Brack10, Marek Stern11, Stephan Kaiser12, Renate Prinz13; . The bng hepatitis study group14; 1Medical Group Practice, Berlin, Germany; 2Gastroenterological Practice Dortmund, Dortmund, Germany; 3Medical High School Hannover, Hannover, Germany; 4Center for HIV and Hepatogastroenterology, Duesseldorf, Germany; 5Johann Wolfgang Goethe University, Frankfurt, Germany; 6Medical Practice, Backnang, Germany; 7Medical Practice, Berlin, Germany; 8University of Ulm, Ulm, Germany; 9University of Luebeck, Luebeck, Germany; 10Hospital Nord Ochsenzoll, Hamburg, Germany; 11Medical Practice, Frankfurt, Germany; 12University of Tuebingen, Tuebingen, Germany; 13essex pharma GmbH, Munich, Germany; 14Berufsverband Niedergelassener Gastroenterologen Deutschlands e.V., New Ulm, Germany

BACKGROUND: Pegylated interferon (Peg-IFN alfa) and Ribavirin (RBV) are standard of care for hepatitis C (HCV) treatment. Since there are no large controlled studies for genotype (GT) 4 patients (pts), available cohort data are of interest in order to better define response rates and suitable treatment strategies. METHODS: 280 sites (75 with GT 4 pts) have treated a total of 3948 HCV pts, of whom 123 were GT 4. The results of GT 4 pts who had reached an observational period beyond 72 weeks after baseline are described. Pts without available HCV-RNA data 24 weeks post therapy were counted as treatment failures. Data are analyzed using standard summary statistics. RESULTS: GT 4 pts had a mean age of 41 years, 61% (n=75) were male. 48% (n=59) were German, 7% (n=8) Italian, 12% (n=15) Egyptian, 4% (n=5) Ethiopian, and 4% (n=5) Turkish. 3% (n=4) of the pts showed cirrhosis and 6% (n=7) had HBV or HIV co-infection. 88% (108/123) of the pts received peg-IFN and RBV as primary therapy, 12% (15/123) were retreated after unsuccessful IFN mono-therapy. 39% (48/123) received standard PEG-IFN dose (1.5 mg/kg body weight), 33% (41/123) received lower and 25% (31/123) higher doses. 70% (87/123) received standard weight-dosed RBV (≥10.6 mg/kg body weight). Since the study is ongoing, only 74 pts have reached the end of therapy, yet, 28% (21/74) were treated for less than 24 weeks, 7% (5/74) were treated
24 weeks, 45% ([33/74]) were treated > 24 - ≤ 48 weeks and 20.3% ([15/74]) were treated for ≤ 48 weeks. As of yet, 50 pts have reached the 24 weeks follow-up after end of therapy. Normalization of ALT was seen in 50% ([25/50]) of the pts at follow-up. 42% ([21/50]) of the pts analyzed thus far showed sustained virologic response (SVR), 16% ([8/50]) relapsed, 24% ([12/50]) were non-responders, and 18% ([9/50]) were lost to follow-up or missing. The BMI index class ≥ 18 < 25 showed the highest SVR rate with 59% ([13/22]) followed by ≥ 25 < 30 with 50% ([7/14]) and the class ≥ 30 with 0% ([0/2]). In patients with baseline HCV-RNA < 600,000 IU/ml (LVL) SVR rate was 60% ([12/20]) and 47% ([8/17]) in the HVL group (≥ 600,000 IU/ml). More nonresponders were seen in the HVL group (41.2%; 7/17) than in the LVL group (15%; 3/20). No differences in SVR were observed between different treatment durations ≥ 25 weeks ≤ 48 weeks ([62%; 13/21]) and >48 weeks ([63%; 5/8]), whereas in the group <25 weeks only 25% ([3/12]) of the patients showed SVR. CONCLUSION: Efficacy of PEG-IFN alfa-2b and RBV in GT 4 patients is comparable, but not superior to results in genotype 1 patients.

BONE MINERAL DENSITY AND METABOLISM IN NON-CIRRHOTIC PATIENTS WITH CHRONIC HEPATITIS C BEFORE AND AFTER ANTIVIRAL THERAPY WITH PEGYLATED INTERFERON α AND RIBAVIRIN: A PROSPECTIVE CONTROLLED STUDY

Wolf P. Hofmann1, Bernd Kronenberger1, Joerg Bojunga1, Bettina Stamm2, Ulrike Mihm3, Michael von Wagner1, Eva Herrmann1, Stefan Zeuzem1, Christoph Sarrazin1; 1Internal Medicine 1, Johann Wolfgang Goethe-University, Frankfurt, Germany; 2Center for Endocrinology and Diabetes Saarbruecken, Saarbruecken, Germany; 3Internal Medicine II, Saarland University Hospital, Homburg / Saar, Germany

Introduction: The importance of osteoporosis as a complication of end-stage chronic liver disease is well known. However, significant osteopenia may already be present in non-cirrhotic patients with chronic hepatitis C (CHC). Furthermore, the administration of antiviral therapy may have an influence on bone metabolism. While interferon alfa has been shown to decrease bone resorption in vitro and may be beneficial for bone mineral density in vivo, less consistent data are available for ribavirin. Patients and Methods: Thirty non-cirrhotic patients with CHC genotype 1 infection were treated with peginterferon alfa and ribavirin for 48 weeks. Dual-energy x-ray absorptiometry was performed at baseline, after 48 weeks of therapy, and at the end of a 24-week follow up period. Bone mineral density (BMD), and T-scores / Z-scores were assessed. Additionally, levels of serum C-terminal propeptide of type I collagen, bone-specific alkaline phosphatase, and osteocalcin were measured. Results: Thirteen of the 30 non-cirrhotic patients had osteopenia (43%) and manifest osteoporosis was present in 4 patients (13%). Antiviral therapy led to a significant increase of femur neck and hip BMD (baseline vs end of treatment, p<0.05) as well as T-scores (p<0.05) and Z-scores (p<0.01). While in patients with sustained virologic response (n=19) most parameters remained highly above baseline values by the end of the 24-week follow up period, patients with virologic relapse (n=11) had a decrease of BMD, T-scores and Z-scores thereafter. Patients with sustained virologic response (n=19) most parameters remained highly above baseline values by the end of the 24-week follow up period, patients with virologic relapse (n=11) had a decrease of BMD, T-scores and Z-scores thereafter. While in patients with sustained virologic response (n=19) most parameters remained highly above baseline values by the end of the 24-week follow up period, patients with virologic relapse (n=11) had a decrease of BMD, T-scores and Z-scores thereafter.

Efficacy of Interferon-Based Antiviral Therapy in Patients with Chronic Hepatitis C Infected with Hepatitis C Virus Genotype 5: A Meta-Analysis of Two Large Prospective Belgian Clinical Trials

Francois D’Heygere1, Christophe George1, Hans Van Vlierberghe2, Filip Baert3, Antoine Nakad4, Michael Adler5, Frederik Nevens6, Annik Laureys7; 1AZ Groeninge, Kortrijk, Belgium; 2UZ Erasme, Brussels, Belgium; 3Hôpital Notre-Dame, Tournai, Belgium; 4Cliniques Universitaires Erasme, Brussels, Belgium; 5UZ Gasthuisberg, Leuven, Belgium; 6UZ Gasthuisberg, Leuven, Belgium;
7NV Roche SA, Brussels, Belgium

Hepatitis C Virus genotype 5 (HCV-5) response to interferon-based antiviral therapy is currently poorly documented and the best treatment regimen for this genotype has still to be determined. Comparing the sensitivity of genotype 5 (GNT 5) to treatment, with other better known genotypes should allow a better evaluation of response to treatment and help defining the optimal treatment regimen for GNT 5. Because of the small size of the GNT 5 population, it seems improbable that a study could be conducted in a large population of HCV-5 patients. For this reason, any prospective clinical trial on CHC patients should be used for a sub-group analysis of G5 response to treatment. So, in order to compare the efficacy of antiviral therapy on HCV-5 with other genotypes, a meta-analysis of two large phase III prospective randomized clinical trials conducted in Belgium in naïve patients and relapsers (BeRNaR 1 and BeRNaR 2) has been performed. Both studies were designed to evaluate the safety and efficacy of various interferon-based therapies in a large population of patients with chronic hepatitis C (CHC). In total, 1139 patients were recruited from October 2000 to May 2005 in both studies from which 48 (4.2%) were of GNT 5. The meta-analysis measured and compared patients’ characteristics, early viral responses, end-of-treatment responses, sustained viral responses (SVR) and relapse-rates between GNT 5 and other genotypes. A subset of HCV-1 infected patients was then selected from the studies database to match the HCV-5 sample according to age category (< vs. > 40), gender, baseline virus load (< vs. > 800,000 IU/mL), cirrhosis status (yes vs. no), pretreatment status (naïve vs. relapsers) and treatment received (only patients treated with the same regimen of pegylated interferon alpha-2a plus ribavirin were selected). In the sample of patients matched for these variables, the “intrinsic sensitivity” of HCV-5 was comparable to HCV-1 with a sustained viral response equal to 56% in both matched groups. The observed SVR in HCV-5 is close to what has been recently published by Bonny et al (2006) in this subgroup. This is the first comparative analysis of HCV-5 response to interferon-based therapy derived from large prospective randomized clinical trials. The study allows better characterization of the Belgian HCV-5 population and its response to treatment. It suggests that HCV-5 patients should be treated with the same treatment regimen as HCV-1 patients.

FACTORs IMPACTING SVR IN HCV GENOTYPE 1 PATIENTS WITH EVR AND WEEK 24 NEGATIVITY

Reem H. Ghalib, Cheryl Levine, Anisha Steephen, Abdullah Mubarak, Jeffrey Weinstein; Liver Institute at Methodist Dallas, Dallas, TX

Background: Current guidelines for treatment of chronic HCV utilize the EVR with ≥2 log decrease in virus as an indicator of patients who are likely to respond to therapy. Reports indicate a 72% SVR rate in patients with an EVR. The purpose of this study was to evaluate factors impacting the SVR rate in chronic HCV genotype 1 patients who have achieved an EVR at treatment week 12 with viral negativity at week 24. Methods: This was a retrospective cohort analysis of HCV genotype 1 patients treated with PEG IFN plus ribavirin. All patients who achieved an EVR and were HCV RNA undetected at week 24 of treatment were included. “Slow viral responders” had a ≥2 log decrease with detectable virus at week 12 achieving undetectable virus at week 24. Results: Total number of patients was 143 (92 men, 51 women). Age range was 22-70 (mean 47.1 ± 8.4). Race was White 112 (78%), Black 17 (12%), and Hispanic 14 (10%). Fibrosis was stage 0-1 in 21, stage 2 in 47, stage 3 in 31, and stage 4 in 34 patients. At treatment week 12, 107 (75%) patients achieved an undetectable HCV RNA with the remaining 26 (25%) patients being slow viral responders (Table 1). SVR rate in the group with undetectable virus at week 12 was 78% (p = 0.0001). In patients with slow viral response, the most important factor impacting SVR was the week 12 HCV RNA <100 IU/mL vs. ≥100 IU/mL with 10/20 (50%) and 0/16 (0%), respectively (p = 0.006). Additional factors demonstrating a trend in different SVR rates were race, baseline viral count, and PEG IFN used. Racial differences comparing White with non-White demonstrated a trend with 9/18 (33%) and 1/9 (11%), respectively (p = 0.2). Patients with high baseline viral load (>400,000 IU/mL) had lower SVR than those with low viral load (0/4 and 10/32, respectively, p = 0.25). In slow viral responders, SVR rate with PEG IFN alpha-2a vs. alpha-2b were 9% and 36%, respectively (p = 0.10). Conclusions: Slow viral responders, with a ≥2 log decrease but delayed viral clearance until week 24, have a significantly reduced chance of SVR with standard 48 week treatment than those with undetectable virus, 27% vs. 78% respectively. Significantly higher SVR rates were found in patients who were virus positive with HCV RNA level <100 IU/mL vs. ≥100 IU/mL at week 12. Trends toward lower SVR rates were also seen in difficult to treat patients: non-White race and high baseline viral count. Further investigation is needed to improve SVR rates in patients who are slow viral responders.

SILYMARIN PHARMACOKINETICS (PK) IS ALTERED IN PATIENTS WITH CHRONIC HEPATITIS C VIRUS (HCV) AND NONALCOHOLIC FATTY LIVER DISEASE (NAFLD) AND CORRELATES WITH CASPASE-3/7 ACTIVITY

Sarah J. Schriever¹, Zhiming Wen¹, Todd E. Dumas¹, Manoli Vourvahis¹, Philip C. Smith¹, Angela D. Khashuba¹, Michael W. Fried², Roy L. Hawke⁴, ¹School of Pharmacy, University of North Carolina at Chapel Hill, Chapel Hill, NC; ²School of Medicine, University of North Carolina at Chapel Hill, Chapel Hill, NC

Silymarin is commonly used by liver disease patients and is under investigation as a treatment for HCV and NAFLD. Silymarin, a mixture of 6 flavonoids with antioxidant activity, is metabolized by hepatic conjugating enzymes and the conjugates undergo significant biliary transport. Liver disease can alter the expression and function of conjugating enzymes and biliary transporters, which may impact silymarin’s PK. We studied the PK of silymarin flavonoids and their conjugates in patients and healthy subjects. Caspase-3/7 activity, cytokines, and oxidative stress were also measured as biomarkers of disease activity. Twenty subjects were enrolled: 5 healthy; 10 chronic HCV (5 with cirrhosis by biopsy); and 5 NAFLD by biopsy. Fasted subjects received a single oral 480 mg dose of standardized silymarin and 15 blood samples were obtained over 24 h. Plasma concentrations of silymarin flavonoids and their conjugates were determined by LC-MS before and after enzymatic hydrolysis. PK parameters were determined using a noncompartmental approach with WinNonlin®4.1. Plasma cytokine (R&D Systems®) and 8-isoprostane-F2α (8-isoPGF2α) concentrations were measured by enzyme-linked immunosorbent assay. Plasma caspase-3/7 activity was determined by luminescence (Promega®). Statistical analyses were performed using SAS JMP®6.0.0. Data are presented as means, with p<0.05 considered significant. Silymarin conjugate peak plasma concentrations (16-595 ng/ml) were >8-fold higher than for silymarin (4-76 ng/ml). 24 h exposures (AUC₀₋₂₄) for total plasma conjugates were 2.7, 3.0, and 5.1-fold higher for HCV noncirrhotic, NAFLD, and HCV cirrhotic (p=0.03 vs. healthy) patients, respectively, compared to healthy subjects (AUC₀₋₂₄=23.41 ng/ml*h). Elimination half-lives for total conjugates ranged from 8.10 h in disease cohorts vs. 4 h in the healthy cohort. Plasma caspase-3/7 activity correlated with AUC₀₋₂₄ for total silymarin conjugates among cohorts (R²=0.52) and was elevated in HCV cirrhotic patients compared to other cohorts (p<0.005). No differences were observed in plasma concentrations of 8-isoPGF2α or IL-6 among cohorts. Our results indicate that cirrhosis and elevated caspase-3/7 activity are associated with highest silymarin exposures in patients with liver disease. Therefore, silymarin may be useful for quantifying changes in disease stage. In addition, chronic dosing with silymarin may result in the accumulation of conjugates. Therefore, future clinical studies should include patients with advanced disease in order to determine the biological effects of silymarin conjugates. These findings will be confirmed in larger Phase 1/2 ongoing trials.

NEGATIVE IMPACT OF ABACAVIR ON RESPONSE TO PEGIFN PLUS RBV IN HIV/HCV COINFECTED PATIENTS

Pablo Barreiro¹, Eugenia Vispo¹, Ivana Maida², Juan A Pineda², José A Mira³, Ignacio Santos³, José A Girón³, Dolores Merino³, Antonio Rivero³, Vicente Soriano³, ¹Department of Infectious Diseases, Hospital Carlos III, Madrid, Spain; ²Hepatology Unit, Hospital Valme, Sevilla, Spain; ³Service of Infectious Diseases, Hospital La Princesa, Madrid, Spain; ⁴Service of Internal Medicine, Hospital Puerta del Mar, Cadiz, Spain; ⁵Service of Internal Medicine, Hospital Juan Ramón Jiménez, Huelva, Spain; ⁶Service of Internal Medicine, Hospital Reina Sofia, Córdoba, Spain

Background: The choice of antiretrovirals may influence outcome of pegylated-interferon (pegIFN) plus ribavirin (RBV) therapy. While didanosine and zidovudine have to be avoided due to greater risk of side effects, little is known on the influence of abacavir, which is a guanosine analog as RBV. Methods: All HIV/HCV patients receiving first-line pegIFN plus RBV therapy between 2002 and 2005 in three Spanish hospitals were retrospectively analyzed. Main demographics, HCV features and antiretrovirals were recorded. Baseline liver fibrosis and RBV plasma levels at week 4 were also available for a large subset of patients. Results: A total of 426 HIV/HCV patients (80% males, mean age 41 years, 80% on HAART, mean CD4 count 567 cells/µl) received at least one dose of pegIFN plus RBV. At baseline, mean HCV-RNA 5.8 log IU/ml, 65% genotypes 1 or 4, and 40% Metavir ≥F3. The SVR was 38% (G1/4, 26%; G2/3, 61%). Factors associated with non-SVR in the multivariate analysis [OR [95% CI] p] were: higher baseline HCV-RNA (10.31 [3.70-28.57] <0.001), HCV genotype 1/4 (7.75 [2.56-23.25] <0.001), Metavir (10.31 [3.70-28.57] <0.001), HCV genotype 1/4 (7.75 [2.56-23.25] <0.001), Metavir ≥F3 (4.03 [1.32-12.50] 0.01), and lower RBV plasma trough levels (1.64 [1.03-2.65] 0.04). The use of abacavir predicted non-SVR (2.04 [1.08-3.85] 0.03) when RBV levels were not included in the model. The negative impact of abacavir on HCV suppression was recognized at weeks 4, 12, 48 and 72. However, it was not appreciable in the subset of patients with RBV plasma trough levels >2.2 µg/ml. Conclusions: The use of abacavir is associated with a poorer response to pegIFN plus RBV in HIV/HCV patients. This negative impact may be overcome by high RBV exposure, suggesting that an inhibitory competition exists between RBV and abacavir.

SUSTAINED VIROLOGIC RESPONSE (SVR) TO PEGIFN PLUS RBV IN GENOTYPE-4 HCV-HIV COINFECTED PATIENTS

Luz Martin-Carbonero¹, Massimo Puoti2, Javier García-Samaniego¹, Miriam Romero¹, E. Losada³, A. Marriñó², K. Abiguerrergo², Marina Nuñez², Pablo Barreiro¹, Vicente Soriano³, ¹CIBEREDH, Hospital Carlos III, Madrid, Spain; ²CIVILI, Brescia, Italy; ³Hospital Clínico, Santiago de Compostela, Spain; ⁴Hospital Arquitecto Marcide, Ferrol, Spain; ⁵Hospital Cruces, Bilbao, Spain

Background: HCV Genotype 1 and 4 respond worse to pegylated interferon (pegIFN) plus ribavirin (RBV) therapy. For this reason most patients with advanced disease are treated interferon (pegIFN) + ribavirin (RBV). For this reason most trials genotype 4 sample is small, and real factors associated with response can be biased. Methods: All genotype 4 HIV/HCV infected patients who received treatment with pegIFN+RBV in...
two different multicentric studies (PRESCO and ROMANCE) were retrospective analyzed. Baseline viral load (BVL), undetectable HCV-RNA at week 4 (RVR), decrease of 2 log at week 12 (EVR) were assessed as predictive factors of response. Results are given median (IQR) and percentage. Univariate and multivariate logistic regression analysis was performed. Results: Overall, 75 patients (60 men) were evaluated. Median age and CD4 cell count were 40 and 598, respectively. 49% of patients had HIV-RNA < 50 copies/ml, 71% had elevated aminotransferase levels and 31% had F3-4 fibrosis. Median HCV BVL was 5.7 log/ml. RVR was obtained in 10 (20%) patients and EVR in 26(42%). In an intention to treat (ITT) and on-treatment analysis (OTT), sustained virological response (SVR) was achieved in 21/75 (28%) and 21/62 (34%) of patients, respectively. In the multivariate analysis (OTT) BVL OR for every log increment 0.8 95%CI:0.008-0.8) and EVR OR 95%CI:1.3-30.8) were independently associated with SVR. HCV baseline cut-off to predict response could not be established, as sensitivity was low: the best cut-off was 5.7 log HCV-RNA with a sensitivity of 0.3. Conclusion: In this large series of patients with HCV-4/HIV coinfected treated with pegIFN+RBV we confirm than genotype 4 is a difficult to treat genotype. BVL and RVR are the best predictors of response. However, we could not establish a good baseline HCV-RNA cut-off to predict response.

344 DETERMINING SUITABLE INTERFERON TREATMENT PHASE USING ACUTE HEPATITIS C CELL CULTURE MODEL

Meng Sheng-Xi, Kato Naoya, Shao Run-Xuan, Muroyama Ryosuke, Chang Jin-Hai, Kawabe Takao, Omata Masao; Gastroenterology, University of Tokyo, Tokyo, Japan

Background & Aims: Interferon (IFN) had been widely used in the treatment of hepatitis C. We first reported that IFN treatment is highly effective against acute hepatitis C (Oomata et al. Lancet 1991). However, suitable IFN treatment phase, namely when to start IFN treatment against acute hepatitis C, has not been determined. Moreover, it has become difficult to perform clinical study of acute hepatitis C treatment because of decrease in number of acute hepatitis C after introduction of anti-HCV screening. Recently, a robust genotype 2a hepatitis C virus (HCV) full-length replication and infection system has been established. Thus, we also established this system and tried to determine suitable IFN treatment phase against acute hepatitis C using this system. Methods: First, we transfected JFH1 HCV RNA into Huh7 cells, and then collected supernatant for infection. Huh7 cells were infected with JFH1 HCV, and 20-160 IU/ml of IFNα2b was added to cells for 4 or 8 days at 1, 3, 7, 11, 13, 17, 21, or 25 days after infection. Cells were observed for 3 months after the end of IFN treatment. HCV core protein amount in the supernatant of infected cells was sequentially measured and HCV RNA in the supernatant of infected cells just after IFN treatment was examined. Results: The peak of HCV replication was 11 days after infection. Thereafter, HCV replication was decreased and fluctuated. IFN dose-dependent and duration-dependent decrease of HCV core protein in the supernatant was observed. End of treatment response was achieved when IFN was added 13, 17, 21, or 25 days after infection. Sustained viral response was achieved when IFN was added 13, 17, or 25 days after infection. Conclusions: The most effective phase of IFN treatment in acute hepatitis C cell culture model was after the peak of HCV replication. Full-length HCV infection system is useful not only to examine the effect of antivirals, but also to determine the suitable treatment phase.

345 RE-TREATMENT WITH PEGYLATED INTERFERON PLUS WEIGHT-ADJUSTED RIBAVIRIN IN HIV+ PATIENTS WITH CHRONIC HEPATITIS C: THE PILOT-NR STUDY

Pablo Labarga1, Eugenia Vispo1, Pablo Barreiro1, Javier Garcia-Samaniego2, Sonia Rodriguez-Novoa1, Carol Castellares1, Arancha Amor1, Vicente Soriano1; 1Department of Infectious Diseases, Hospital Carlos III, Madrid, Spain; 2Hepatology Unit, Hospital Carlos III, Madrid, Spain

Background: The efficacy of IFN-based therapy is lower in patients with chronic hepatitis C and HIV coinfection. The number of HCV/HIV patients that failed to clear HCV with suboptimal therapy in the past has increased rapidly. They might be good candidates for re-treatment with pegIFN plus weight-adjusted RBV. Methods: Prospective study of therapy with pegIFNα2a (180 µg weekly) plus RBV (<75 kg: 1000/d; >75 kg: 1200 mg/d) for 12 months in HIV/HCV patients non-responders or relapsers to a suboptimal IFN-based therapy. Main endpoint was the achievement of SVR. Advanced liver fibrosis (ALF) was defined as >9.5 kPa using FibroScan. RBV plasma trough levels were measured by UVHPLC. Results: A total of 51 patients were included (80% males; mean age 42 years; mean CD4 count 696 cells/µl; 90% on HAART; 89% with undetectable HIV-RNA; mean HCV-RNA 6.1 log IU/ml; 72% G1-4; 59% with ALF). Prior suboptimal regimens were IFN monotherapy (23%), IFN+RBV (27%) and pegIFN+RBV 800 mg/d (50%). Mean length of these treatments was 6.6 months. Overall, 64% were non-responders and 36% relapsers. Re-treatment with pegIFN+RBV provided SVR in 39% of patients (27% for G1-4 vs 70% G2-3; p=0.02 ). SVR was lower in non-responders than relapsers (30 vs 58%; p=ns), as in patients with ALF vs non-ALF (18 vs 60%; p=0.02). RBV plasma trough levels at week 4 were comparable between SVR and non-SVR (2.53 vs 2.13 ug/ml). In the multivariate analysis, factors independently associated with the attainment of SVR (OR [95% CI] p) were: non-ALF (50 [2.12-100] p=0.02), lower baseline HCV-RNA log IU/ml [16 (1.5-166)] p<0.05) and G2-3 (33.3 [1.03-166] p=0.05). Conclusions: Re-treatment with pegIFNα2a plus weight-adjusted RBV for 12 months allows HCV clearance in a significant proportion of HIV/HCV patients. The better chances of HCV eradication were seen in patients with mild liver fibrosis, low HCV-RNA, and G2-3.

346 FEASIBILITY OF COMBINATION THERAPY FOR CHRONIC HEPATITIS C IN IVDU IN THE FRAMEWORK OF AN HEROIN DETOXIFICATION PROTOCOL

Antonio Ciacchio1, Donatella Ferraro2, Giuseppe Alaimo1, Anna Amaria Maggio3, Antonia Craxi1, Piero L. Almasio1; 1Gastroenterology and Hepatology Unit, Palermo, Italy; 2Virology Unit, Palermo, Italy; 3SERT A.S.L. 6, Palermo, Italy

Background and aims. HCV infection is highly prevalent among intravenous drug users (IVDU), but only few receive standard-of-
care antiviral treatment albeit small-scale studies suggest feasibility of treatment in this cohort, but also high rates of withdrawal from therapy affecting its efficacy. We aimed to assess adherence and sustained viral response (SVR) to therapy in a cohort of HCV-infected drug addicts within the framework of an heroin detoxification protocol. Patients and protocols. Sixty-seven consecutive anti-HCV positive IDU patients currently on methadone or buprenorphine were referred to a Liver Unit by 4 Addiction Centres, to considered for antiviral therapy. PEG-interferon alfa-2b 1.5 µg/wk and Ribavirin 800-1,400 mg/day according to body weight were given for 24 (genotype 2 or 3) or 48 weeks (genotype 1 or 4), and observed for 24 weeks thereafter. Patients were followed for the entire period directly by the Addiction Centre. Results. Seven patients were excluded (3 being HCV RNA negative, 3 because of alcohol abuse, one for morbid obesity) and 60 were treated. This analysis is conducted on 41 subjects who have completed treatment and follow-up at the current time. Thirty-nine were males (mean age 32.4 yrs, mean duration of IVDU 9.1 yrs). Sixteen patients had HCV genotype 1, 2 genotype 2, 17 genotype 3 and 1 genotype 4. The overall withdrawal rate under therapy was 44%. Seventeen out of 22 (77%) patients who prematurely discontinued therapy were classified as early drop-outs (discontinuation within the fourth week): in all cases but one, the cause of discontinuation was primary non-compliance. Sustained viral response was 34% (18% in G1-4 and 41% in G2-3) on intention to treat analysis and 73% (40% in G1-4 and 100% in G2-3) by per protocol analysis. None of the patients enrolled was lost to the heroin detoxification program. Both the mean time of abstinence from IVDU and the mean duration of former IVDU were comparable between the patients with adequate and those with suboptimal adherence. Remarkably, adherence to the antiviral regimen was higher in the group treated with buprenorphine than in methadone maintenance (8 out of 14, 57.1% vs. 4 out 17, 23.5%, p = 0.06). Conclusions. Patients with chronic hepatitis C on an heroin detoxification regimen may be effectively treated with PEG-Interferon and ribavirin, without any unexpected side effect or loss of efficacy of the opioid maintenance regimen. The high rate of voluntary discontinuation (mostly within the first 4 weeks of therapy) cannot be predicted by sociodemographic factors, but buprenorphine may be more effective than methadone in helping the patients to adhere to the schedule.

347 DESCRIPTION OF PATIENTS WITH VIRAL BREAKTHROUGH DURING PEG IFN AND RIBAVIRIN TREATMENT FOR CHRONIC HCV GENOTYPE 1

Reem H. Ghalib, Cheryl Levine, Anisha Steephen, Abdullah Mubarak, Jeffrey Weinstein; Liver Institute at Methodist Dallas, Dallas, TX

Purpose: The purpose of this study was to evaluate factors impacting viral breakthrough in patients undergoing PEG/RBV treatment for hepatitis C genotype 1. Methods: This was a retrospective cohort analysis of HCV genotype 1 patients treated with pegylated interferon alpha-2b plus weight-based ribavirin from 2003 to present. All genotype 1 patients who were HCV RNA undetectable prior to week 24 of treatment were included in the sample. Results: The total number of genotype 1 patients who underwent treatment was 431 with 209 achieving an undetectable HCV RNA prior to week 24 of treatment. The number of patients with documented viral breakthrough was 22 (17 males and 5 females). Age range was 24-58 (mean 45.8 ± 6.6). Race distribution was White 13 (59%), Black 7 (32%), Hispanic 1 (5%) and Asian 1 (5%). Fibrosis was stage 0-1 in 3, stage 2 in 11, stage 3 in 4, and stage 4 in 4 patients. BMI was normal in 6 (27%), overweight in 6 (27%), and obese in 10 patients (45%). Baseline viral load was <400,000 IU/mL in 6 (27%) and >800,000 IU/mL in the remaining 16 (73%). At treatment week 4, 1 patient was HCV RNA undetectable with a viral breakthrough prior to week 12. At week 12, 9 patients had HCV RNA undetectable with viral breakthrough in 4 prior to week 24, 2 prior to week 40, and 3 at week 48. The other 12 patients had undetectable virus on or before week 24 with viral breakthrough in 1 prior to week 24, 8 prior to week 40 and 3 at week 48. During treatment, 7 patients (32%) were noncompliant with dosing (2 with ribavirin, 1 with IFN and 4 with both), 9 patients (41%) had dose reductions (5 with ribavirin, 1 with IFN and 4 with both), and the remaining 5 (23%) patients were all viral undetectable by week 12 and had no known noncompliance or dose reductions of medications. Conclusions: The majority of patients who suffered a viral breakthrough during treatment with Peg/RBV for chronic hepatitis C had experienced either dose modifications or were noncompliant with dosing of one or both medications. However, viral breakthrough happened in some genotype 1 patients with favorable predictors of SVR, including low viral load and week 4 and 12 negativity, when neither dose modification nor noncompliance to medications occurred. This data emphasizes the importance of maintaining compliance during HCV treatment even when undetectable levels of virus have been attained.

348 EXTENDING ANTIVIRAL TREATMENT FOR 12 MONTHS AFTER HCV-RNA CLEARANCE IS ASSOCIATED WITH A HIGH RESPONSE RATE IN DIFFICULT-TO-TREAT HCV PATIENTS

Anna Riti1, Annagiovanna Gramenzi1, Carmela Cursaro1, Marilena Salerno2, Francesco Felline1, Alessandra Scutieri1, Ranka Vukotic1, Giovanni Vitale1, Lucija Pirillo1, Mauro Bernardi1, Pietro Andreone1; 1Department of Internal Medicine, Cardioangiology and Hepatology, University of Bologna, Bologna, Italy; 2Epidemiology, Ospedale di Paola, Paola (CS), Italy; 3Medicina Generale, Crotone, Italy

Background: difficult-to-treat patients with chronic hepatitis C constitute a large number of heterogeneous patients characterized to resistance to standard antiviral treatment mainly due to a slow HCV-RNA clearance. Recently, it has been suggested that extension of treatment to 72 weeks improves the response in this subset of pts. Methods: we enrolled 65 difficult-to-treat genotype 1 HCV pts (38 males, mean age: 54±11 yrs) defined by at least one of the following criteria: HCV-RNA serum levels ≥6x10^5 UI/ml (36 pts), presence of cirrhosis (10 pts), nonresponse to previous antiviral treatment (31 pts). Patients were treated with Peg-IFNα2b 1.5 mg/kg plus Ribavirin 800-1,200 mg/dy. HCV-RNA was assayed monthly during the first 6 months and pts resulting HCV-RNA negative (<50 UI/ml) continued the treatment for further 12 months starting since the
moment of HCV RNA negativization. After 6 months pts who did not achieve a HCV RNA negativization, withdrew from the study and were considered non-responders. Study end-point was undetectable HCV RNA 6 months after treatment cessation (SVR). Results: HCV RNA was negative in 5 pts (8%) after one month of treatment, in 8 (12%) after two, in 25 (39%) after three, in 6 (9%) after four, in 4 (6%) after five and in 9 (14%) after six months. Eight pts (12%) did not achieve HCV RNA negativization within the first six months and stopped treatment. Up to now 61 patients completed the treatment period and 46 the 6 month of follow-up. A SVR was obtained in 30/46 pts (65%). The absence of cirrhosis and the naïve status were the only predictive factors of SVR (p=0.009 and p=0.005, respectively). Conclusions: extending antiviral treatment for 12 months after HCV RNA negativization is a rational approach to treat HCV difficult-to-treat patients. Although the study population was heterogeneous, this type of patients are not selected and very commonly encountered in the medical practice and it is crucial to define a treatment strategy in this setting.

349 ULTRA RAPID VIROLOGIC RESPONSE PREDICTS SUSTAINED VIROLOGIC RESPONSE IN HCV INFECTED PATIENTS WITH GENOTYPE 3 AND HIGH VIRAL LOAD: THE GET-C STUDY

Stephen Pianko1, William Sievert1, Ed Gane2, Hugh Harley2, Scott D. Bowden4, Rhonda McCaw4, Pip Palmer5, Margaret Perlman5, Kylie McCelland6, Carmella Law5, GEL-C Investigators1; 1Gastroenterology Department, Monash Medical Centre, Melbourne, VIC, Australia; 2Auckland Hospital, Auckland, New Zealand; 3Royal Adelaide Hospital, Adelaide, SA, Australia; 4VIDRL, Melbourne, VIC, Australia; 5Schering Plough Pty Ltd, Sydney, NSW, Australia

Aim: To assess the impact of viral clearance at week 2 of therapy on the sustained virologic response (SVR) rate of HCV genotype 3 infected patients with a high viral load. Methods: The GET-C 3 (GET-C trial) is an ongoing study designed to evaluate extended therapy in genotype 3 patients with a baseline viral load >400,000 IU/ml. Patients were randomized to receive Peg IFN alpha 2b 1.5ug /kg per week plus weight based ribavirin for 24 or 48 weeks. We assessed the predictive value of a week 2 and week 4 virologic response on the sustained virologic response rate. Viral load was determined using the Versant HCV RNA 3.0 BDNA assay (Bayer Diagnostics) (limit of detection 615 IU/ml) at baseline, week 2, 4, 12, 24, 36, 48 and 72 where applicable. All data was collected in an electronic case record form. Statistical analysis was performed using the Fisher’s Exact Chi Square two-tailed test. Results: Baseline demographics were similar in responders and non responders. To date, of the first 43 patients who have completed therapy and follow up, 42 patients had week 2 virologic data available. Of 42 patients, 30 (71%) achieved viral suppression to below 615 IU/ml at week 2. Of those who achieved this, 28 had an SVR with a positive predictive value (PPV) of 93%. 12 patients did not clear virus by week 2, of these, 5 did not have an SVR with a negative predictive value (NPV) of 42%. The impact on SVR of achieving a viral load reduction to <615IU/ml at week 2 was statistically significant (p=0.011). Of 42 patients, 39 (93%) were below 615 IU/ml at week 4. Seven patients who were positive at week 2 were negative at week 4 and 4/7 achieved a SVR (57%). Conclusion: An ultra-rapid virologic response at week 2 was highly predictive of SVR (PPV 93%). These data in 42 genotype 3 patients with high viral load suggest that week 2 may be a useful time for predicting SVR. Patients who fail to attain an undetectable viral load by week 2 have a significantly reduced chance of achieving a SVR and may benefit from extended therapy, which is being evaluated in the GET-C study.

350 CLINICAL RELEVANCE OF THE INTERFERON-ACTIVATED 2′-5′-OLIGOADENYLATE SYNTHETASE (OAS)/RNASE L SYSTEM FOR TREATMENT SUCCESS IN CHRONIC HEPATITIS C

Ulrike Mihm1, Oliver Ackermann1, Christoph Welsch1,2, Eva Herrmann1, Natalia Grigorian1, Martin W. Welker1, Wolf Peter Hofmann1, Mario Albrecht1, Thomas Lengauer1, Stefan Zeuzem1,4, Christoph Sarrazin1,4, Klinik für Innere Medizin II, Uniklinikum des Saarlandes, Homburg, Germany; 2Abteilung Bioinformatik und Angewandte Algorithmen, Max-Planck Institut für Informatik, Saarbrücken, Germany; 3Medizinische Fakultät, Universität des Saarlandes, Saarbrücken, Germany; 4Medizinische Klinik I, Klinikum der Johann Wolfgang Goethe Universität, Frankfurt, Germany

Background: Interferon-alfa (IFN) induces the 2′-5′-oligoadenylate synthetase (2′-5′-OAS)/RNase L system for treatment success in chronic hepatitis C is unknown.

Methods: Nucleotide sequences coding for non-structural and structural proteins of the hepatitis C virus (HCV) have been investigated for an association between response towards an IFN-based therapy and the number of RNase L cleavage sites in patients with HCV genotypes 1b and 3a (HCV 1b: NS5A, n=45; E2/PePHD, n=41; CD81/HVR2, n=38; HCV 3a: NS5A, n=33; E2/PePHD, n=33; CD81/HVR2, n=17). In 5 patients with HCV 1b infection and non-response to IFN-based therapy the frequency of RNase L cleavage sites within NS5A and NS4B has been evaluated during therapy (baseline, treatment weeks 4 and 48; follow up week 12).

Nucleotide sequences of isolates from patients with HCV 1b and 3a infection were compared with respect to the number of RNase L cleavage sites (HCV 1b: NS5A, n=45; E2/PePHD, n=41; CD81/HVR2, n=38; HCV 3a: NS5A, n=33; E2/PePHD, n=33; CD81/HVR2, n=17). Results: No significant association was observed between response to antiviral therapy and the number of RNase L cleavage sites in HCV NS5A, E2/PePHD or CD81/HVR2 nucleotide sequences in patients with HCV 1b or 3a infection. The frequency of RNase L cleavage sites in HCV NS4B and NS5A did not differ significantly at different time points during antiviral therapy and follow up in 5 patients with HCV 1b infection. Patients with HCV genotype 3a infection showed more UU cleavage sites within NS5A and E2/PePHD compared to patients with HCV 1b infection (p=0.001). The number of UA cleavage sites was not different between isolates from HCV 1b and 3a infection.

Conclusions: No association between the frequency of
The occurrence of depression was reported in 20-30 % of cases in the studies which assessed peginterferon alfa and ribavirin in chronic hepatitis C. However, in these studies the diagnosis of depression was based only on the clinical impression of the investigators. Aims: The aims of our study were to evaluate the incidence of depression during the treatment with peginterferon alfa-2a plus ribavirin in chronic hepatitis C in the real life with the help of the Mini-International Neuropsychiatric Interview (MINI), a short structured diagnostic interview for DSM-IV and ICD-10 psychiatric disorders and to make the correlation between the MINI results and the diagnosis made by the clinician and with the Beck Depression Inventory score (BDI). Patients and methods: 150 HCV mono-infected patients treated with peginterferon alfa-2a plus ribavirin are expected to be enrolled in this multicentric study. The incidence of depression will be assessed at baseline, at weeks 4, 12, 24, at the end of the treatment and at the end of follow up with the MINI, the clinician feeling and the BDI score. Results: The results from baseline week 12 of the 123 first enrolled patients are presented in this intermediate analysis. The baseline patients characteristics were as follows: mean age: 48 years, male: 73 (59 %), history of psychiatric events 30 (24 %), genotype 1: 67 (54 %), F3-F4 fibrosis: 45 (37 %), naive patients: 73 (59 %). At baseline, the MINI revealed a current major depression in 9 patients (7 %), 7 received anti-depressant therapy before (n=5) or after (n=2) the beginning of peginterferon. Between the baseline and week 12, 21 (18 %) major depressions were diagnosed by the MINI. In 16 cases (76 %), the clinicians considered that there was no depression. Finally, an anti-depressant therapy was started in 17 cases (81 %). On the other hand, in 7 cases (6 %) the diagnosis of major depression was made by the clinician but not confirmed by the MINI. The correlation between the MINI and the BDI was poor. Conclusion: The incidence of depression between the baseline and week 12 was of 18 %. Major depression seems to be under-diagnosed by the clinicians. The systematic use of Mini-International Neuropsychiatric Interview (MINI), a short structured diagnostic interview for DSM-IV psychiatric disorders may be of interest during peginterferon therapy. This study was supported by Roche.

353 COMBINATION THERAPY WITH PEGYLATED INTERFERON ALFA-2B AND RIBAVIRIN FOR PATIENTS WITH CHRONIC HEPATITIS C AND NORMAL AMINOTRANSFERASE LEVELS

Yoshiaki Katano, Masatoshi Ishigami, Isao Nakano, Kazuhiko Hayashi, Takashi Honda, Hidemi Goto; Gastroenterology, Nagoya University Graduate School of Medicine, Nagoya, Japan

Background/Aim: Combination therapy with pegylated interferon (PEGIFN) and ribavirin is standard therapy for patients with chronic hepatitis C (CHC). There is evidence that patients with CHC and persistently normal alanine aminotransferase (PNALT) levels respond similarly to those with elevated alanine aminotransferase (ALT) levels to treatment with interferon and ribavirin, however, such data with PEGIFN alfa-2b and ribavirin are currently few. The aim of this study was to evaluate whether patients with PNALT levels and patients with elevated ALT levels respond similarly to the combination therapy with PEGIFN alfa-2b and ribavirin. Methods: 299 chronic hepatitis patients infected with hepatitis C virus (HCV) genotype 1 were treated with PEGIFN alfa-2b 1.5 µg/kg/wk plus ribavirin 600-1000 mg/d for 48 weeks. Among this group 54 patients, had at least 3 normal ALT levels over the 3 months prior to treatment, were defined as patients with PNALT levels. The evaluation of efficacy was sustained virologic response (SVR), defined as undetectable serum HCV RNA at 24 weeks after completion of treatment. Results: Liver histology in patients with PNALT levels were significantly milder compared with that in patients with elevated ALT levels. Overall, 50.0% of patients with PNALT levels and 43.7% of those with elevated ALT levels were SVR (p=0.395). In male, SVR rates of 46.4% and 51.8% were obtained in the PNALT group and elevated ALT group, respectively (p=0.605). In female, SVR rates of 53.9% and 31.7% were obtained in the PNALT group and elevated ALT group, respectively (p=0.036). Conclusions: The efficacy of PEGIFN alfa-2b and ribavirin combination therapy in CHC patients with PNALT levels is similar to that in patients with elevated ALT levels. In particular, female patients with PNALT levels should be considered for curative therapy.

Disclosures: The following people have nothing to disclose: Yoshiaki Katano, Masatoshi Ishigami, Isao Nakano, Kazuhiko Hayashi, Takashi Honda, Hidemi Goto

354 THE ROLE OF STEATOSIS AND DIABETES AS A PREDICTOR OF TREATMENT RESPONSE TO INTERFERON BASED THERAPIES IN LATINO AMERICANS WITH CHRONIC HEPATITIS C

Edward A. Mena¹, Orlinda E. Ventura¹, Lawrence M. Blatt²,³, Myron J. Tong¹²; ¹HMRI Liver Institutes, Pasadena, CA; ²Liver transplant, UCLA, Los Angeles, CA

Background: The role of nonalcoholic steatohepatitis (NASH) must be considered as a predictor of response to interferon based therapies in the Latino population. The aim of this study is to determine if steatosis and diabetes influence sustained virologic response (SVR) rates. Understanding the pathophysiology of NASH could help clarify pharmacological options and defining the role of treatment of NASH in overall treatment of HCV. Methods: Retrospective chart review of 205 Latino Americans referred to the HMRI Liver Center. Steatosis was defined as having fatty infiltration or balloon degeneration on liver biopsy. Diabetes was defined as having a fasting sugar greater than 126. SVR was defined as being RNA negative 6 months after interferon based therapy. Chi-square, Hest and logistic regression were performed. Results: Of the 205 patients, 67% were born in the USA, 23% were born in Mexico, and 10% were from a country in Central or South America. The mode of acquisition were: 42% tattoo, 40% transfusion, 37% IVDA, and 37% cocaine. The mean age this population was 52 yrs (range 25-82), mean weight 178 lbs (range 114-296), and the mean BMI was 28 (range 21-44). In 136 with liver biopsies; 67% had steatosis. Also ultrasound reports in 177 patients showed that 50% had radiographic evidence of steatosis. The most common genotype was 1 65%, 2 24%, and 3 10%. There were 79 patients treated for Hepatitis C. The majority of patients received pegylated interferon with weight based ribavirin 66%. The sustained virologic response rate to interferon based therapies for all genotypes was 36%. The nonresponder rate (NR) was 44% and the rebound rate (RR) was 14%. In Genotype 1 the SVR 23%, NR 60%, RR 17%. For Genotype 2 the SVR 76%, NR 18%, RR 6%. In Genotype 3 the SVR 38%, NR 50%, RR 13%. We found no statistical difference for SVR between age, weight, BMI, steatosis, diabetes, and cirrhosis. However there were trends of clinical relevance. Table 1 Summary: There were no statistical differences in SVR with respect to weight, BMI, diabetes. This may be due to the low samples size of the population. However, there were trends that need to be further analyzed. 67% of our population had steatosis on liver biopsy. Patients with steatosis on biopsy tended to have a lower SVR (33%) compared to those with no steatosis (46%). The diabetic patients had a lower SVR of (26%) compared to our non-diabetic patients with an SVR of (40%).

355 HEPATITIS C VIRUS (HCV) TREATMENT OUTCOMES WITH CONSENSUS INTERFERON WITH OR WITHOUT RIBAVIRIN IN PEGINTERFERON/RIBAVIRIN NON-RESPONDERS/RELAPSERS: RESULTS FROM NATIONAL CLINICAL PRACTICE SETTINGS

Helen S. Yee¹,², Kathy Tortorice³, Summer Chapman³, Fran Cunningham³, Sue Currie²,¹; ¹Gastroenterology, Department of Veterans Affairs Medical Center, San Francisco, San Francisco, CA; ²University of California, San Francisco, San Francisco, CA; ³Pharmacy Benefits Management Strategic Healthcare Group, Hines, IL

Background: Approximately 50% of chronic hepatitis C patients who receive current standard of therapy (peginterferon alfa plus ribavirin) are nonresponders to treatment. Currently, there is no FDA-approved treatment for HCV nonresponders or relapsers to peginterferon alfa plus ribavirin. Despite limited published data and limited criteria for use, some providers may consider using consensus interferon (CIFN, Infergen®) in combination with ribavirin as a treatment option in these patients. To date, there have not been any large studies evaluating provider practice patterns and treatment outcomes of CIFN in HCV nonresponders or relapsers to peginterferon alfa plus ribavirin. Objective: To evaluate treatment outcomes and utilization patterns of CIFN with or without ribavirin in chronic HCV
CARCINOMA IN PRIMARY SCLEROSING CHOLANGITIS

TECHNIQUES FOR THE DETECTION OF CHOLANGIOCARCINOMA

Cholangiographic findings suspicious for the diagnosis of CC included a polypoid bile duct lesion or a dominant stricture with or without proximal biliary dilatation. Serum CA19-9 combined with either US, CT, or MRI provided a sensitivity of 91%, 100%, and 96%, specificity of 62%, 38%, and 37%, positive predictive value (PPV) of 23%, 22%, and 24%, and negative predictive value (NPV) of 98%, 100%, and 98%, respectively, if at least one method was positive. In the clinical context of patients with biliary strictures plus either CA19-9 > 20.4 U/ml or suspicious findings on cross-sectional images, routine cytology, aneuploidy detection by digital imaging analysis, and aneusomy detection by fluorescent in situ hybridization yielded a sensitivity of 50%, 57%, and 86%, specificity of 97%, 90%, and 75%, PPV of 88%, 80%, and 71%, and NPV of 83%, 75%, and 88%, respectively. Conclusions: No individual test is a perfect tool. Serology combined with radiologic method provides high sensitivity and NPV whereas biliary cytologic examination provides high specificity and PPV for the diagnosis of CC in PSC. These may be useful for the early detection of CC in patients with PSC.

356

THE VALUE OF SERUM CA 19-9, ULTRASONOGRAPHY, COMPUTED TOMOGRAPHY, MAGNETIC RESONANCE, CHOLANGIOGRAPHY, AND BILIARY CYTLOGIC TECHNIQUES FOR THE DETECTION OF CHOLANGIOCARCINOMA IN PRIMARY SCLEROSING CHOLANGITIS

Phunchai Charatcharoenwitthaya, Keith D. Lindor; Division of Gastroenterology and Hepatology, Medicine Department, Mayo Clinic, Rochester, MN

Background & Aims: There is limited information on test performance for detecting cholangiocarcinoma (CC) in primary sclerosing cholangitis (PSC). This study aimed to characterize diagnostic performance of serum CA19-9, US, CT, MRI, cholangiography, and biliary cytologic techniques for detecting CC in PSC. Methods: Two hundred and thirty patients with PSC were followed until the development of CC from 2000 through 2006. During this time, 23 of these patients developed cytopathologically confirmed CC. Patients were considered free of CC if they had no evidence of CC at least 1 year of follow-up. Results: The annual incidence of CC was 2.0%. According to the TNM classification for CC, 15 (65%) patients had stage I-II, one had stage III, and seven had stage IV. Operative characteristics of each test for predicting CC in PSC were summarized in the Table. The optimal cutoff value for serum CA19-9 is 20.4 U/ml. Bile duct cancers should be suspected if there is a liver mass, marked bile duct wall thickening, marked biliary dilatation, or focal intrathoracic biliary dilatation associated with ipsilateral lobe atrophy on cross-sectional images of the liver. Cholangiographic findings suspicious for the diagnosis of CC included a polypoid bile duct lesion or a dominant stricture with or without proximal biliary dilatation. Serum CA19-9 combined with either US, CT, or MRI provided a sensitivity of 91%, 100%, and 96%, specificity of 62%, 38%, and 37%, positive predictive value (PPV) of 23%, 22%, and 24%, and negative predictive value (NPV) of 98%, 100%, and 98%, respectively, if at least one method was positive. In the clinical context of patients with biliary strictures plus either CA19-9 > 20.4 U/ml or suspicious findings on cross-sectional images, routine cytology, aneuploidy detection by digital imaging analysis, and aneusomy detection by fluorescent in situ hybridization yielded a sensitivity of 50%, 57%, and 86%, specificity of 97%, 90%, and 75%, PPV of 88%, 80%, and 71%, and NPV of 83%, 75%, and 88%, respectively. Conclusions: No individual test is a perfect tool. Serology combined with radiologic method provides high sensitivity and NPV whereas biliary cytologic examination provides high specificity and PPV for the diagnosis of CC in PSC. These may be useful for the early detection of CC in patients with PSC.

VALIDATION STUDY OF THE PROGNOSTIC IMMUNOHISTOCHEMICAL MARKER GLYPICAN-3 IN HEPATOCELULAR CARCINOMA

Sara Vander Borght1, Tineke Cornelis1, Louis Libbrecht1, Luca Di Tommaso2, Massimo Roncalli1, Tania Roskams1; 1Morphology and Molecular Pathology, University Hospitals Leuven, Leuven, Belgium; 2Pathology, University of Milan School of Medicine and IRCCS humanitas Clinical Institute, Milan, Italy

Distinguishing an early hepatocellular carcinoma (HCC) from benign and pre-malignant small focal lesions (dysplastic foci, low-and high grade dysplastic nodules) that occur in liver cirrhosis can be difficult but important to provide patients with the most appropriate treatment. Several groups reported the potential use of glypican-3 (GPC-3) in the diagnosis of small early HCC. For clinical use it is important to validate the reproducibility of the immunohistochemical staining of GPC-3 in the same lab as in different pathology labs around the world. We performed immunohistochemistry for GPC-3 on 8 low-grade dysplastic nodules, 19 high-grade dysplastic nodules, and 38 HCCs with a diameter less or equal to 3 cm present in the cirrhotic liver of patients. We tested the reproducibility of the GPC-3 marker on the same set of biopsies inside the same institution (Leuven, Belgium) with a 2 year interval and in a second institution (Milan, Italy). The sensitivity and specificity of a positive GPC-3 staining for the diagnosis of small HCC is summarized in Table 1. The intra- and inter-laboratory reproducibility of the staining was > 95%. Because GPC-3 staining is easily interpretable and internationally reproducible, immunohistochemistry for GPC-3 is a valuable ancillary tool in the histopathological diagnosis of small focal lesions in cirrhosis.

THE ANGIOGENIC MAKE UP OF HUMAN HEPATOCELLULAR CARCINOMA DOES NOT FAVOUR VEGF / ANGIOPOIETIN Driven SPROUTING NEOVASCULARIZATION

Wenjiao Zeng1,2, Annette S. Gouw1, Marius van den Heuvel1, Sibrand Poppema1, Nong Zhang2, Inge Plateel1, Koert P. De Jong2, Grietje Molema2; 1Dept. of Pathology & Laboratory Medicine, University Medical Center Groningen, Groningen, Netherlands; 2Dept. of Pathology, Shanghai Medical College, Fudan University, Shanghai, China; 3Dept. Pathology & Laboratory Medicine, University College of Medicine, Kangdong Sacred Heart Hospital, Seoul, South Korea; 4Dept. of HPB Surgery & Liver transplantation, University Medical Center Groningen, Groningen, Netherlands

Background: The first hopeful results of anti-angiogenic treatment of HCC has been announced, yet knowledge regarding the angiogenic status of HCC is still limited. This study investigated the balances in gene and protein expression levels of members of the Vascular Endothelial Growth Factor (VEGF) and Angiopoietin/Tie-2 system that are responsible for angiogenic sprouting of blood vessels. Methods: We studied gene and protein expression levels and cellular localization of VEGF-A, VEGFR-1 and VEGFR-2, Angiopoietin (Angpt)-1 and -2, and their receptor Tie-2 in human HCC from non-cirrhotic and cirrhotic livers, using real-time RT-PCR, Western blot and immunohistochemistry. The data were compared with those in the highly angiogenic human renal cell carcinoma (RCC), and normal liver and kidney. Results: HCC expressed VEGF-A, VEGFR-1, and VEGFR-2 to a similar extent as in normal liver. VEGF-A was mainly expressed by tumor endothelial cells (EC), while their receptors were weakly expressed in the tumor. The Angpt-1 expression was slightly increased in HCC compared to normal liver, while its receptor Tie-2 was strongly downregulated in tumor vasculature. The vessel-stabilization factor Angpt-2, was undetectable in HCC. VEGF-A levels were one order of magnitude higher in RCC than in HCC: there was a 100-fold increase in RCC compared with normal kidney, whereas no differences were seen between HCC and normal livers. Expression of Angpt-2 was > 30 fold increased compared to normal liver, while Angpt-1 expression was decreased in the tumor. As a consequence, Angpt1/2 ratios fell from 3.6 in normal kidney, to 0.06 in RCC. In comparison, in HCC these ratios ranged between 0.4 (non-cirrhotic) and 1.5 (cirrhotic). HCC from non-cirrhotic and cirrhotic background showed similar expression profiles of the angiogenic factors studied. VEGF-A in normal livers was seen in vascular- and sinusoidal EC, in cholangiocytes, but not in hepatocytes. In tumor EC VEGF-A was less pronounced, and tumor cells were negative. In HCC, VEGFR-1 and VEGFR-2 were only weakly expressed in some tumor EC. Angpt-1 cytoplasmic staining was seen in HCC cells and normal hepatocytes, and weak staining was seen in vascular endothelium. Angpt-2 staining was hardly detectable in HCC. In normal liver Angpt-2 positive sinusoidal ECs were present around terminal hepatic venules, while vascular endothelium was weakly expressing Angpt-2. Tie-2 expression was sinusoidal in normal liver and more scattered in HCC. Conclusions: In contrast to findings in RCC, HCC tumor vascularization is likely not VEGF / Angpt/Tie-2 driven.

LOW-DOSE PEGYLATED INTERFERON THERAPY IN COMBINATION WITH TRANS-ARTERIAL CHEMOINFUSION IN HEPATOCELLULAR CARCINOMA PATIENTS WITH MAJOR PORTAL VEIN THROMBOSIS OR EXTRAHEPATIC METASTASIS

Hyun Deok Shin1, Young-Hwa Chung1, Dong Dae Soo1, Sung Eun Kim1, Danbi Lee1, Sae Hwan Lee1, Yoon-Seon Lee1, Myoung Kuk Jang2, Soo Hyung Ryu3, Kang Mo Kim1, Yong Suk Lim1, Han Chu Lee1, Yung Sang Lee1, Dong Jin Suh1; 1Department of Internal Medicine, University of Ulsan College of Medicine, Asan Medical Center, Seoul, South Korea; 2Department of Internal Medicine, Hallym University College of Medicine, Kangdong Sacred Heart Hospital, Seoul, South Korea; 3Department of Internal Medicine, University of Inje College of Medicine, Seoul Paik Hospital, Seoul, South Korea

Backgrounds/Aims: Patients with hepatocellular carcinoma (HCC) associated with major portal vein thrombosis (PVT) or extrhepatic metastases (EHM) have few effective therapeutic options so far. In this study, we intended to examine the safety and efficacy of pegylated interferon (Peg-IFN) therapy in combination with trans-arterial chemoinfusion (TACI) in these patients comparing with TACI alone. Methods: One hundred and twenty consecutive HCC patients with major PVT or EHM [Etiology of underlying liver disease (HBV:HCV:NBNC) = 103:5:12; PVT = 88/120 (73%); EHM = 63/120 (53%); Child-Pugh class (A:B:C) = 94:24:2] were randomly allocated to combined therapy group with Peg-IFN and TACI (n = 60) and TACI group (n = 60). Peg-IFN (PEG-INTRON®, Schering-Plough Corporation, Kenilworth, NJ, USA) was administered at a dose of 50 mcg per week subcutaneously. Cisplatin was infused through the proper hepatic artery at a dose of 2mg/Kg of body weight every 4 or 8 weeks as long as it was tolerable. The subjects were followed with serum biochemistry, alpha-fetoprotein (AFP) levels and spiral CT scan at 4-weeks intervals. Results: Between the groups, there was no significant difference in age, gender, etiology of underlying liver disease, serum AFP level, size or type of HCC, the frequency of major PVT or EHM and Child-Pugh class. In addition to anorexia/nausea/vomiting and mild azotemia, flu-like symptoms, leucopenia or throbocytopenia were also observed in a substantial number of patients in combined therapy group. But, most of them were transient and tolerable. Compared with baseline levels, at 4 weeks after treatment, the median value of serum AFP level was decreased in combined therapy group, but rather increased in TACI group. The proportion of progressive disease evaluated at 4 weeks after the treatments was significantly lower in combined therapy group than TACI group (44% vs. 58%; P<0.05). Consequently, the 1-year survival rate of patients treated with combined therapy was much higher than that of TACI group (46% vs. 18%; P<0.05). Also, the median survival period of combined therapy group was much higher than that of TACI group (38 weeks vs. 25 weeks; P<0.05). Conclusion: Thus, low-dose Peg-IFN therapy in combination with TACI may be a safe and useful palliative treatment in HCC patients with major PVT or EHM.

Disclosures:
Background/ Aims: Cholangiocarcinoma (CC) is a primary malignant liver tumor with poor prognosis, partly because of its poor response to chemotherapy. Recent studies have shown that hepatic progenitor cells (HPCs) play a role in the development of hepatocellular carcinoma (HCC). Moreover, prognosis of HCC with HPCs features is poor. Since HPCs can differentiate into both hepatocytes and cholangiocytes, we evaluated the presence of HPCs and the hepatocyte differentiation in CC. The second aim of this study was to investigate the presence of the ATP-binding cassette (ABC) superfamily of membrane transporters given their possible involvement in chemoresistance of CC. Material and methods: We studied 93 cases of CC by immunohistochemistry for hepatocellular differentiation markers (Hepa, canicular polyclonal carcinomaembryonic antigen (pCEA), CD10), biliary/progenitor cell markers (cytokeratin (CK) 7, CK19 and neural cell adhesion molecule (NCAM)) and the ABC transporters (MDR1, MRP1, MRP3 and BCRP). Results: Thirty-seven (39.8%) cases of CC showed hepatocyte differentiation (CCH). Serum AFP values were significantly higher in CCH than in CC (p=0.0449). The morphological features of hepatocyte differentiation was classified into two patterns: (i) a trabecular pattern which show thick trabecular with little stroma consisting of tumour cells with abundant eosinophilic cytoplasm and mild atypia; and (ii) a cord pattern which show atrophic thin trabecular and/or cord structure of small uniform cells. A trabecular pattern was observed in 17/37 cases (45.9%), a cord pattern in 16/37 (43.3%) cases, and both patterns in 4/37 cases (10.8%). In these areas, CK7 positive intermediate-sized cells which showed a submembranous staining pattern was observed in all cases, a canicular staining pattern of pCEA in 30/32 cases (93.8%), CD10 in 21/29 cases (72.4%) and Hepa in 5/24 cases (20.8%). In addition, cytoplasmic CK7 and/or CK19 positive small round oval cells resembling HPCs were present in all cases and also positive to NCAM in 19/24 (79.2%) cases. These immunohistochemical staining pattern were same in both pattern. BCRP, MRP3 and MRP1 staining showed a basolateral staining pattern and MDR1 showed canicular staining pattern in both pattern, but the expression was down-regulated in comparison with surrounding normal hepatocyte. Conclusion: In our study, about 40% cases of CC showed hepatocyte differentiated features. According to both morphological and immunohistochemical features, these findings strongly suggest a possible HPCs origin of a subset of CC. The fact that MRP1, MRP3 and BCRP are up-regulated, may explain chemoresistance of CC.

Disclosures: The following people have nothing to disclose: Mina Komuta, Sara Vander Borght, Raymond Aerts, Baki Topal, Werner Van Steenbergen, Frederik Nevens, Tania Roskams
Health plan population incidence rates were age-adjusted to the year 2000 standard US population. We identified 716 HCC cases from the selected years. The median age at diagnosis was 63 years; 71% of cases were men; 47% were non-Hispanic white and 29% were Asian. The age-adjusted yearly incidence of HCC rose steadily from 31 per million in 1997-8 to 46 per million in 2004-5. The proportion of cases in which viral hepatitis B and C had not been evaluated dropped from 27% in 1997-8 to 11% in 2000 and all later years studied, and may in part explain the corresponding 1.5-fold increased incidence of viral-hepatitis-related HCC. Although the absolute numbers were small, the incidence of apparent FLD-associated HCC increased more than ten fold from 0.3 per million in 1997-8, to 4.6 per million in 2004-5. This increase was not attributed to changes in surveillance and testing for the factors defining a FLD diagnosis. The proportion of HCC for which an etiology could not be determined varied between 16-25% in the study years. Fluctuations, but no chronologic trends, were found in the relative contributions of hepatitis B (15-22%), of hepatitis C (33-46%), and of alcohol with no viral component (10-20%) to HCC. However, the proportion of HCC cases with probable FLD and no other discernable CLD rose from 1% to 10% during the study years. In this diverse population, HCC incidence rates increased by over 50% in 8 years. The trend was due to a modest increase in the incidence of viral-hepatitis-related HCC, and in part to steadily increasing rates of HCC apparently related to FLD.

HIV-INFECTED PATIENTS WITH HEPATOCELLULAR CARCINOMA HAVE WORSE SURVIVAL PROGNOSIS THAN UNINFECTED PATIENTS ADJUSTED BY BCLC STAGE

Antonio Diaz-Sanchez1, Ana Matilla1, Oscar Nuñez1, Pilar Miralles2, Jose Antonio Pajares1, Beatriz Merino4, Judith Gomez4, Cecilia Sanz4, Juan Berenguer2, Rafael Bañares2, Gerardo Clemente2

1Liver Unit, Hospital General Universitario Gregorio Marañón, Madrid, Spain; 2Infectious Diseases Department, Hospital General Universitario Gregorio Marañón, Madrid, Spain

HAART has changed the natural history of liver disease in HIV-infected patients. Although hepatocellular carcinoma (HCC) in non-HIV patients is well described, few data are available of HCC in HIV-infected persons. AIMS AND METHODS: The aim was to assess the survival of HIV-seropositive patients with HCC and to compare them with HIV-seronegatives. A retrospective analysis from October 1998 until January 2007 in a single tertiary care center found 25 HIV(+)/HCC patients. Controls were 99 consecutive assisted HIV(-)/HCC patients. The main clinical and epidemiological characteristics of patients with HCC were described and their survival was compared between HIV-positive and uninfected subjects. Survival was evaluated by Kaplan-Meier curves and compared by log-rank test. RESULTS: HIV(+)/HCC patients had a mean CD4+ cell count of 309 ± 229/mm3 (28% < 200) and a median HIV RNA load of 162,5 copies/mL (undetected in 48%). Eight patients (32%) had AIDS disease. The main H$\text{I}$V infection way was through intravenous drug use. In HIV(+) tumor was solitary in 8 (32%) patients, multinodular in 7 (28%) and diffuse/massive in 10 (40%). In 64% of patients tumor size was > 5 cm, both liver lobules were affected in 24% and portal vein invasion was present in 36%. Four patients (16%) had extra-hepatic metastases. HIV(+) HCC patients were younger than HIV(-) controls (45.5 ± 4.6 vs 69.6 ± 9.4 years; p=0.001), had more viral etiology (100% vs 70%; p=0.001) mainly due to hepatitis C infection (84% vs 64%; p=0.062), and had more advanced Child-Pugh grade (A grade 36% vs 67%; B-C grade 64% vs 33%; p=0.001). BCLC stage was more advanced in HIV(+)/HCC patients than controls (A stage 16% vs 60%; B stage 12% vs 19%; C stage 36% vs 20%; D stage 36% vs 1%; p=0.001). The median overall survival was 11,1 ± 10,9 months in HIV(+)/HCC patients compared with HIV(-) controls (36,5 ± 3,7 months; p= 0.001). Adjusted by BCLC stage a significant decreased survival in CD stage HIV(+)/HCC patients compared with HIV-seronegatives was observed (1 ± 0.01 vs 10.2 ± 3.3 months; p = 0.008). The HIV RNA load, CD4+ cell level or AIDS disease had no influence in the survival analysis. CONCLUSIONS: HIV-seropositive patients who develop HCC have a younger age, a more severe liver disease and worse survival prognosis than uninfected patients adjusted by BCLC stage.

ORAL SUPPLEMENTATION WITH BRANCHED-CHAIN AMINO ACIDS IMPROVES SURVIVAL AND RECURRENCE-FREE SURVIVAL AFTER SUCCESSFUL TREATMENT OF HEPATOCELLULAR CARCINOMA IN PATIENTS WITH CIRRHOSIS: A PROSPECTIVE STUDY

Koaru Tsuchiya, Yasuhiro Asahina, Itsuko Hirayama, Mitsuaki Sato, Tomohiro Tanaka, Nobutoshi Komatsu, Naoki Umeda, Takanori Hosokawa, Ken Ueda, Hiroyuki Nakashita, Jun Itakura, Masayuki Kurosaki, Masakatsu Uchihara, Shozo Miyake, Namiki Izumi; Gastroenterology and Hepatology, Musashino Red Cross Hospital, Tokyo, Japan

BACKGROUND: Oral supplementation with branched-chain amino acids (BCAA) is reported to improve event-free survival, serum albumin concentration, and QOL in patients with cirrhosis without hepatocellular carcinoma (HCC). BCAA have shown to improve insulin resistance and protein synthesis in vitro by stimulating the pathway involving mammalian TOR. Although, improvement of insulin resistance using BCAA may result in suppressed hepatocarcinogenesis, the clinical efficacy in preventing development of HCC recurrence is unclear. AIM: To determine whether long-term oral supplementation with BCAA can prevent HCC recurrence after curative treatment for initial HCC and improve survival. METHODS: A cohort of 235 patients with HCC who were successfully treated with radiofrequency ablation (RFA) as an initial curative therapy were prospectively analyzed (mean age 67 yrs; M/F = 147/88; HCV/HBV/Others = 188/20/27; Child A/B = 191/44). Patients were divided into two groups: A BCAA group (12 g/day) and a diet therapy alone group (matched daily energy and protein intake). The cumulative survival and recurrence-free survival rates were analyzed by the Kaplan-Meier method, and the factors associated with survival were determined by the Cox proportional hazard model. RESULTS: The rate of first or second recurrence of new foci of HCC was similar between the two groups; however, the rate of third recurrence was significantly lower in the BCAA group (logrank test: p = 0.02). Among patients with lower albumin level (below 3.5 mg/dL), the cumulative survival rate after initial RFA was significantly higher in the BCAA group compared with the diet alone group (at 3 and 5 years: 100% vs. 67% and 73% vs. 41%, logrank test: p = 0.02). In contrast, no significant difference between the two groups was found in patients with higher albumin level (3.5 mg/dL or more). Univariate analysis used to characterize BCAA supplementation (hazard ratio, 3.6; 95%CI, 1.1-12), alpha fetoprotein higher than 100 ng/mL (hazard ratio, 7.5;

365 SEPARATE ANALYSIS OF INTRANODULAR BLOOD SUPPLY IN NODULAR LESIONS ASSOCIATED WITH LIVER CIRRHOSIS: A NOVEL ULTRASOUND TECHNIQUE “PURE ARTERIAL PHASE IMAGING”
Masatoshi Kudo, Kinuyo Hatanaka, Yasunori Minami, Hiroshi Tei, Kiyoshi Maekawa; Kinki University School of Medicine, Osaka, Japan

Background and Aim: It is well known that premalignant nodular lesions associated with liver cirrhosis such as low grade dysplastic nodules (LGDN) and high grade dysplastic nodules (HGDN) are supplied by portal venous flow, whereas overt hepatocellular carcinoma (HCC) is supplied by pure arterial flow. Until now, separate detection of intranodular blood supply is possible only by CT during hepatic arteriography (CTHA) and CT during arterial portography (CTAP). In this study, we investigated the usefulness of newly innovated ultrasound technology “Pure Arterial Phase Imaging”, which permits separate analysis of intranodular blood supply. Materials and Methods: A total of 50 overt HCCs, 10 LGDNs, and 5 nodule-in-nodule type HCCs were included in this study. Pure Arterial Phase Imaging was performed as follow; 1) Injection of ultrasound contrast agent, Levovist or Sonazoid; 2) Performance of the contrast-enhanced ultrasonography (CEUS), 3) Storage of the “raw data” of CEUS in the GE LOGIQ 7 ultrasound machine, 4) By reviewing the raw data of CEUS study, range of interests (ROI) were set on the extranodular arterial vessel and portal venous vessel, 5) Pure arterial phase was automatically calculated by the time-intensity curves of the 2 ROIs, 6) Accumulation or capture images of maximum intensity projection (MIP) were obtained in order to evaluate whether intranodular blood supply is arterial origin or portal venous origin. Results: Arterial supply was proved in all of 50 HCC nodules, which was consistent with dynamic CT findings. Portal supply was proved in all of 10 dysplastic nodules, and this finding was consistent with that obtained by CTAP. Arterial supply within portal supply pattern was clearly demonstrated (nodule-in-nodule pattern) by Pure arterial phase imaging, and this finding was completely compatible with the findings on CTHA and CTAP. Conclusion: Newly innovated technology “Pure Arterial Phase Imaging” can clearly reveal the origin of intranodular blood supply, which permits definitive diagnosis of premalignant lesions (LGDN, HGDN, and nodule-in-nodule type HCC) and overt HCC. Since CTHA and CTAP are invasive technique, this non-invasive technique “Pure Arterial Phase” imaging may be able to replace both CTHA and CTAP.

366 GENOME-WIDE MOLECULAR PROFILES OF HCV-INDUCED HEPATOCELLULAR CARCINOMA
Gisèle Nkontchou1, Tin tin Mynt Htar1, Vladimir Lazar2, Hugues Ripoche2, Thomas Ripoche2, Philippe Dessen2, Jean Claude Trinchet1, Michel Beaugrand1; 1Liver Unit, Bondy, France; 2Fonc-tional Genomics, Institut Gustave Roussy, Bondy, France

Identification of genomic changes linked to the occurrence of HCC in patients with HCV cirrhosis is important to understand the pathways of hepatocarcinogenesis in these patients. Therefore we compared the gene expression profiles in the liver of patients with HCV cirrhosis according to the occurrence or not of HCC during the short term follow-up. Patients who developed HCC in the 5 years following liver biopsies were compared with patients who did not. Both groups were matched for age and sex. All patients had active viral infection and belonged to Child-Pugh class A. As a whole, 17 liver specimens (G1) of patients who did not develop HCC were compare to 13 liver specimens (G2) of patients who develop HCC during the following 5 years. Using the BRB Array Tools software, of the 22 442 genes tested we identified 194 genes as differentially expressed (according to a p-value < 0.03 for T-test with random variance model). Most of them appear to be involved in angiogenesis, matrix metalloproteinase activation, immune response (up-regulated) or sialidation (down-regulated). Leukocyte extravasations signaling was the most discriminant metabolic signaling pathway (up regulated) in patients who develop HCC. Conclusion. Genes expression involved in regulation of angiogenesis, metalloproteinase activation, immune function, N-Glycan degradation are implicated in hepatocarcinogenesis in HCV cirrhosis. This finding highlights the role of stromal interaction in hepatocarcinogenesis.

367 THE MELD BASED OBJECTIVE SCORING SYSTEM (MOSS): NEW INSIGHT INTO RISK STRATIFICATION OF CIRRHOTIC PATIENTS WITH HEPATOCELLULAR CARCINOMA
Swee H. Teh1, Susan L. Orloff1, Brett C. Sheppard1, Jonathan M. Schwartz2, John Kaufman3, Steve Cha5, Raymond Kim4, Patrick S. Kamath4, David Nagorney2; 1Surgery, Oregon Health & Science University, Portland, OR; 2Gastroenterology and Hepatology, Oregon Health and Science University, Portland, OR; 3Interventional Radiology, Oregon Health and Science University, Portland, OR; 4Gastroenterology and Hepatology, Mayo Clinic, Rochester, MN; 5Surgery, Mayo Clinic, Rochester, MN

Introduction: The MELD scoring system is a validated tool to ascertain short term survival in patients with cirrhosis. There is lack of a consensus on an ideal model to predict prognosis among patients with cirrhosis and hepatocellular carcinoma (HCC) treated with modalities other than liver transplantation. We therefore conducted a survival analysis and developed a novel MELD-based objective scoring system (MOSS) to stratify survival of HCC patients treated with non-liver transplant modalities. Methods: A retrospective analysis of 204 patients with HCC diagnosed between 1994 and 2004 was performed. Ninety patients were treated with transarterial chemoembolization (TACE) and 114 patients were treated with hepatic resection. Objective clinical variables that determined survival were obtained using a Cox proportionate hazard regression model. Results: The mean MELD score and tumor size for the
TACE and hepatic resection group were 10.7 vs. 9 and 5.2 cm vs. 5 cm, respectively. The median survival for the TACE group was 1.2 years and the hepatic resection group was 1.9 years. In a multivariate analysis, both MELD score and tumor size were significant predictors of survival in both the TACE and the resection groups. MELD score, tumor size, portal vein invasion and tumor multiplicity were each allocated points for incorporation into the scoring system. Three subgroups were then derived from the MOSS, based on their total points. Table 1 demonstrated the median survival for MOSS Group I, II and III in patients treated with TACE and hepatic resection. Conclusion: MOSS, a scoring system that combines MELD and tumor characteristics, accurately stratifies outcomes in cirrhotic patients with HCC treated with TACE or hepatic resection. The parameters used in MOSS are objective, non invasive and readily available clinically. If validated, this scoring system would be important in predicting clinical outcomes, optimizing resource utilization and designing trials of novel treatments.

368 SEMIANNUAL SURVEILLANCE FOR HEPATOCELLULAR CARCINOMA IMPROVED PATIENT SURVIVAL COMARED TO ANNUAL SURVEILLANCE (KOREAN EXPERIENCE)

Do Young Kim1,2, Kwang Hyub Han1,3, Sang Hoon Ahn1,3, Yong Han Paik1,2, Kwan Sik Lee1,2, Chae Yoon Chan1,2, Young Myoung Moon4; 1Internal Medicine, Yonsei University College of Medicine, Seoul, South Korea; 2Institute of Gastroenterology, Seoul, South Korea; 3Liver Cirrhosis Clinical Research Center, Seoul, South Korea; 4Internal Medicine, Kwandong University College of Medicine, Goyang, South Korea

Background/Aims: The use of a surveillance interval of 6 months is recommended for the early detection of hepatocellular carcinoma (HCC) in high risk patients. Previously, Italian investigators reported there was no difference of patient survival between semiannual and annual surveillance in cirrhotic patients. The aim of this study was to elucidate whether semiannual surveillance for HCC affected the clinical outcomes of patients diagnosed with HCC, compared with annual surveillance in Korea. Methods: Between May 1990 and December 2004, a total 400 patients (M:F = 2.6:1) were diagnosed with HCC by surveillance program [ultrasound examination and alpha-fetoprotein (AFP) measurement every 6 or 12 months]. These patients were divided into two groups according to surveillance interval; Group 1 (semiannual, n=219) and Group 2 (annual, n=181). The characteristics of HCC identified and overall patient survival were analyzed and compared between these two groups. Results: The mean age of all patients was 57 years. The etiology of HCC was hepatitis B virus in 289 (72.3%) patients, hepatitis C virus in 76 (19.0%), and non B- non C in 32 (8.0%). AFP levels were ≥400 ng/mL in 109 patients (27.3%), and <20 ng/mL in 147 (36.8%). In comparison between two groups, single nodular HCC was more prevalent in Group 1 than in Group 2 (90.4% vs. 72.9%, P<0.001). On the contrary, diffuse type HCC was more common in Group 2 (4.1%, vs. 11.6%, P<0.001).The frequency of solitary HCC ≤3cm was significantly higher in Group 1 compared with Group 2 (62.1% vs. 51.5%, P=0.003). The application of curative treatments such as resection or local ablative therapy was more frequent in Group 1 compared to Group 2 (18.7% vs. 12.2%, P=0.03). Five-year survival in Group 1 was significantly better than that of Group 2 (25% vs 16%, P=0.006, log-rank test). Conclusion: Our data show that semiannual surveillance resulted in the detection of HCC at an earlier stage and improved survival compared to annual surveillance in Korea.

369 PROSPECTIVE EVALUATION OF STAGING SYSTEMS FOR HEPATOCELLULAR CARCINOMA DETECTED DURING SURVEILLANCE OF CIRRHOTIC PATIENTS

Angelo Sangiovanni1, Mauro Viganò1, Massimo Iavarone1, Alessio Aghemo1, Bruno Cesana2, Gian Maria Prati1, Matteo A. Manini1, Raffaella Romeo1, Massimo Colombo1; 1A.M. & A. Migliavacca, First Division of Gastroenterology, Fondazione IRCCS Maggiore Hospital Policlinic, Mangiagalli & Regina Elena, University of Milan, Milan, Italy; 2Unit of Medical Statistics and Biometry, University of Brescia, Milan, Italy

Background: The role of staging systems for hepatocellular carcinoma (HCC) was never prospectively evaluated in cirrhotic patients with HCC detected during surveillance. Aim: We prospectively evaluated the impact of BCLC, CLIP and GETCH staging systems in predicting the outcome of cirrhotic patients with HCC detected during a surveillance program. Patients and methods: Between 1997 and 2005, among 1383 cirrhotic patients (Child-Pugh A/B), HCC was detected in 248, 173 (70%) males, mean age 65 yrs (range 43-76), 211 (85%) patients (27.3%), and <20 ng/mL in 147 (36.8%). In comparison between these two groups. Results: The mean age of all patients was 57 years. The etiology of HCC was hepatitis B virus in 289 (72.3%) patients, hepatitis C virus in 76 (19.0%), and non B- non C in 32 (8.0%). AFP levels were ≥400 ng/mL in 109 patients (27.3%), and <20 ng/mL in 147 (36.8%). In comparison between two groups, single nodular HCC was more prevalent in Group 1 than in Group 2 (90.4% vs. 72.9%, P<0.001). On the contrary, diffuse type HCC was more common in Group 2 (4.1%, vs. 11.6%, P<0.001).The frequency of solitary HCC ≤3cm was significantly higher in Group 1 compared with Group 2 (62.1% vs. 51.5%, P=0.003). The application of curative treatments such as resection or local ablative therapy was more frequent in Group 1 compared to Group 2 (18.7% vs. 12.2%, P=0.03). Five-year survival in Group 1 was significantly better than that of Group 2 (25% vs 16%, P=0.006, log-rank test). Conclusion: Our data show that semiannual surveillance resulted in the detection of HCC at an earlier stage and improved survival compared to annual surveillance in Korea.

months (range 1-107), the yearly mortality rate was 12.1%. By univariate analysis, age (p=0.012), etiology (p=0.01), Child-Pugh (<0.0001), performance status (p=0.0001), BCLC (p=0.0001), CUP (p=0.012), and GETCH (p=0.002), were significantly related to survival. BCLC system had the best homogeneity among patients in the same stages (LHR Chi-square = 18.9), the highest discriminatory power (linear trend = 22.2), and the lowest AIC (737.0), indicating the best stratification power. By multivariate analysis, age (p=0.001), Child-Pugh (p=0.0001), BCLC (p=0.0006), and GETCH (p=0.035) were the only variables independently related to survival. When multivariate analysis was performed stratifying for the treatment received, Child-Pugh (p<0.0006) and GETCH (p=0.022), were the only variables related to survival. Conclusions: GETCH and BCLC are both independent predictor of survival in cirrhotic patients with HCC diagnosed during surveillance program. GETCH has the best predictive value after treatment choice.

370 HEPATOCELLULAR CARCINOMAS (HCC) IN PATIENTS WITH METABOLIC SYNDROME: A ROLE FOR MALIGNANT TRANSFORMATION OF TELANGIECTATIC ADENOMAS?

Valerie Paradis1, Stephane Zalinski2, Francoise Degas3, Pierre Bedossa1, Jacques Belghiti2; 1Pathology, Beaujon hospital, Clichy, France; 2Hepato-biliary surgery, Beaujon hospital, Clichy, France; 3Hepatology, Beaujon hospital, Clichy, France

Metabolic syndrome (MS) is a well-known risk factor for chronic liver disease and HCC. Higher prevalence of MS is associated with a significant increase in HCC. The aim of the study was to report the pathological features of HCC and background liver tissue in patients having MS as the only risk factor for liver disease. Twenty-eight patients with MS underwent liver resection for HCC in a single center and were retrospectively studied. Other potential etiological factors of HCC were ruled out. Tumor features including size, differentiation grade, presence of capsule, satellite nodules and vascular invasion were reported, as well as characteristics of the non-tumoral liver: fibrosis was staged according to Kleiner: 0: no fibrosis, 1: perisinusoidal or periportal fibrosis, 2: perisinusoidal and periportal fibrosis, 3: bridging fibrosis and 4: cirrhosis, presence of steatosis and steato-hepatitis. Results: All patients were caucasian males with a mean age of 68 ± 8 years. Mean BMI was 30±5. Dyslipidemia, diabetes, obesity, and hypertension were present in 61%, 75%, 79%, and 82%, respectively. Mean size of HCC was 86±12 mm (20-350 mm). Most of the patients had a unique HCC (n=22, 79%). Histological analysis of the tumor showed presence of a capsule in 71% of cases. In 12 patients, vascular invasion was noted. Presence of satellite nodules was observed in 9 cases (32%). HCC was well and moderately differentiated in 22 and 6 cases, respectively. Adjacent liver showed significant fibrosis (stage >3) in 10 patients (35%), with 7 patients having cirrhosis. Significant steatosis (≥30%) and steato-hepatitis were observed in 19 (65%) and 4 (14%) patients, respectively. When pathological characteristics of the HCC were compared according to the presence of fibrosis in the adjacent liver, size of tumor was significantly smaller in the group of significant fibrosis (54±8 mm versus 104±17 mm, p=0.01). In the same group, HCC were less differentiated than in the group without significant fibrosis (40% versus 16 % of moderately-differentiated). No difference was observed regarding preexistence of satellite nodules or vascular invasion. In the group of HCC occurring on normal liver, 5 out of 18 (28%) arised on a pre-existing liver cell adenoma, 3 of them being telangiectatic adenomas (TA). Conclusion: HCC in patients with MS predominantly develop in the absence of significant fibrosis. Since TA are often associated with MS (Paradis V et al, Hepatology in press), and remnants of TA are observed inside HCC in some of these cases, one may suggest that malignant transformation of TA might be the most relevant pathway of HCC development in the context of MS.
